foundation of civilization of this country as it has been in the countries occupied by the human race everywhere, and I hope that Congress will give it that due consideration to which it is entitled, for in the end it is the safety for capital. Because if agriculture is not fostered, if the country does not build up upon that foundation of citizenship for protection, what is the capital worth? What are the great institutions of this country worth if they are in danger of being destroyed? Because the day will come when these people, not knowing what our principles of government are, being forced by starvation, being forced by necessity, will rob the capitalists, and then they will wish they had the protection that would have given a fair degree of advantage to agriculture to make this country prosperous.

Mr. Mercer and Mr. Spiller will follow me. I am anxious to have these gentlemen speak, because they represent all of the interests.

I thank the committee for hearing me.

STATEMENT OF J. H. MERCER, TOPEKA, KANS., REPRESENTING KANSAS LIVE STOCK ASSOCIATION.

Mr. MERCER. I represent the Kansas Live Stock Association at this hearing.

The CHAIRMAN. Will you go ahead and state your views concerning the questions before the committee?

Mr. MERCER. Mr. Chairman, I did not come to Washington to appear before this committee in the interests of tariff legislation, but being here it was suggested by Judge Cowan that I might leave a thought or two with you that would be of consequence. I am not in the habit of appearing before committees or speaking in public but what I have to say to you will be from the experience of a farmer. I have spent all of my life in agricultural pursuits. Fifty-odd years or more I have spent on the farm and know some little about what the farmers have to go through with.

My observation, as I have gone down through my life, has been that farmers built up this country, moved along in a fair way. During the early history and on down to a few years ago, and for a period of 10 or 15 years prior to the World War, it seemed that the farmers of the United States were coming into their own, in a way. They were more or less prosperous, a great many of them, and they availed themselves of privileges of modern life, different, of course, from what they had been accustomed to in the early history of the country.

When the war came on there came a change, and that change has disturbed the agricultural life in the United States, and I speak from that experience. Take, for instance, the people of my own State—Kansas—and I am mighty glad that I can say that I am not here to-day to urge upon the Representatives of this Congress from our State to support tariff measures in the interest of agriculture. Our delegation is solid in that direction. But I hope what I say here to-day will be of benefit to those who might not know the exact situation of the farmer.

At the beginning, I say, after the war the farmers in our own State, and largely in the Middle West and the western country, were a fairly prosperous people. They responded, I think, to the call of this Government perhaps as earnestly and as patriotically as any class

of our citizens. But as a result of the war, no doubt, there has been brought about a condition in the agricultural life of our country that is deplorable. The activities of the Government and the Government's demand upon agriculture for its support during a time of ıeed has created such a condition that it now seems to be necessary 'or the farmers of this country to come to the Congress and tell them)f their deplorable situation.

Men who have been prosperous, builded up homes for themselves, ınd educated their families, have been put out of business. I am not :xaggerating, gentlemen, when I say that if the farmers of our ection, at least, were required to liquidate their debts to-day, 75 per ent of them would be unable to do so, even though they should acrifice all their property of every description, and that condition ıas been brought about through the depression of the value of their roperties.

I will illustrate in answer to the question of Senator Curtis a while go on the cost of some of these things that enter into the farm life, nd more particularly live stock. The live stock, especially cattle, produced during a period of from 1 to 4 years. We take our cow erd on the farm and start the production of our steers with the age f cows running from 2 to 6 years. After they pass the age of 6 or 7 ears they are not so prolific and are usually disposed of soon thereter. The steer is produced and fed on the farm for a year or two, ıen fattened either where he is produced or shipped to some other cality and prepared for beef.

So you can see that the production of live stock especially to-day ı our farms has all virtually originated and come into the farm life nce the inflation of prices brought about as a result of the war.

After the armistice was signed in 1918 there was but little reduction values of any farm commodities until the beginning of 1919. nce that time there is nothing produced on the farm which has not preciated in value more than half, and sometimes—in a great any instances—two-thirds of the values during the high peak of e war period in 1917–18.

That is not so with everything that the farmer has to buy; it is t so with most everything with which he has to do. Just the verse. His interest charge has increased something like 30 per nt. even since 1918. Prices of all of his farm equipments have mained very nearly at war-peak prices, clothing and shoes and erything with which he has to deal have kept up at a high level, d he has been called upon to meet the obligated debts that he curred in order to expand and comply with the demands of his untry with the liquidation of the low value of the output of the m. and that has been impossible.

So, gentlemen, it has placed him in a desperate position. I would t be here making that statement if I did not know what I was lking about, and I believe I have tried to acquaint myself with the nditions in a large section of my country. I have attended several arings before the examiner of the Interstate Commerce Commission the question of the reduction of rates, and I have heard the sworn stimony of men given from the Northwest country, the Middle est, and the South and the Southwest, and there is no doubt that e conditions prevail in every agricultural section of the country. it is that condition which has aroused the people to come to you

in order to see if there are things which can be done to relieve that situation.

To illustrate, in answer to questions I mentioned a moment ago. It costs to produce a 3-year-old steer, taking him from the cheapest production ranges of the Southwest, beginning back in 1917-18 down to 1920-21, with the best figuring possible, $130 to $135 per head. I have not the detailed figures with me, but Mr. Spiller may have them. But in a general way I would say that from $120 to $135 per head, regardless, now, of whether the stockman produces them here on the farm and follows them up step by step to the pastures of our State, and then on to the feed lots of our own and the other corn-belt States, or whether he sells them—it is immaterial, because the figures are just the same.

In 1918 beef steers were selling at from $16 to $18 per hundredweight for a fairly well-finished bullock. During the last 10 or 12 months that steer has been selling at from $6 to $9 per hundred.

Senator La Follette. About what weight are they turned off so we can get it in value of the individual?

Mr. Mercer. They are turned off at various weights. I am speaking now of the 3-year-old steer.

Senator La Follette. Yes.

Mr. Mercer. He would be turned out at a weight, we will say on a general average, of about 1,200 pounds, depending largely on how he was handled from the time he was a calf until he was made ready for the block. If he was brought from our range country into the market at Kansas City, we will say, and bought by an Iowa feeder and shipped up into Iowa, fed six or eight months on grain he would probably weigh 1,400 or 1,500 pounds, depending, of course on conditions.

But you can see what the producer is losing in every step regardless, I say, of whether he is the original producer of the calf or whether or not he passes his steer into the middleman's hands and into the feeder's hands before he reaches the market.

Those are natural conditions that do not apply so much to the hog business. It is true that the only thing, gentlemen, that the farmer can look to, or has been able to look to, with any degree of breaking even in any manner is the hog business and the poultry business.

I was very much interested in the discussion here this morning. It was surely educational to me. My experience as a poultry man has been that when I was on the farm my wife took care largely of our broods—our family and the chicken's family—and we usually kept on hand 125 hens on our farm, and I never figured that the 125 hens were any cost to me at all. What little labor my wife did or what little labor performed by the hired help was all the cost because the hens rustled for themselves, usually. So we always felt that the chickens we sold and the eggs we sold, after keeping what we needed ourselves, were really a clear surplus of our farm production. But, of course, with the men who enter into the poultry business it is a different proposition, as I can see, and Prof. R[illegible] statement here this morning was very educative to me, I am sure.

I have illustrated the conditions out there in our country. I [illegible] not understand why Republicans should have to come before

epublican Congress and ask for a protective tariff on anything in ne United States. I am not a student of the tariff, but I have ved a long while now. I remember away back when I was a young ian that that was the great slogan of the Republican Party—proection to our manufacturing industries especially, and to ourAmeran labor, etc.

Gentlemen, I think the time has come that if the tariff means nything on earth to the United States it surely should mean protecon to American agriculture.

I believe conscientiously that every article produced from the merican farms should be safeguarded by a protection of some nount. I do not believe that it means anything so far as the cost the consumer is concerned, not a thing. A few cents a pound otective duty on hides, a few cents a pound on beef, does not mean nything to the consumer in this country.

I will admit that there are conditions in this country that I can ot analyze as to why there should be such a spread between what e as producers grow in the way of the food of life and what this an over here [indicating], who is occupied in some other walk of e, has to pay for the farm products he consumes. For instance, do not know what you people pay, but last summer many of the rmers in Kansas sold their eggs from the farms at 10 cents a dozen. know that to be true, because we purchased them. We would ive out in the country and would purchase eggs from farmers at cents a dozen. I know at the same time that our neighbors in ir little city of Topeka, where I live, were paying 20, 22½, and 25 nts a dozen at the grocery stores and retail establishments for eggs. Those things are handled just like meat. The farmer produces e eggs. He takes them in to his merchant. He trades the eggs, rhaps, for something he needs in his family, and the merchant lows him the price of, say, 10 or 12 cents at that time. Then they e transported on to the distributing points, like Kansas City, and aced in cold storage at about that price, and where they go from ere, of course, I am not supposed to know. I am not competent go into that. But by the time, I presume, that they reach the nsuming public in the eastern cities the price has been raised to mewhere around 50 or 60 cents, and maybe 70 cents, per dozen. iere is a spread that is too great.

Senator CURTIS. Did you not at one time look into the spread d the cost of beef here in the city of Washington?

Mr. MERCER. Yes, sir.

Senator CURTIS. Would you mind telling the committee what you und?

Mr. MERCER. I will answer that, Senator, by saying that we made o investigations. Prior to the war, I think in 1912, we made an vestigation in 60 towns in our own State as to the spread between e manufactured articles and what the consumer was paying over e block, and we found that percentage was 101 per cent. To ustrate that briefly, I would say that if the butcher paid 9 cents a und for his bullock to the packer, or that it cost him 9 cents if he ught and butchered the animal himself, the consuming public paid cents on the average for the pound of beef sold.

At the time Senator Curtis alludes to, a committee of our organizaon was sent east to make an investigation of the eastern markets.

It was a committee of five that visited Boston, New York, and Philadelphia, and the City of Washington, and we traced through the packing centers of Kansas City and Chicago to the distributing markets of these various cities, and secured the cost of the various cuts of beef laid on the block by the manufacturer to the retailers in the cities, and then made an investigation as to what the consuming public was paying for our product, and I do not just remember the exact percentage, but it was very close to 100 per cent that the consuming public in the East was paying above the price at which the manufacturer was laying that meat on the blocks to the retailer.

That, I think, has been gone over before some of the committees here very thoroughly, and the actual data given. I did not bring with me, as I say, any data on these points, because I did not thi of appearing here. But that was about the approximate percentag of cost the consuming public was paying in excess of what it cost t produce the beef, and also what it cost to manufacture the beef.

Senator JONES. Mr. Mercer, I just want to see if I have it righ that the retailer charges about 100 per cent for handling the mea over the original cost to him?

Mr. MERCER. Yes, sir; that was demonstrated fully in our inves gations in the West, and I would not say positively whether it wa quite that much in the East.

Senator LA FOLLETTE. How long ago was that made, Mr. Merce

Mr. MERCER. The investigation we made in our State was in 191 and the investigation we made here in the east was in 1918–19.

Senator CURTIS. My recollection, Mr. Mercer, was at that time th the difference on the block, where hung in the freezers down he in the markets, cost 16 or 18 cents, and they were selling the cheap cuts at about 30 cents and the high cuts at 79 cents.

Mr. MERCER. That was about right. But as a general averag of course—when we take the soup bones and the neck and all th part of the bullock, that is classed as the cheap cuts of the beef, t reduces that percentage quite a little. I know in one particul instance I made a statement before a committee here that the whol saler delivered liver to the retailer in the City of Washington at cents a pound, and he retailed it at 30 cents. We had figures and t name of the place, and everything of that kind.

Senator LA FOLLETTE. Did you find back in 1912 when you ma the investigation in your own State that the retailer was taking large a percentage of the profits as he was taking in 1918–19, wh you made the investigation in the East?

Mr. MERCER. Just about the same. Now, at this time I will he is taking more, for several reasons: There are so many peo engaged in the retail business; so many people engaged in the d tribution of these food products, and especially in the smaller to of our section of the country. The volume of business has decrea so tremendously that they have even got to hold these prices up t higher level than heretofore in order to come anywhere near breaki even. That is the condition out there, because there has b destroyed in this country the purchasing force of American agri turalists. The farmers are not buying, in the first place, or they b but little, and wherever they possibly can are getting along with purchasing any of the comforts of life that they would like to ha under ordinary conditions and would buy under ordinary circu

tances. So the decrease in demand affects the country town and he small places much more, perhaps, than it does our larger cities, here industrial life is quite active.

I do not know, Senators, that I have anything further to say. If here are any questions to be asked me, I would be mighty glad to ell you anything I know from my viewpoint as a farmer.

Senator JONES. Mr. Mercer, from your study of the retail trade, it your thought that this large percentage of excess over cost must e charged to the large number of retail establishments and the verhead and other costs of maintaining so many retail establishents?

Mr. MERCER. Absolutely; that is my viewpoint of the situation.

Senator CURTIS. I asked you the question regarding what you said moment ago about how little the duty would affect the retail price; iat is why I wanted it in the record.

Mr. MERCER. How is that?

Senator CURTIS. I asked you to answer the question as to what ou found, because I understood you to say a few minutes ago that hat little duty might be imposed would not affect the price very uch.

Mr. MERCER. I do not think it would. To answer your question, enator Jones, I think that is absolutely the situation with regard to great many of the commodities with which we deal now. We have store on this corner and a store on that corner, and one on that rner in every little town, where one thrifty, active business would ke care of the whole situation. They have got to pay overhead, ey have got to pay for upkeep. Some people say it destroys comtition to have but a few stores, but there is no competition where istence is at stake and it is the volume of business which regulates e costs. You take in a great many instances where men have a ge volume of business in these particular lines, and they are ally profiteering. And here [illustrating] may be the man who s a small volume of business in the same line, and it is no trouble r him to show he was running behind financially. I do not know w these things can be corrected. Of course, I do not think that up to Congress to correct, but it is a condition that prevails in the nited States, and it will have to be corrected in some way, because causes the living expense to be too great.

Senator JONES. Mr. Mercer, you rather indicated that you did not ink the tariff would increase the price on these commodities to the nsumer. Is that the theory on which the merchant is selling his oduct for all he can get regardless of what it cost? If the tariff erated so that it raised the price at all somebody would have to y it?

Mr. MERCER. Yes; it naturally would be so. But the tariff would so small, so inconsiderable at the time that it would reach the nsuming public that it would not affect the general line of business.

Senator JONES. Let us take beef. I believe we are asked to put a iff of 4 cents a pound on beef. Would the effect of such a tariff to raise the price of beef 4 cents a pound anywhere?

Mr. MERCER. I do not think so.

Senator JONES. Why not, Mr. Mercer?

Mr. MERCER. Well, because the supply and demand would be the ntrolling factors. If we were producing a plenty in this country

to feed our people, that 4 cents a pound would have no effect whatever on what the public would pay for the meat.

Senator JONES. That is because we do produce in this country a sufficient supply of meat and we export meat to some extent?

Mr. MERCER. Yes; we export a considerable amount of meat.

Senator JONES. Then what, in your opinion, would be the beneficent effect to the producer out of a tariff on meat?

Mr. MERCER. Well, I think it would be this: We have had hides brought into this country without any duty for some time without reducing the price to the buyer of shoes or harness.

Senator JONES. I can see how a duty on hides would help, because we import a vast quantity of hides.

Mr. MERCER. I hardly know how to answer you, but will just illustrate my position in this way: The meats imported must come into this country in a different condition from that in which we produce them. They come in in a frozen condition, and only reach our seaboard towns and cities—those particular points where the greatest consumption of our own product is called for.

I understand that when I was here before that frozen beef and lambs from Australia and Argentina were selling in the markets of this city at about 6 or 7 cents less a pound than our own meat was selling. That is, the wholesale price was 6 or 7 cents lower than American meat, but the consumer did not benefit. That seemed to me to be criminal, when we had an overproduction—according to the statistics and according to the information we could get from every source—in this country; that our farmers out in the West in the section where they produce these vast herds of beef and mutton are having to compete against the importation of that frozen meat which came into this city and other cities along this seaboard, to deprive our people of the higher value which the meat would naturally fetch back there, because that is the history of business; the dealer would come back and say, "We have got to compete with the imported cheaper meat." And by reason of the duty being high—and as I stated before the Ways and Means Committee that I hope there would be an embargo placed against the importation of that meat, and that it would be kept out of this country.

Senator JONES. Does that trade promise to be a permanent condition?

Mr. MERCER. I do not know why it should not be. We can not produce in the United States, under our conditions of living and the kind of citizenship we have, in competition with Argentina and other South American countries, and if they are permitted to occupy our markets they will continue to ship to those markets.

Senator JONES. The thing that concerns a great many people is about this fact, that last year we exported 24,059,711 pounds of canned beef; we exported 9,749,148 of fresh beef; we exported 25,771,176 pounds of pickled or cured beef; and the year before, 1919, we exported a great deal more than that—I should judge pretty nearly twice as much as the previous year.

Mr. MERCER. I expect so.

Senator JONES. And we imported beef and veal in the months ending September of these years of beef something over 28,000,000 pounds and exported 2,037,000,000 pounds, in 1921 something over 13,000,000 pounds; and of mutton we imported in 19

,000,000 pounds plus, in 1920 49,000,000, in 1921 about 19,500,000 ounds. Of course the importations of pork products were very mall, but they amounted to something. Where does that beef and eal come from that is imported here?

Mr. MERCER. Of course I do not know without looking at the record, but I would say largely from Argentina and Brazil and South merican points, and of course the mutton in great quantity from lew Zealand and Australia.

Senator JONES. Those countries export a great deal of those products, do they not?

Mr. MERCER. I think so; yes, sir.

Senator JONES. They export a great deal to the same markets here we send our exports?

Mr. MERCER. I presume they do; I think the record shows that.

Senator JONES. Then how can that be a permanent situation reachig any considerable magnitude if we are exporting?

Mr. MERCER. It is just the general conditions of the country that re going on from year to year that naturally follow up one year fter another. I would say this, that if we prohibited by an embargo r even a high tariff the importations of the meats that you refer to, e would not have exported so much meat, because our people would ave consumed it at home, and we would probably have had a more ven keel on prices.

I am very strong for looking after our home people first.

Senator CURTIS. Reports, Senator Jones, say that 72 per cent of ur importations of beef were from Argentina.

Mr. MERCER. It must be mostly from down there.

Senator JONES. It came from Argentina and Canada?

Senator CURTIS. It came from Argentina and Canada.

Senator JONES. We are selling our meats abroad in competition ith those countries, and at the same time they are shipping some of eir meat in here. It looks like rather a strange situation, and if e could get at the reasons for it, I think it would be of value to us.

Mr. MERCER. I think Judge Cowan illustrated the reason—that e people who have the meat to export from Argentina are going export it to the best market they can find, and perhaps at the time ey exported it the United States was the best market they could nd. Newspaper reports from England this week say that there is glut in the market that would naturally result in diverting South merican beef to this country.

Senator JONES. The suggestion was made here by Judge Cowan at those importations into this market were made by the very ople who are exporting from this market to other countries.

Mr. MERCER. The record shows that that is largely true. The rge packers who are operating in the United States are operating Brazil and Argentina and Australia, and New Zealand, and, of urse, they are seeking the market where they can find it in any rt in the world, and have the same interests there in their business erations as here, I presume. I do not know just the percentage meat they export, but it is quite a percentage of the meat that exported from those countries by the same people who buy and anufacture the meat of our own country and export it and sell it re.

Senator JONES. If we put a tariff of 4 cents a pound on meat, you do not think that would raise the price to the consumer, but you do think that it would have the effect of keeping out of this market any of these importations?

Mr. MERCER. No; I do not think it would. I think there would be importations made to this country, because they would pay the duty and come when the market would warrant them in doing so. I believe this, Senator, and I feel it conscientiously, that within two years from now that unless there is a change in the conditions of the live-stock farmers of this country, we will have a tremendous and terrific scarcity. I do not know how it is possible, if the conditions continue as they are now, for our people to produce what our people want. We have got to change the situation some way, or else our stock raisers are going to quit—they are quitting.

Senator JONES. The thought has arisen that our exports of fresh beef were of the high grades of fresh beef, and that the frozen beef was coming into this country to supply a greater demand of cheaper beef.

Mr. MERCER. That applies in a measure, but not altogether. We have some as fine frozen meat imported into this country as we export from this country. The records will show that. But the larger portion of meat comes in here from foreign countries in competition with what we might class our lower-grade meats.

Senator JONES. I am inclined to believe that the majority of people will think that if you raise the price of the meat to the retailer that the retailer will consider that in fixing his sale price, and that that will result in the raising of the level of meat prices. But it is thought also that even if that should result that this country must do something of that sort in order to keep up its meat supply and not be dependent on other countries for the supply of meat.

Mr. MERCER. Of course, when we get to that, that can be considered. But I do not think that should be considered now. I think that the resources of this country are ample to the extent that we can produce all that we need and more provided we are protected, and that our people deserve the protection of its Government to the extent of prohibiting the importation of competitive products of their farms to destroy the value of their output.

Now, to answer partially your question, you take the prevailing prices that the consumers pay. You have in this country to consider the selling public as well as the producing public, and which I think has been done. To-day the consuming public is paying for the meat food of this country just a little percentage less than they paid when the producer was getting 100 per cent more for his product than he is getting to-day.

Then, if that be true, the importation of foreign meats in here has not any bearing upon cheapening our living at all.

Senator JONES. What remedy did your committee suggest for meeting this situation which you have just referred to?

Mr. MERCER. I do not think that they have come to any conclusions as to a remedy, only that we favor, of course, a reasonable tariff. That will relieve in two points: It will help to support the Government financially and it will help to protect in a way our home industries.

Senator JONES. I can see how the producer will get some relief 'om tariff on meats in stabilizing the market, and perhaps the ariff would not raise the price of meat very much even to the conimer. But it would stabilize the market. But there is that great tuation in which the consuming public is more interested—the ctreme spread between production costs and the consumers' cost.

Mr. MERCER. I understand our Department of Agriculture is iaking exhaustive investigations of that question now.

But to illustrate that point, less than a year ago, when it was noised nd heralded abroad all over this country that there were so many argoes of frozen lambs coming in here what happened to our sheep idustry? It dropped 40 or 50 per cent in value. I do not think ie consuming public ever got any benefit of the drop. They never id in our section of the country, although they might in the East.

Senator JONES. I doubt if they did in any section of the country.

Mr. MERCER. That is the situation we are all in. We are just slating to you our side of how we see it, and it is a condition that we now exists among us, and it has all come upon us so unfortunately 1 the last few years, that if any industry in this country, regardless f what the past might be, needs protection by its Government o-day it is agriculture. There is no question about that.

Senator JONES. I agree with you absolutely about that, Mr. lercer.

Mr. MERCER. And the question of values—the live stock alone ggregates two-thirds of our national debt in value.

Senator JONES. My thought is this: If you are to benefit your griculture with a tariff, the only way in which that benefit can be iade material would be in the price of the product to the producer, nd the thing that we should do is to raise that price to the producer o that he can produce at a reasonable profit, and then take some ther step to lower this price to the consumer, and do away with this xpensive spread between the producer and the consumer.

Mr. MERCER. I think that is sound, and I also think that you can ot make any mistake. We are a living people; we are moving long, and if Congress should make a mistake in putting too high a ariff on, another Congress could reduce the tariff.

I hope this Senate committee will put hides on the dutiable list, nd raise the tariff on some other agricultural products.

TATEMENT OF E. B. SPILLER, FORT WORTH, TEX., REPRESENTING THE TEXAS AND SOUTHWESTERN CATTLE RAISERS' ASSOCIATION.

The CHAIRMAN. Where do you reside?

Mr. SPILLER. Fort Worth, Tex. The membership of the Texas nd Southwestern Cattle Raisers' Association are producers of cattle n the States of Texas, Oklahoma, and parts of New Mexico, and Arizona, and some have ranches, of course, in Kansas, too.

It is so well known that it is needless for me to go into the condiion of the live-stock industry to-day. I was raised on a ranch and have been connected with this association for 20 years now, and I have never seen or known of such deplorable conditions as exist to-day. When you see it as I do, it is pitiable indeed. There are these men whom I have known all of my life and with whom I have

been associated; I know that they have struggled, men and their families, to build up and to make their living out of the ranch business. They did build it up, and they have a ranch on which the man and his family, as a rule, have been doing practically all of the work The market conditions have been such that they have suffered enormous losses. They, as a rule, are not people who apply to the Government or to anyone else for help as an individual. But conditions exist to-day so that it is impossible for them to continue in business unless some measure of relief is extended to them.

As to what benefit a tariff on cattle and hides would be to the live-stock producers, I see it in this way: We know that in Argentina Brazil, New Zealand, and other countries that produce live stock cattle and sheep, in very large quantities, the same people who handle the live-stock products of those countries are the big packers of this country. They can throw on our markets at any time they desire enough beef to demoralize our beef market, and they can throw upon our markets at any time they desire enough mutton to demoralize our mutton market. That is not speculation that is not what we believe—but it is what we have seen done time and again in the past. We ask for those people who are struggling to try to remain in the business, to rehabilitate the business, that they be given the benefit of a tariff that will take away the danger of having their market destroyed in that way. That is the plain statement of facts. That is all we ask for. We are not asking for any special favor or any protection. We are people who have been in this business and want to stay in it. We feel that we are an important industry, one that has a large part in the production of food for the American people.

When I think how these people are struggling to get along. I realize that probably few of you comprehend the conditions. We can tell you about it. There is not a man in the cattle business in our country that I know of who does not know what the foreign competition in dressed meat and hides will do to the markets. It has been done. Every one of them has felt the effect of it in the market, and they all want a tariff duty that will take away the danger of that thing.

That is the benefit of a tariff measure as we see it.

I can not go into details and give you any figures. They have all been filed here. But I would it were possible, gentlemen, to express my feelings and my views as well as the gentleman from Cornell University in regard to poultry. But this country is a country for Americans, for our producers. We are entitled to our home market. We produce a surplus now, and we certainly do not want to be the dumping ground for the surplus product in other countries by people who care nothing about our people, who pay none of our taxes and have no interest in us.

Senator JONES. Mr. Spiller, I would like you to give us, if you will, a little picture of how the free range has disappeared and how the cattlemen now own to a great extent their lands and grazing lands, and, if you think it is correct, how the breeding end of the industry has practically gotten on to a farm-cost basis of breeding, so far as the supply in this country is concerned.

Mr. SPILLER. Oh, yes, there is no free range, and the cost of production has increased on account of increased values of land

There a man has bought land, he has had to pay a high price for t in the last several years; the cost of leases has been higher; is taxes as he has gone along have become higher—everything he as bought has been increased in price.

The day of the free range has long gone by, and that condition hat existed many years ago that made the business very profitable—ll those conditions that existed in the early days that eliminated the xpenses are gone. The operation of a ranch now is a business roposition, with overhead expenses and other expenses, the same s any other business in the United States that requires good business ianagement to operate.

Senator LA FOLLETTE. Even under the very best of conditions?

Mr. SPILLER. Even under the very best of conditions.

Gentlemen, I am not a tariff expert or artist, but I state to you the ondition of the people I represent.

Senator LA FOLLETTE. If you know of any people in the world eeding help it is the cattle people?

Mr. SPILLER. I am just one of the cowboys. I want to make one ther statement. I am in the cattle-raising business in Texas. I ave been with them practically all of my life. They are very much iterested in this tariff proposition. Some might say, being so much iterested, why are they not here? The plain fact is that they do ot have funds available to come here.

Mr. COWAN. I would like to reserve the right to analyze some of iese statistics in a very short way that may be thought later on to e of some value to your committee. I do not know that I shall ave the time, but I should like to reserve that right.

The CHAIRMAN. If you prepare anything, the committee will be lad to consider it.

TATEMENT OF ISAAC T. PRYOR, SAN ANTONIO, TEX., REPRESENTING THE AMERICAN LIVE STOCK ASSOCIATION.

Mr. PRYOR. My full name is Isaac Thomas Pryor.

The CHAIRMAN. Where do you reside?

Mr. PRYOR. San Antonio, Tex.

The CHAIRMAN. Will you proceed to address yourself to the question of hides, which I understand you want to be heard on?

Mr. PRYOR. Well, my address is going to be on the subject of the ariff, and hides in particular, but beef hides and the products of attle.

I claim that to compete with foreign countries in the raising of attle, which is a branch of agricultural industry, that we must ave some degree of protection. I will hurry along by saying that i four countries I will give to you there are 41,000,000 people, and 1,000,000 cattle. In this country we have 106,000,000 people and 7,000,000 cattle. The salaries and the wages of those people in hose four countries—Argentina, Uruguay, Brazil, and Australia—re nothing like the salaries paid the people in this country for raising attle.

Senator SMOOT. Mr. Pryor, will you tell me, briefly, just what you ant, so that I can have it here to refer to quickly? What do you ant on cattle less than 2 years old?

Mr. PRYOR. Here is what I want: I respectfully submit for your areful consideration the following schedule of import duties, that in

my opinion will be necessary to stimulate the production of live stock in this country as well as place it on an equal footing with other countries.

Senator SMOOT. What is it?

Mr. PRYOR. That you enact a duty of 20 per cent ad valorem on all cattle and hides imported into this country. That you enact a 20 per cent ad valorem duty on all live stock imported into this country.

That a duty of 20 per cent ad valorem be placed on all fresh and prepared meats, subject, however, to a minimum of 4 cents a pound specific duty.

I can look you men right in the face and tell you that in Mexico we pay our helpers $15 a month in Mexican money, and they feed themselves. That would be $7.50 a month in our money. That is going on to-day.

On this side of the river in Texas we pay our cowboys $30 a month in Arizona and furnish them everything.

My son-in-law has recently leased 650,000 acres in what is known as one of the most beautiful countries on the face of the globe. This land lies in a valley 40 miles long and 10 or 15 miles wide, with mountains on both sides. He has leased it for 15 years, at what I have seen the tract. He leased it for 1½ cents an acre for the first five years, 3 cents an acre for the second five years, and 5 cents an acre for the third five years.

Senator SMOOT. That is in Mexico?

Mr. PRYOR. That is in Mexico; and that is parallel with conditions in those southern countries, as a rule, We are leasing our lands in our country all the way from 15 to 40 cents an acre.

I am interested in one property in Mexico, 170,000 acres, that we get $1,000 a year for; that land on this side of the river would lease for $40,000 or $50,000 a year. I am giving those figures so that you may understand why we need a tariff on cattle.

I have been in the cattle business for 52 years.

Senator MCLEAN. What is the matter with the Mexicans that they do not get more rent for their property?

Mr. PRYOR. There is nobody to buy their property but Americans and the reason we do not buy anything down there is fear of the stability of the Government.

Senator MCLEAN. I should think there would be competition among Americans that you could get pasture at that rate.

Mr. PRYOR. You would think so. I am now preparing to move 3,000 cows across the border into that country, in January.

As I told you, I have been in this cattle business 52 years. I have seen the cattle go up; I have watched the tariff under the Dingley and the Underwood bills. Gentlemen, it is my honest opinion that if it had not been for this World War the Underwood bill would have brought destruction to the cattle industry in this country.

The CHAIRMAN. And to every other industry.

Mr. PRYOR. It would have brought that, and the Democratic Party would have been put out of power on account of that. I know that for this reason, that immediately after the Underwood bill was passed I was importing a good many cattle from Mexico. I was paying the United States Government 20 per cent ad valorem. I would bring over 10,000 in a year. Immediately after the Underwood bill was

›assed we brought them in free, and the Mexican Government put 20 ›er cent on and they got the money and the United States did not.

And then the beef from South America began to come into this ountry in increasing quantities, and would have come in here in ufficient amount to have ruined us if it had not been for the war and he demand for beef in the war zone that diverted it from South merica over to Europe.

Immediately after the armistice was signed, what happened? hey began to load these ships in South America with beef and iutton for the United States, and they brought into this country in 919 and 1920 a sufficient quantity of mutton and beef which, when ut into carload lots, would make 13,000 carloads. I have worked it ut into car lots, and for this reason: I wanted to show the difference. 'ou take 10,000 cars of mutton and sheep from the various ranges all ver the United States and ship them to market. The railroad comanies get the freight. The shipper on the train and the stockyards nd every interest, besides what the farmers have used to produce his beef, get something out of it. When the check is given for the eef it goes back to some country bank or is paid on some hardressed cattleman's paper.

Compare that transaction to 13,000 carload lots of beef brought in om foreign countries. It slips into our country without ever spendig one dollar in this country. It gets unloaded in these ports, put ito the trade. Ninety or 95 per cent of it, I will say, has gone back › some foreign country.

I say to you, gentlemen, after 50 years' experience that this ›untry has never been touched, when it comes to producing cattle nd hogs and sheep, in the matter of capacity. We can take care of nd produce 100,000,000 cattle in the place of 67,000,000, if we have ie encouragement to do it. Every farm in the country ought to have ittle on it.

The greatest farming county in the United States is Lancaster ounty, Pa. What makes it the most fertile land and the best farms i the United States? They feed cattle every year in Lancaster ounty. They buy them in the markets and take them there and ed them. For what? To get the droppings and manure on their rms. If that was done in all the other counties and in all our nge country, we would produce 100,000,000 cattle; would feed the merican people with 75 per cent and probably take 25 per cent and iip it abroad.

That is better than to discourage us and make us cut down our oldings.

The markets of Fort Worth alone this year, which is only a State arket—it is not a big market like Kansas City and Chicago— iipped up to a month ago 145,000 more calves than they did last ear. Why? They are discouraged. No tariff has always dis›uraged them. They have other things that discourage them. I ill touch on that in a moment. I do not mean to lay all of the iscouragement to the low tariff, but the low tariff did start us downard. Cattle was the first to start on the downward tendency in this ›untry, and the imports of meat brought into this country is what id it. Then there was the stringency of the money market.

The CHAIRMAN. We are very glad to get this out of the way. If ›u want a tariff on hides, you are interested in hurrying us along?

Mr. PRYOR. That is right.

The CHAIRMAN. You have as much interest as we have in shortening the hearings.

Mr. PRYOR. Yes, sir. I am going to file this brief with you; it gives absolutely concrete reasons. May I read one paragraph of that brief?

The CHAIRMAN. Go ahead.

Mr. PRYOR (reading):

We have in the United States 20,000 millionaires, judging from the income tax records. This estimate is based on the assumption that each individual who pays taxes on an income of $50,000 or more is the owner of a million-dollar estate, and it is very probable this estimate is a conservative one.

More than 6,000 of these millionaires live in New York State and probably 90 per cent of the others live north of the Mason and Dixon line and east of the Mississippi River. How many of these men made their millions in farming? Whoever heard of an "honest-to-God" millionaire farmer? "No such animal." How did most of these millionaires make their money? The answer is, in the manufacturing business. Who furnished the raw material for their plants? The live-stock raiser furnished the cattle, sheep, and hogs from which they produce beef, mutton, and pork to feed the world. They furnish the hides and wool, which the manufacturer converts into leather and cloth to shoe and clothe the world. The farmer furnishes the cotton from which the manufacturer creates cloth to make clothing for the people. They also furnish the grain from which to create flour, meal, and cereals to feed the people.

That comes out of the ground; that is where the manufacturer gets it.

Here is exhibited the community of interest, one absolutely dependent upon the other, which should be a 50-50 proposition instead of—well, I can't even guess what per cent the farmers and ranchmen receive for their so-called raw material as compared with what the manufacturer receives for the finished product.

BRIEF OF ISAAC T. PRYOR, SAN ANTONIO, TEX., REPRESENTING AMERICAN NATIONAL LIVE STOCK ASSOCIATION AND TEXAS AND SOUTHWESTERN CATTLE RAISERS' ASSOCIATION.

The farm and ranch industry of this country is the very life and vitals of its existence. It should have a superior claim because its prosperity is the Nation's best protection.

By the very nature of this business it is more exposed to adverse influences and has much less protection against losses than any other business of similar importance.

Hence, the farmer and ranchman should have credit in larger proportion than has been extended him in the past. Increase their credit and they will increase their production, provided they receive fair treatment as to a tariff on their products.

The farming and live-stock interests are suffering from competition with raw material from foreign countries imported into this country free of duty; they can not compete with cheap labor employed to cultivate or raise stock on cheap land and maintain our standard of living and property values. If they are forced to do this, then poverty is their heritage. The farmers and the ranchmen are as much entitled to a tariff on the so-called raw material as the manufacturers are on their finished product.

Why should they be compelled by law to sell their products in a free market and buy in a protected one? It is an unjust discrimination.

The tariff affords a degree of protection and at the same time produces a revenue, thus reducing our tax burden just that much and the less taxes we pay the more we can lay aside for a rainy day.

We talk about a tariff of least a sufficient amount to equalize the cost of production here and abroad. Who knows or can find out the exact cost of production? Take the cattle business for example. It costs less to produce a beef in south Texas ready for slaughter than it does in north Texas. It costs less to produce a beef in Texas than in Nebraska, and less in Kansas than in Illinois. One year it can and does often cost 25 to 50 per cent more to care for an animal than the previous year, or the year following, hence the cost of production will vary all over the United States according to local conditions, etc.

We should, however, place a tariff sufficiently high on live stock and the products of live stock to cover the maximum cost of production, compared to that of foreign countries, plus a reasonable profit, and at the same time not so high as to create a monopoly in this particular branch of agriculture.

We should not ask for favors in any form but oppose favors in all forms. It is asking no favor to put us on an equal footing with foreign importers, and when we don't receive that consideration from Congress then the favor is extended the foreign producer of raw material and not the home producers, which is absolutely unfair.

To better understand the importance of protecting our live-stock producers by a proper tariff, the following statistics should be studied carefully:

Population, and number of cattle and sheep.

	Population.	Cattle.		Sheep and lambs.	
		Prewar period.	Recent estimates.	Prewar period.	Afterwar period.
[Arg]entina	8,284,000	25,867,000	35,000,000	81,485,000	8 ,000,000
[U]ruguay	1,379,000	8,193,000	7,802,000	26,286,000	11,473,000
[B]razil	26,542,000	30,705,000	37,500,000	10,653,000	7,000,000
[A]ustralia	4,971,000	11,745,000	11,040,000	92,047,000	91,676,000
Total	41,176,000	76,510,000	[1] 91,342,000	210,471,000	[2] 193,149,000
[U]nited States	106,653,000	61,804,000	[3] 67,866,000	52,448,000	[4] 39,863,000

[1] Increase, 19 per cent. [2] Decrease, 8 per cent. [3] Increase, 9 per cent. [4] Decrease, 4 per cent.

The four competitive countries mentioned are known to consume less meat per capita than our people and their population is less than 40 per cent of that of the United States, yet they raise nearly 40 per cent more beef and four times as much mutton as we do, and consequently export the bulk of their meat.

Argentina has more than 4 cattle and 10 head of sheep per capita, while we have but little more than half a beef per capita and less than half a mutton per capita. The meat markets of this country are in large cities, most of which can be reached by water transportation. In other words, at least one-third of the American people to-day can be reached from foreign countries by water transportation and when the great canal is built which will connect the lakes with the Atlantic Ocean, thus permitting ocean going ships to reach Chicago, one-half of the American people can be fed by water transportation from foreign countries.

COST OF ARGENTINE LABOR.

From the Pan American Union statistics it develops that farm laborers in Argentina receive from $10 to $20 per month and board, so it is plain that with our farm labor being paid from $30 to $40 per month and board, our labor cost of production must be more than two or three times as great as Argentina.

It should also be considered that these competitive countries still have enormous tracts of free range, and the cost of raising cattle is much less than here. Land values and pasture charges are much lower than in this country, and there is hardly an item of expense incident to the live-stock business that is not very much less in competitive countries than here.

Live-stock receipts at market centers declined more than 10 per cent in 1920, as compared to 1919. On such a decline in receipts why didn't cattle, hogs, and sheep increase in price? The answer is, imports of meats free of duty is various forms took up the slack and prevented the advance; on the contrary, pressed the market downward. Cattle led in the decline of agriculture products in 1919 and has been on the toboggan ever since. Each month live stock has dropped a little lower than the previous month; now 7 cents per pound live weight looks as good to us as did a 15-cent live weight in the spring of 1919.

Over 80,000,000 pounds of mutton and lamb was imported into this country in 1919 and 1920.

Putting the average mutton carcass at 40 pounds, it seems there were the equivalent of more than 2,000,000 sheep brought into this country free of duty during said period and of this number three-fourths arrived during the year 1920.

BEEF AND VEAL IMPORTS.

More than 100,000 carcasses of beef and veal were also imported into this country free of duty in 1919 and 1920, making a total of over 3,000 carloads of cattle and about 10,000 carloads of mutton and lambs. This vast amount of meat was brought into this country in ships which entered our harbors from the high seas without the expenditure of one single dollar in this country before it reached our large consuming centers. When sold, at least 95 per cent of the proceeds was returned to some foreign country—practically little or no benefit to our commerce in any way. This is the direct result of no duty.

What if this 3,000 cars of cattle and 10,000 cars of mutton and lambs had been marketed from our farms and ranches in this country? Our railroads would have received freight on 13,000 cars of cattle and sheep, the charges for switching and bedding the cars, feed, yardage, attendance, war tax, also a commission charge would have been distributed among the various interests named and finally, and most important, the net proceeds would have been deposited in our home banks or applied on some hard-pressed cattle or sheep man's paper. This would be the result of a protective duty on imports. Which do you want and which will do the most general good? It does not take a Solomon to answer this question.

Had it not been for the World War the Underwood bill would have wrought destruction to agriculture, also brought grief to the Democratic Party. Immediately after this Underwood bill was passed dressed or frozen beef and mutton began to be diverted from Europe to this country in large and increasing quantities. Only the war and the great demand for meat in the war zone gave us temporary relief from the imports from South America. Shortly after the armistice was signed these great foreign ocean-going vessels began loading—not only meats, but other agricultural products—in great and increasfng amounts. On January 5 of this year two ships reached the United States loaded with 270,262 carcasses of mutton, and three other foreign ships were en route to this country loaded with mutton. Five ships in one month containing about 675,655 carcasses, or 34,687,580 pounds of meat, coming in free of duty is a staggering blow to the meat producers of the United States.

NO MILLIONAIRE FARMER.

We have in the United States 20,000 millionaires, judging from the income-tax records. This estimate is based on the assumption that each individual who pays taxes on an income of $50,000 or more is the owner of a million-dollar estate, and it is very probable this estimate is a conservative one.

More than 6,000 of these millionaires live in New York State, and probably 90 per cent of the others live north of Mason and Dixon's line and east of the Mississippi River. How many of these men made their millions in farming? Whoever heard of an "honest-to-God" millionaire farmer? "No such animal." How did most of these millionaires make their money? The answer is, in the manufacturing business. Who furnished the raw material for their plants? The live-stock raiser furnishes the cattle, sheep, and hogs from which they produce beef, mutton, and pork to feed the world. They furnish the hides and wool, which the manufacturer converts into leather and cloth to shoe and clothe the world. The farmer furnishes the cotton from which the manufacturer creates cloth to make clothing for the people. They also furinsh the grain from which to create flour, meal, and cereals to feed the people.

Here is exhibited a community of interests, one absolutely dependent upon the other, which should be a 50–50 proposition, instead of—well, I can't even guess what per cent the farmers and ranchmen receive for their so-called raw material as compared with what the manufacturer receives for the finished product.

I respectfully submit for your careful consideration the following schedule of import duties that in my opinion will be necessary to stimulate the production of live stock in this country as well as place it on an equal footing with Mexico and Central and South America.

First. That you exact a 20 per cent ad valorem duty on all cattle hides imported into this country.

Second. That you collect a 20 per cent ad valorem duty on all live stock imported into this country.

Third. That a duty of 20 per cent be placed on all fresh and prepared meats brought into this country, subject, however, to a minimum of 4 cents a pound.

FROZEN MEATS.

[Paragraphs 701 and 702.]

TATEMENT OF GEORGE W. ARMSTRONG, FORT WORTH, TEX., REPRESENTING THE CATTLE RAISING INDUSTRY.

The CHAIRMAN. Where do you reside, Mr. Armstrong?

Mr. ARMSTRONG. Fort Worth, Tex.

The CHAIRMAN. What is your occupation?

Mr. ARMSTRONG. Cattleman, cattle raiser, and manufacturer.

The CHAIRMAN. Manufacturer of what?

Mr. ARMSTRONG. Iron and steel and oil and oil-well supplies.

The CHAIRMAN. Will you state to the committee what you have to y upon the subject of cattle raising and the importation of cattle, suggested by Senator Gooding?

Mr. ARMSTRONG. Gentlemen, I understand you have had this frozen eat and live-stock importation question covered, and that I am tak-g up some one else's time. I therefore will only call attention to one hase of this matter that perhaps has not been presented to you—I n a cattleman; have been engaged in the business for 10 years, and every branch of the business. I have been largely a breeder of ttle, but I have also fattened cattle of all kinds—baby beef, full-fed ttle on corn, on cake, and on the grass.

I am not going into the question of costs, unless the committee de-res it, because that perhaps has been covered by others and your me is very much occupied.

In 1915, I think it was, or 1916, I made a trip with Dr. Ladson, of he Bureau of Animal Industry, of the Department of Agriculture, nd Mr. Uribe, connected with the Colombian legation, through olombia for the purpose of investigating range conditions and the attle industry of Colombia. The Government was making the in-estigation there for the purpose of determining whether or not those attle would be admitted into this country. They were looking pecially into the question of the foot-and-mouth disease. The olombian Government claimed that they had no such disease in hat country, and that their cattle should be admitted into the United tates.

I went there for the purpose of determining whether or not they ould be admitted, and if they were I wanted to open up a ranch in hat country, because lands had gotten so high and feed so high and he cattle industry had become unprofitable, so that I was at the time onsidering the matter of either going out of the cattle business or etting into a country where lands were cheaper and conditions etter. Dr. Melvin, who was the Chief of the Bureau of Animal ndustry, kindly consented that I should go with this delegation.

I found the greatest cattle country that I have ever seen. I doubt f the Argentine will compare with it. I have never seen that coun-ry, but certainly we have nothing in America to compare with it.

We went up the Sinu Valley, and then we went across on horse-back. I spent two months in the country, and I visited a number of the ranches except on the Pacific coast. I did not go across to the Pacific coast. We got as far as Bogota, and turned back.

Senator WATSON. Are they now shipping cattle into this country from Colombia?

Mr. ARMSTRONG. I think not. I do not think they will be permitted to ship cattle into this country, if you will allow me to say, Senator, because they have a disease, called surra, or rinderpest, which is fatal to horses, but can be transmitted through cattle. It does not seem to injure the cattle; they have it in a latent form. But through the cattle it can be transmitted by the fly to horses, and there is no recovery from the disease. When a horse takes it, death follows. There are no horses in that country, practically speaking, because of the disease of surra. They have had ravages of it in the different sections of the world; practically all of the horses becoming infected with it die. Dr. Ladson found that disease——

Senator LA FOLLETTE (interposing). You say it is carried by a fly?

Mr. ARMSTRONG. By a fly; yes, sir. It is a disease of the blood, and it separates the corpuscles of the blood—the white corpuscles form a bag under the stomach of the horse and he is feverish. But they usually kill them when they take the disease; they had as well kill them.

I did not buy in the country because of two things. They were expecting the building of three packing plants—Armour, Swift, and Morris—and claimed that they had promises of those plants, and that the building was suspended during the war. There was some uncertainty about it, and Dr. Ladson told me that the cattle would not be admitted into this country.

What I want to impress upon you is the fact that in that country they do not feed cattle at all; they have this para grass that grows 6 or 7 feet high. It is fattening; cattle stay fat on it the year around; it is also green the year around. One acre of it will fatten, they claim, from three to five head of cattle. That grass grows in the valleys, it grows—if you have ever seen Johnson grass——

Senator CURTIS (interposing). It grows, also, as high as 3,000 feet above the level of the sea.

Mr. ARMSTRONG. As high as 3,000 feet?

Senator CURTIS. Yes.

Mr. ARMSTRONG. It would be so high that in traveling through the country on horseback you could not see the cattle until you got within 10 or 15 feet of them, it was so thick and high; and the cattle were as fat as they could be.

Senator WATSON. Is the beef from that country admitted to European ports?

Mr. ARMSTRONG. At that time they had no packing plants.

Senator WATSON. Have they packing plants now?

Mr. ARMSTRONG. I am not posted about that. But they must have, because they claim to have from 5,000,000 to 20,000,000 head of cattle down there. I am suré they have as many as 5,000,000 head. The estimate has been made that Colombia has from 5,000,000 to 20,000,000 head, but they do not know how many they have. In the country between Venezuela and Colombia there is a vast plains country where they have a great many wild cattle, and how many they do not know, of course, as they are uncounted. The cattle are very cheap there, as they are very cheap here now; but they were cheaper there than they are here at this time.

They can raise beef there, I estimate, at 2 or 3 cents a pound. In his country beef can not be produced any more at less than 7 cents ı pound; and prime beef can not be produced at less than 10 cents a ound. I doubt if it can be produced at 7 cents in any section of his country.

Senator McCumber. You mean on the hoof?

Mr. Armstrong. Yes, sir. It may be that it can be done in south-'est Texas under favorable conditions—but that is a country where hey have devastating droughts that wiped them out of existence once ı awhile. When they have a good year they can produce beef ery cheap, because they do not have to feed and they get the early arkets, and their wintering cost is very light.

Gentlemen, I would be glad to talk to you longer, but I realize I m trespassing on your time.

Senator Smoot. Why did you not invest down there?

Mr. Armstrong. I did not invest for the reason that there was ot a market for the cattle.

Senator Smoot. That was not the reason that Mr. Knight did not vest, because he made the same kind of an investigation you made.

Mr. Armstrong. Who was that?

Senator Smoot. Ramond Knight. I happened to be interested ightly in a cattle company that he was manager of, and he made at same examination. He decided not to go into the cattle busi-ss in Colombia on account of the diseases the cattle were suffering om there. He makes the same kind of a report that you do, but also says that he did not want to take the venture because of e fact that the cattle were affected down there in many ways.

Senator La Follette. Not from the fly?

Senator Smoot. No. The death rate among cattle was exceedingly gh, and he did not feel that he wanted to take the chance.

Mr. Armstrong. That was not true of the country I visited. the country I visited the cattle had bigger calf crops than we ve here, and their cattle were fat from the calf on.

Senator La Follette. What year were you there?

Mr. Armstrong. I was on my way there when the *Lusitania* was nk, which I think was in 1915 or 1916.

Senator Smoot. It was in 1915?

Mr. Armstrong. It was that year that I was there.

Senator Smoot. Mr. Knight made the examination in 1913, and that time he decided that it would not pay him, and he went to nada.

Mr. Armstrong. He may have gone over territory that I did not it. My tour was confined largely to the Sinu and the Magdalena vers. I went to Cartagena and went up the Sinu, and then rode horseback across to the Magdalena and came back from Barran-illa, a port that is near the mouth of the Magdalena River; and the ly reason I did not invest down there—the land was cheap—but ad no market for the cattle except the mines. The people there eat beef, and beef was very cheap, but they were producing all beef they needed.

Senator Smoot. What took Mr. Knight there was that he had n many of the Colombia cattle on the English market; in fact shipped cargoes of cattle to England and saw the beef from

Colombia there, and that is what took him to Colombia. As I say, he refused to go into the cattle business there.

Senator La Follette, I understood you to say, Mr. Armstrong, that you did not anticipate that there would be any importations of cattle from Colombia?

Mr. Armstrong. Not of cattle, but there will be of beef, Senator, because the packers now have, I expect, as much packing-house capacity in South America as they have in North America—the "Big Five" packers—and they will go where the cattle are. They may not be there, but there are enough cattle there now to justify the building of a packing house, and certainly the conditions ar such that they can be greatly increased. They can produce instea of 5,000,000—if they have 5,000,000 cattle there now, and I am sure they have—I think the country can produce 50,000,000 cattle.

Senator McCumber. You think, then, the character of the diseas from which practically all the cattle are suffering will not be such to prohibit the importation of the meat?

Mr. Armstrong. It will not. The disease is not in the meat; it a true blood disease.

Senator McCumber. If it is in the blood I can not see why it is no in the meat.

Mr. Armstrong. I am not posted about those matters, except th my information was altogether from Dr. Ladson, and he said th meat could be very safely shipped into this country, and he was th representative of the Department of Agriculture.

Senator La Follette. This disease, as I understand you, does n affect cattle?

Mr. Armstrong. It is in the cattle, but in a latent form; it c be transmitted from cattle to horses, but it does not seem to hurt t cattle.

Senator La Follette. It is transmitted by infection of the fly?

Mr. Armstrong. It is transmitted by the fly; yes, sir.

Senator La Follette. But it is not communicable by contact herding them together or anything of the sort, excepting as the conveys it, as I understood you?

Mr. Armstrong. I should think the blood when it is dead wou kill the disease; that it would take the life blood of the fly; and should think there would be a limit to the life of the germ that is the blood.

At any rate, I inquired into that feature of it, because I conside buying a place and just waiting until the plants were establish Land was cheap and I wanted to get a cheap country in which raise cattle, and I would not have considered that for a mom except that they assured me that the meat could be safely expor and that these plants were going to be located there when the was over. I seriously thought of buying a ranch; in fact, I made offer on one ranch there, which was not accepted.

This land will support three or four cattle, as it is well set w grass and is worth about $5 an acre; that is, the valley land; the land is worth anywhere from 10 cents an acre up to $1.

Are there any questions any of you gentlemen desire to ask?

The Chairman. Is that all?

Mr. Armstrong. That is all I care to say.

The CHAIRMAN. Senator Townsend, do you have some one to resent——

Senator SIMMONS (interposing). Mr. Armstrong, I have some vague ecollection—and it is vague, I admit—that when we were considerng the emergency tariff act some witness stated, either to me personlly or to the committee, I have forgotten which, that this South merican meat did not go well on this market, and that the packers ad had some difficulty in disposing of it in the United States. Do ou know anything about that?

Mr. ARMSTRONG. I am not posted about that, Senator; I do not now. I see no reason why it should not. The truth is there is not ny difference, so far as I know, between fat beef, no matter whether is made from corn, cake, or grass. The packers do make a differnce in the price, but they do that for the purpose of encouraging the eding of cattle. So far as the quality of the beef is concerned, asuming it to be fat, and assuming it is the same grade and kind of ttle, I do not think there is any difference. Of course, there is a fference between fat beef and lean beef, but I do not think there any grade of fat beef so far as quality is concerned.

Senator SIMMONS. The packers are, I suppose, for preserving the eat on the water from there here?

Mr. ARMSTRONG. I am sure that they have boats for that purpose, though I am not very well posted about that.

The CHAIRMAN. You have no definite suggestion to make on the riff?

Mr. ARMSTRONG. Well—yes, sir. I have just this suggestion, Senor Penrose, that the tariff cover all of the products of the steer—at it cover beef, hides, as well as the live steer—because there is no otection unless you do; of course, there is some protection if you ve out the hide. There is absolutely no protection if you leave t frozen meats. It is far better to have a tariff on frozen meat than is on the live cattle, because the competition largely will come m frozen meat, and for another reason, gentlemen, the packers ve not been exactly pleased with the attitude of the breeders—and am not unfriendly to the packers, either; I make this statement cause it is true. The breeders have been more or less antagonistic; ere has been more or less fighting on the part of the breeders, and, course, the packers have fought back, and the breeders are absoluely at the mercy of the packers. The packers can put the market and down whenever it suits them. They can kill beef in South nerica and bring it in here and manipulate the market to suit their rposes. If we are not "good" as they think we ought to be, they n say, "Well, now, we will just bring in a lot of beef from South nerica and keep this market down, and we will see if we can not eze a lot of these people who are not the right sort and let a new op' come on that may have a little sense."

The packers are no worse than the average men. I do not want make any other impression on you at all. Perhaps a lot of the ilt is on the part of the breeders; I think a great deal of it is misderstanding on the part of both the breeders and the packers, and breeders are not without fault. But they have the power and have not; and they having the plants in South America and havthe power to manipulate this market by bringing beef in here

whenever it suits them or taking it somewhere else, we are at their mercy, and that is too much power for one set of men to have over the destiny of another. And if we do not have this—though this alone will not do it—the tariff is not going to restore the cattle industry, because it has been too badly hurt—I think I will go out of the business. I intended to go out before the war or go to some other country. But the war came on, and I thought prices would go up and then the Government said it took food to win the war; and while I had been running about 6,000 or 7,000 head of cattle, I increased my herd to 10,000, though I have cut it down now to 2,000, and unless I can see more in it than I now see I am going out of the business. I have lost nearly $600,000 in it. I have lost money every year during the last 10 years except 2, and only made money 1 year, and think that I have given it the right sort of thought. I think I have operated the business as it should be. I am able to make money in other lines of business, but it is not in the cattle business. It is an impossible business under the existing conditions. The cattlemen are broke. I think the Government is going to have to go further than the tariff. There is going to have to be something done that has not been done yet or the cattle industry is a thing of the past.

Gentlemen, I am a convert on this tariff question. I have been a Democrat all my life—a Democrat believing in tariff for revenue only. But this war opened my eyes to the importance of protecting the basic interests of the country. I am for protection not for the cattle business alone, but for every basic industry in this country, because I think the country ought to be self-contained if it is to be strong in war and in peace, a prosperous country, and a country which can endure; that it is better to have a self-contained country and protect these basic industries than to build navies or maintain armies. If Germany had been that character of country, there might have been another tale. It would be a national calamity to let this industry that is suffering as it is now be stifled—and it is going that route at a much faster rate than you gentlemen think; disaster is sure to result. In the Fort Worth market this year—I know I am transgressing, and I am saying more than I ought to say—but I just want to mention this fact—we have had three calf-killing years on the Fort Worth market. I have not seen the daily publication—

Senator La Follette (interposing). Just what do you mean by that?

Mr. Armstrong. I mean by that that owing to drought, financial conditions, and other things the calves have been slaughtered. This year has been the worst of all. I am just mentioning the Fort Worth market because I see those statistics published in the papers every day, and I might give them as of a month ago, and I can not give them exactly, but approximately; and the last time I saw the statistics there had been 400,000 cattle marketed there of all grades except calves—that means cows, yearlings, and steers, everything except calves. But there had been 300,000 calves. Of the 400,000 cattle that were marketed that were not calves, part of them just went through the market to outside buyers. But the 300,000 calves all went to slaughter, and that is 100,000 more than last year, which was also a calf-killing year.

In two years' time, gentlemen, you are going to have to import beef, and you are going to have to pay the price for it. This country will never be an exporter of beef again; it is only exported to-day because the buying power of the people is limited, because of the financial situation. But we will not export beef any more after things become normal, and we are going to have to import a great deal of it, and it s not coming to the consumer any cheaper.

If you destroy the cattle industry in this country you are at the nercy of the foreigner, and eventually the consumer will pay the price. He may get a little temporary relief, but it will not be permaent.

Gentlemen, I want to record myself—I have done it publicly in ny home State—before you as for a protective tariff, not only raw materials, but on finished products and for every basic industry.

Senator SIMMONS. Mr. Armstrong, if I understand you, you mean o say to the committee that in your judgment the price of beef in his country is fixed by the packers?

Mr. ARMSTRONG. Absolutely.

Senator SIMMONS. And the price of live stock is fixed by the ackers?

Mr. ARMSTRONG. Let me qualify that: The price of beef is not holly fixed by the packers, gentlemen. In my opinion the packers hould be required to do the retailing. The price of beef is fixed to a ery large extent by the retailers.

Senator SIMMONS. I am not talking of what it ought to be, but I n talking of what it is.

Mr. ARMSTRONG. The finished beef price is largely fixed by the tailer. The retailer is undoubtedly doing more profiteering.

Senator SIMMONS. The packer can practically pay what he pleases r live stock, and he sells the manufactured product.

Mr. ARMSTRONG. He sells it wholesale; yes, sir.

Senator SIMMONS. Would that situation that you have referred be changed if we should build a wall around this country and not rmit any beef to come in at all?

Mr. ARMSTRONG. Not entirely; that would be only a step in that rection.

Senator SIMMONS. If that be true, do you not think the packers ve an absolute monopoly of the business here, and that it might nd to break that monopoly if you would let them have some little mpetition from the outside?

Mr. ARMSTRONG. There is not any competition——

Senator SIMMONS (interposing). It is not a question to my mind, e way you put it, of competition between the outside and the procer of live stock in this country, but it is a question of competition m the outside with the packers. Would you want to turn the rket over to them?

Senator LA FOLLETTE. The packer is the outside competitor, is not?

Mr. ARMSTRONG. I was going to say there is not any competition m the outside.

Senator SIMMONS. If it is true that the packers own all the meat the world, there can not be any. But do they?

Mr. ARMSTRONG. They do not own the meat, but the packers of the world——

Senator SIMMONS. Do they own it all?

Mr. ARMSTRONG. I do not mean to say they own it all; they do not own it all in this country, but they more nearly predominate in other countries, and especially the South American countries, than here.

Senator SIMMONS. Then, if the packers have a monopoly here, and if the packers at the same time have a monopoly in all the other countries of the world which grow stock, by reason of the fact that they own the packing plants there, what good can the tariff do in a situation of that sort?

Mr. ARMSTRONG. We have a limited supply of beef. The tariff can preserve this market here for the American people. I think you are going to have regulation of the packers, and do not understand me to say before this committee that a tariff would give all the relief the cattlemen need. They require financial help also.

Senator SIMMONS. Would not this be the operation of that? They have a monopoly here. If they have to bring it in from abroad and pay a little tax for bringing it in from abroad, he can simply add that tax to what he brings in from abroad to what he sells here without increasing the price one particle for the stock?

Mr. ARMSTRONG. That would be the effect; yes, sir. Of course if the packer must pay the tax when it comes in here, he is paying that much to the Government?

Senator SIMMONS. Yes.

Mr. ARMSTRONG. And if it does not affect the price, the Government gets the tax. If you can protect us against the fellow who is producing cheaper, the man who is making his beef at 3 cents, if you can make it cost more laid down here, the tendency is to put the price up here. The packer is not going to indulge in the foolish thing of paying taxes always, you know, because it costs him money, and he is going to fight with some discretion.

I do not pretend for a moment, gentlemen, to say that the tariff is going to solve this question. I am here to say to you that the cattleman needs this protection and he needs more than this protection. This is but a step and the only one that is now being considered. If you do not want this industry to perish you have got to regulate the packer—and I am in favor of regulating the industry and not in favor of Government ownership—you have either got to inquire into the cost and provide some methods of giving us a living price or you have got to valorize the industry as they do in Brazil and other countries, and as advocated by Secretary Meredith or——

Senator SIMMONS (interposing). I agree with you entirely looking at the subject from the standpoint of revenues. The packers, if they control this market, can control all the markets of the world. If you put a tax on them, of course, they would have to pay a certain amount of money into the Public Treasury and the people would have to pay that much more for their beef. But, I did not understand that you were presenting it from the standpoint of revenue. I thought you were presenting it from the standpoint of protection of that industry. Now, if you are going to present it from the standpoint of revenue, I should think that the last thing possible that

ught to impose a tax on for revenues would be a thing that is niversally consumed as a food product by the people. So, I would ot be disposed sympathetically to look at it from the standpoint f revenue.

I want to get just a little detailed information: Will you name the ountries from which beef is imported into this country?

Mr. ARMSTRONG. I think the larger volume of beef comes from e Argentine.

Senator SIMMONS. The packers, you say, control the situation ere?

Mr. ARMSTRONG. The packers have the principal plants there.

Senator SIMMONS. I am just trying to find out how powerful the ackers are.

Mr. ARMSTRONG. Well, my information is, Senator, that the three g packers have 20 or 21 plants in South America. My information mes from a packing house official. If that is true——

Senator SIMMONS (interposing). And that gives them control of e beef markets——

Mr. ARMSTRONG (interposing). And there are no other plants of nsequence in South America?

Senator SIMMONS. Go now to the next country.

Mr. ARMSTRONG. And that gives control to them of the frozen ef industry of that country.

Senator SIMMONS. Go to the next.

Mr. ARMSTRONG. I do not pretend to be well informed on these bjects, but I know the packers have plants in Australia and New aland. There is not a meat-producing country in the world that oduces a large amount of meat that I dare say that the packers ve not plants.

Senator SIMMONS. Then, in that situation, in your judgment, the ckers are in no danger from competition from the outside?

Mr. ARMSTRONG. They compete with themselves alone.

Senator SIMMONS. And they control this market absolutely?

Mr. ARMSTRONG. Yes, sir.

Senator SIMMONS. And every other market?

Mr. ARMSTRONG. Yes, sir.

Senator SIMMONS. Did you refer to the American packers when u say they have plants all over the world?

Mr. ARMSTRONG. I am speaking of the American packers. Gentle-n, let me say this again, that I am not unfriendly to the packers. ey are my personal friends. I have been associated with them, d they do not regard me as unfriendly. But they have got too ich power, and that power ought to be curtailed, and this is but a p in that direction.

Senator SMOOT. Mr. Armstrong, you have touched upon the ques-n in the proper place, when you said that as far as the consumer is ncerned the retailer is the man who charges the exorbitant prices.

Mr. ARMSTRONG. That is my understanding. My understanding this time is that the packers' wholesale prices are now reasonable; t the retailer is the man who is doing the profiteering.

Senator SMOOT. When the packers were paying $9 to $10 for lamb, d now they are paying $2 or $3, lamb chops are just as high to-day the consumer as they were at that time.

Mr. ARMSTRONG. We have got too many retail establishments. The packer has his cold-storage plants, and it seems to me to be in the interest of economy that he do the retailing, and that he should be regulated, and that he should be allowed a reasonable profit for his service, and that the producer be allowed to receive a reasonable profit, and I think that that is really the final solution of the problem.

Senator McCUMBER. Would you put all of the little butcher shops in the little villages all over the country out of business and put that business into the hands of the packers?

Mr. ARMSTRONG. I think you would get better service if you did that; you would get better meat and get it in the long run at a more reasonable price.

Senator McCUMBER. What would you have him do as a business—send him into the stock raising, then?

Mr. ARMSTRONG. Of course, it might be best for him to do the stock raising, too. But he would not want to go that far, and you could not get him that far. But the packer has the instrumentality for handling the beef from the hoof to the consumer.

Senator McCUMBER. That is true of every great monopoly in the United States. If they could be the producer and the retailer, too, the American public could have its meat cheaper, so far as profits are concerned. But what would the balance of the American people be doing if they allow a few monopolies to be the entire producers; and if it would apply to the meat business, would it not apply to every other character of business?

Mr. ARMSTRONG. We have got the monopolies, and we have been trying to break up monopolies here for a number of years ineffectually. We had just as well recognize the fact that they are here and regulate them. We are not going to break them up.

Senator WATSON. Mr. Chairman, I do not desire to interrupt the witness, but while this is very interesting I am reminded that we are here to make a tariff bill.

Senator SIMMONS. You can no more regulate the retailers than you can the packers.

Senator LA FOLLETTE. Just a moment. You stated that so far as the wholesale price is concerned that the packer is charging reasonably?

Mr. ARMSTRONG. That is my understanding; yes, sir.

Senator LA FOLLETTE. But at the present the price that he pays the producer of beef is not unreasonable, is it?

Mr. ARMSTRONG. It is about 50 per cent of the cost of production.

Senator LA FOLLETTE. At the present time?

Mr. ARMSTRONG. Yes, sir.

Senator LA FOLLETTE. At the present time he is taking his excessive profit out of the producer of beef instead of taking it out of his wholesale price to the public?

Mr. ARMSTRONG. I doubt very much if he is making an excessive profit.

Senator SIMMONS. He is taking his excessive profit out of the producer and giving the retailer an opportunity to get his excessive profit in another way?

Senator LA FOLLETTE. Yes.

TALLOW.

[Paragraph 701.]

ATEMENT OF FLOYD M. BARNES, CINCINNATI, OHIO, REPRESENTING LAUNDRY SOAP MANUFACTURERS OF THE UNITED STATES.

Mr. BARNES. My address is Cincinnati, instead of Washington, C., as printed in the schedule. I am connected with the Procter & mble Co., of Cincinnati, Ohio, and represent the Soap Makers' sociation on tariff questions. I am speaking more particularly to ragraph 701, namely, tallow.

Tallow represents one of the principal basic raw materials of soap, d to-day is approximately 25 per cent of our raw materials. We e asking that tallow remain on the free list.

About 75 or 80 per cent of the laundry soap sold in the United ates are tallow soaps. These soaps divide into two natural groups—ite laundry soaps and yellow laundry soaps, which are so-called zin soaps.

In 1913 the price of white laundry soap was 6.4 cents per pound. put it on a pound basis, for the reason that the bars vary in size. e peak of the high prices carried this soap to a price of 12⅛ cents r pound. To-day that soap is selling at 7½ cents per pound.

Yellow laundry soap which in 1913 sold at 5½ cents per pound, d at the peak of prices was selling at 10 cents per pound, to-day selling at 6 cents per pound. The difference between the 1913 and e 1920 prices represent to a very large extent the increased cost of ansportation of raw materials; the balance represents higher costs raw materials and higher labor costs. The soap makers of this untry have been bending their efforts in recent months toward tting the price of soap down to the price unit which is popular with e public at large, and that is a 5-cent bar of soap.

We find in this proposed tariff, however, that all of our principal w materials, such as oils and fats, are being put on a dutiable basis, hereas they have always been duty free. Tallow and oils represent least 50 per cent of our raw materials. This means, as we explained a previous hearing, that we are facing an advance in the price of ap which will approximate 15 to 20 per cent of the present selling ice. It means also that the duty which is being assessed on tallow d other commodities in which we are interested will not be a revenue producer. Take, for example, the matter of tallow. We have ways exported more tallow than we have imported, with a possible ception of the two war years when tallow came into the United tates freely from New Zealand and Australia, principally due to a sirable shipping condition which prevented the tallow from going o England. It will, therefore, not be a revenue producer, because he importation is practically prohibited.

It is not going to benefit the cattle grower. Only about one-third f the tallow in the United States is produced in packing houses from he killing of the stock. The other two thirds is produced from the endered stock, the so-called butcher's scrap, and restaurant scraps which is collected by renderers all over the United States, and the allow rendered out of it. So that as far as helping the cattle grower, t means nothing, for the simple reason that an average steer will

produce only from 7 to 9 pounds of inedible tallow, which at a half cent a pound means a matter of 3½ cents. It is entirely too small to be passed back to the man who is raising the cattle.

Senator WATSON. What was your statement made about the relative quantity of imports and exports of tallow?

Mr. BARNES. I said that the exports of tallow have always exceeded the imports, with the exception of two years.

Senator WATSON. What two years were those?

Mr. BARNES. From 1918 to 1919.

Senator SMOOT. Those are calendar years?

Mr. BARNES. Those were calendar years; yes, sir. The reason for that is this: It is simply a trading proposition. There are times when the tallow producers and renderers of this country have a better market in Europe, and they take advantage of it, and rightly so. There are other times when the price of tallow in South America or in other countries is on a buying basis, so far as the United States is concerned, and at those times the soap makers take advantage of those market conditions, and it is for that reason we have an exportation of tallow, and that we also have an importation of tallow.

Senator WALSH. Is the rendering business in the hands of a few people in the country?

Mr. BARNES. It is pretty largely controlled by the Chicago packers.

Senator WALSH. And they have agents all over the country to visit the butcher markets?

Mr. BARNES. Yes, sir. They collect the scraps from the butcher shops and restaurants.

Senator WALSH. And have it shipped to a central point?

Mr. BARNES. And have it shipped to central rendering points. It is a very large business, as far as those concerns are concerned.

Senator WALSH. They are not owned directly by the packers but by subsidiary corporations?

Mr. BARNES. They are all subsidiary corporations. The soap manufacturer is in the unfortunate condition to-day under the tariff program of practically losing all of his principal raw material and all of the work we have done for the last 30 years in the development of our supply of raw materials in these far countries is absolutely being torn down.

Senator WATSON. Did you use tallow in the manufacture of soap during the operation of the Payne-Aldrich Act?

Mr. BARNES. There was practically no tallow came in. We used what we could buy in this country.

Senator WATSON. The tariff was just the same as here provided, half cent a pound?

Mr. BARNES. There was no tallow came in, except in small quantities; the duty was prohibitive; as a matter of fact, I think the revenue averaged only about $3,500 a year under that tariff. So that was practically nothing.

In our hearing before the Ways and Means Committee of the House we unfortunately came in at the very end of the day, and were only given a very few minutes. Our briefs were filed, and the subcommittee that gave careful consideration to these briefs on oils and fats recommended to the full committee that they remain on the free list. But they were overruled, as the bill indicates, and we are asking that as far as the soap trade is concerned, our raw materials be left on the

ame basis as they have practically always been, and that is on the ree list.

Senator WATSON. The imports of tallow for 1921 were 1,762,000 ounds. Did that all go into the manufacture of soap?

Mr. BARNES. I would say that practically all of the tallow that is nported is nonedible tallow and therefore used for soap.

Senator WATSON. Suppose that we excluded it absolutely; would hat interfere with the manufacture of your soap? Have you not ther raw materials?

Mr. BARNES. There is nothing going to interfere, Senator, with the ianufacture of soap. We are going to manufacture soap just the ame as we have always done, but the consumer is going to pay more or it.

Senator McCUMBER. What proportion of a pound of laundry soap represented in the tallow?

Mr. BARNES. Tallow represents 25 per cent of all the raw materials iat go into soap.

Senator McCUMBER. That would be one-fourth pound. If you dded the tariff it would be a quarter of a cent added to a pound of oap that would be charged to the consumer.

Mr. BARNES. Correct; yes, sir.

Senator SMOOT. What other fats do you put into soap besides illow?

Mr. BARNES. All of the vegetable and fish oils. There is an exnsive development in this country of the hydrogenation of fats, icluding soya-bean oil and coconut oil; but they are all in this tariff roposition, so that the soap maker is in a very unfortunate position.

Senator McCUMBER. If the tallow would add a penny to every pounds of laundry soap——

Mr. BARNES (interposing). It is more than that, Senator.

Senator McCUMBER. At 1 cent a pound?

Mr. BARNES. You have no small units of currency in this country, nd when you have a price of 5¼ cents means that the soap is going be sold on the next largest unit.

Senator McCUMBER. I assume, however, that the manufacturer ills, of course, to the wholesaler, and therefore where he does that e does take into consideration quarters of a cent a pound?

Mr. BARNES. He may take it into consideration, but his profit is ased on that, and the retailer's profit is based on that. It is a umulative proposition, and when the retailer gets it, if the price is ¼ cents, he can not sell soap at 5½ cents, unless there was some istomer willing to buy 10 bars of soap, and he gets a unit price.

Senator McCUMBER. That is the retailer?

Mr. BARNES. Yes; but the average consumer can not buy 10 bars f soap at one time; he is in no position to pay it. Therefore, when e gets down to the smaller unit of price, it is a matter of 5½ cents, ie consumer pays 6 cents a bar for it. That is the practical working f it.

Senator SMOOT. If you put less tallow in you put more oil in the iaking of your soap?

Mr. BARNES. The raw materials are interchangeable.

Senator SMOOT. Could you use more tallow than the 25 per cent nd make soap?

Mr. BARNES. We can use all the tallow that is produced in the world in the United States in soap making.

Senator McCUMBER. What I was saying is that the manufacturer, if there is a quarter of a cent added to the cost by reason of the tariff on tallow, can sell to the wholesale trade at a quarter of a cent a pound more, could he not?

Mr. BARNES. Absolutely. But tallow is only one of our items that is affected.

Senator WALSH. The importation of this tallow tends to serve as competitive with the tallow produced by these rendering companies who control the whole output of the United States?

Mr. BARNES. In some respects it has a leveling influence, because if the renderers are not satisfied with the price of tallow they are going to hold it, and it has that effect at times.

Senator SMOOT. Tallow is cheaper to-day than the oils, is it not?

Mr. BARNES. As a general rule tallow is. Tallow to-day is about 6¾ to 7 cents a pound.

Senator LA FOLLETTE. Is it a duty that you manufacturers can pass along without any difficulty; the duty retained upon tallow is an added cost to manufacturers that you can pass along?

Mr. BARNES. Absolutely.

Senator LA FOLLETTE. So that it is something that falls upon the consumer?

Mr. BARNES. Absolutely; it will mean 15 to 20 per cent advance on common laundry soaps in the United States.

Senator SMOOT. By the retailer?

Mr. BARNES. By the retailer to the consumer.

Senator LA FOLLETTE. Is your interest in being here to speak for free raw material solely one of consideration for the consumer?

Mr. BARNES. Absolutely; the cause of the consumer is the cause of the manufacturer. That has been the position of the soap trade right straight through in these tariff hearings, because so far as the soap trade is concerned it is not going to make one bit of difference to us in our manufacturing of soap. We are going to continue to make soap, but it will cost the consumer more.

Senator LA FOLLETTE. You are going to make just as much soap and you make just as much profit?

Mr. BARNES. We hope we will make some profit. We have not seen such a thing for so long that we do not know what it looks like.

Senator LA FOLLETTE. Where have you been during the war? [Laughter.]

Mr. BARNES. We were all right until the war ended, and then—

Senator LA FOLLETTE (interposing). You were all right until the war ended?

Mr. BARNES. Then the perpendicular drop in price came along, and the soap trade has been taking losses for two years.

Senator McCUMBER. Has it taken enough losses to balance the profits during those war years?

Mr. BARNES. We have lost it all.

Senator LA FOLLETTE. What is your protection—what duties do you have on soap?

Mr. BARNES. We asked the Ways and Means Committee to leave soap stand where it was.

Senator LA FOLLETTE. Where did soap stand?

Mr. BARNES. That we were not interested in a duty on imported oap; that the soap makers in the United States were well able to ake care of themselves.

Senator LA FOLLETTE. Notwithstanding——

Mr. BARNES (interposing). They increased it for us.

Senator LA FOLLETTE. Then, you did not want it?

Mr. BARNES. No, sir; and then they turned around and interfered ith our whole relations in this country on our raw materials.

Senator WALSH. I think the soap people wanted soap free if the aterials were made free.

Mr. BARNES. That was one of our statements; yes, sir.

Senator LA FOLLETTE. Do you want this increase on the manuctured product, which has been put into the Fordney bill, if the uty upon tallow is to be retained?

Mr. BARNES. We care nothing about that. It can leave soap here it was so far as the soap trade is concerned.

Senator LA FOLLETTE. Even though the duty on tallow be reined?

Mr. BARNES. That puts the soap trade at a disadvantage, there is question about that.

Senator LA FOLLETTE. Just what disadvantage does that put you to?

Mr. BARNES. For the simple reason——

Senator LA FOLLETTE (interposing). You say you can pass it ong without any difficulty, and that nobody will be hurt by it but e consumer. You arouse my curiosity a bit.

Mr. BARNES. For this reason, Senator——

Senator LA FOLLETTE (interposing). We have seen so much phinthropy in this country in the last three or four or five years and much keenness of interest in the consumer that we become a bit eptical.

Mr. BARNES. Our keenness so far as the consumer is concerned, of course, to attain a small unit of price, because naturally in the ap business, as well as any other business, when your unit of price small your consumption is larger and we can not attain that low it of price if our raw materials are taken off the free list. It is t entirely philanthropy.

Senator LA FOLLETTE. How much laundry soap do we export?

Mr. BARNES. About $14,000,000 was exported, I think, in the last ar.

Senator LA FOLLETTE. About 100,000,000 pounds?

Mr. BARNES. I think that is correct. I have it in the brief here.

Senator LA FOLLETTE. We are able to walk right into the foreign ade in a pretty lusty sort of a way?

Mr. BARNES. Yes, sir; but we will lose it all if our raw materials e made dutiable.

Senator LA FOLLETTE. It would raise quite a lather, I should ink. [Laughter.]

Mr. BARNES. It has taken us years of effort to build this export siness up.

Senator CALDER. Has the witness testified how much soap was ported last year?

Senator WALSH. That is all in the record.

Mr. BARNES. It has been all presented, and I have a brief that I would like to offer.

Senator McCUMBER. Very well; that will be printed as part of your remarks.

BRIEF OF THE LAUNDRY SOAP MANUFACTURERS OF THE UNITED STATES.

A duty of one-half cent per pound is proposed in the Fordney tariff bill upon animal tallow. This duty would be prohibitive of imports and would, therefore, yield [illegible] revenue.

Animal tallow is on the free list in the tariff of 1913, paragraph 622.

Under the tariff act of 1909 a duty of one-half cent per pound was placed on tallow. While this duty was in force there were practically no importations, the average importations being only 750,000 pounds annually.

The tariff act of 1905 placed a duty of three-fourths cent per pound on animal tallow. While this duty was in effect the importations of tallow were even less than while the duty of one-half cent per pound was operative. In 1908 the importations were only slightly over 300,000 pounds.

During the entire eight years that a duty was in force on tallow importations the average revenue income was only $3,576.70. It is obvious, therefore, that a tariff on animal tallow creates an effective embargo upon imports because the laundry-soap maker can not afford to buy it with the duty added to its value. Further, inasmuch as imports decrease to negative volume under the weight of a duty no revenue worth of consideration is resultant from such duty. The following table shows the annual importations and exports of tallow from 1908 to 1920, inclusive, together with the prevailing rate of duty in force:

Year.	Imports.			Exports.	
	Duty.	Amount.	Value.	Amount.	Value.
	Cent.	*Pounds.*		*Pounds.*	
1908	¾	304,765	$23,074	91,397,507	[illegible]
1909	¾	364,964	28,299	53,332,767	[illegible]
1910	¾	117,464	7,081	....	......
1910	½	794,008	61,402	29,379,992	[illegible]
1911	½	984,383	81,640	29,813,154	[illegible]
1912	½	347,837	25,595	39,451,419	[illegible]
1913	½	880,283	70,618	28,264,622	[illegible]
1914	Free.	12,698,519	833,549	9,980,066	[illegible]
1915	Free.	3,577,476	233,068	26,868,703	[illegible]
1916	Free.	13,086,640	1,070,759	15,338,057	[illegible]
1917	Free.	73,619,524	9,997,325	7,805,880	[illegible]
1918	Free.	51,885,808	7,444,230	4,222,657	[illegible]
1919	Free.	12,096,189	1,812,093	38,953,783	[illegible]
1920	Free.	13,398,885	1,720,136	17,494,887	[illegible]

It will be noted from the above that when the duty was removed from tallow [illegible] 1913 that importations began to enter the country in fair volume. It will be further noted that in the 13 years covered by the above table that 10 years of the 13 show preponderance of exports over imports, which in most of the years in which this condition obtained amounted to many millions.

With an exportable surplus of tallow in the United States it can readily be seen that there is no need for a duty upon tallow and no stronger reason could be furnished [illegible] the retention of tallow upon the free list as provided in the act of 1913.

The following table reveals the consumption of animal tallow by the soap makers of the United States during the years 1912, 1914, 1916, and 1917:

Year.	Pounds.	Percentage of total fats and oils used.
1912	238,685,000	[illegible]
1914	270,713,000	[illegible]
1916	338,931,000	[illegible]
1917	362,297,000	[illegible]
Average annual consumption	302,656,500	....

From the above table it will be noted that animal tallow is one of the most important ısic raw materials used in the manufacture of soap, the percentage used varying om 27.1 to 30.7 of all oils and fats used in the manufacture of soap.

The animal tallow which is imported into the United States for the use of the soap akers originates in South America, Australia, and New Zealand for the most part, ith importations of less consequence from China. The soap maker, it should be ointed out, is interested only in inedible tallow, the grade of tallow commonly used r soap. He is not interested in the grade of tallow classed as edible as relates to mestic tallow or to imported tallow.

While the importations of animal tallow are not large under normal conditions, they e, nevertheless, important, first, in that they contribute to the miscellany of fats d oils which the soap maker must constantly have available to draw upon with the ward fluctuations of the market and without which wide range of choice the price common soap would fluctuate up and down the price scale in place of remaining most constantly a fixed entity. Under previous tariff acts in which his raw materials ve entered free of duty, the soap maker, with the stocks of the world to draw from, s been able to change his formula as one oil or fat ascended in price to a height yond which the soap maker could reach to another oil or fat less expensive, thereby abling the soap maker to hold the price of a bar of soap at a low level. Following t this line of procedure the soap maker, when the price of tallow goes beyond his ach, is not forced to change his formula, but merely switches to South American llow. He may buy only sparingly, but by this respite he is able to hold the price common soap at a constant level.

We come, therefore, to the second benefit resultant from free animal tallow which that the importations exercise a price leveling influence preventing the upbuilding artificial domestic prices, a benefit which directly redounds to the public good as e price of soap thus remains at a constant low level.

That the soap maker does pass on to the consumer the savings which he effects in e purchase of his raw materials is undeniably manifested in the constantly low price common soap. It is, of course, not to be adjudged that the soap maker is of more ilanthropic turn of mind than other business men, for as a point of fact the laundry-ap business is of such highly competitive nature that every manufacturer is com-lled to sell the consumer the lowest possible priced soap consistent with the quality d size of the cake if he expects to retain or increase his business. In the highly mpetitive laundry-soap field, therefore, the only factor which can increase the price soap throughout the United States is the marked increase of the price of soap makers' w materials. So long as the soap maker can, by the exercise of the greatest agility, itch from one oil or fat to another the price of soap stays down and the length of ne which the price stays down depends upon the freedom of choice which the soap aker possesses in drawing upon the wide world supply of raw materials. Limit his ility to do this, however, and force him to make soap from high-priced edible oils d the price of laundry soap will no longer remain a synonym of cheapness.

The widespread distribution of soap factories throughout the United States and the mparatively large number of these factories make for the most active competition. ere are and can be no territorial divisions of markets in the soap business and no gulation of volume of business or prices among the 371 soap makers of the United ates distributed as they are from Maine to California.

We give herewith report from the 1914 "Census of Manufacturers" showing total mber of soap makers in the United States and their location:

w York	65	Maryland	3
linois	27	Connecticut	12
w Jersey	16	Georgia	2
nnsylvania	50	Kentucky	3
ssouri	9	Tennessee	3
hio	30	Texas	8

isconsin	11	Washington	2
hode Island	11	All other States	22
wa	8		
innesota	6	Total	371
ichigan	11		

A TARIFF ON ANIMAL TALLOW WOULD NOT BENEFIT THE FARMER.

There are two grades of tallow produced in the United States, the first of the[illegible] grades is edible tallow and naturally commands the highest price. In this grad[illegible] of tallow the soap maker has no interest as he can not compete with the manufactur[illegible] of edible products. The second grade of tallow is the inedible tallow of which th[illegible] soap maker uses practically the entire production of the country with the excepti[illegible] of the exports and small quantities used for stuffing leather, in lubricating grea[illegible] and similar technical usages.

The following table reveals the total production and consumption of tallow, ed[illegible] ible and inedible, during recent years, together with imports and exports dur[illegible] these years:

Year.	Production.	Consumption.	Imports.	Exports.
1914	370,586,000	366,294,000	12,690,000	9,[illegible]
1915	411,295,000	374,143,000	3,577,000	26,[illegible]
1916	428,493,000	411,246,000	13,087,000	15,[illegible]
1917	422,013,000	481,060,000	73,620,000	7,513,[illegible]
1918	450,820,000	541,714,000	51,886,000	4,[illegible]
1919	472,846,000	449,748,000	12,096,000	[illegible]
1920	300,344,000	284,433,000	14,935,000	20,[illegible]

The average annual consumption of tallow, both edible and inedible, as shown b[illegible] the above table is slightly over 400,000,000 pounds annually.

From table two of this brief it will be noted that the consumption of tallow by th[illegible] soap industry averages about 300,000,000 pounds annually. This is inedible tall[illegible] only, the balance of the tallow shown as consumed going into edible products.

By comparing consumption in the soap industry with total tallow consumptio[illegible] the United States it will be seen that the soap maker uses three-fourths of all the tall[illegible] consumed in the United States. Inasmuch as the soap maker can afford to use o[illegible] inedible tallow it can be said inferentially that at least three-fourths of the tall[illegible] consumed in the United States is inedible tallow. We stress this point becaus[illegible] desire to bring out the fact that in the consideration of the matter of animal tallow [illegible] relation to tariffs that the soap maker is primarily concerned and will be the ch[illegible] sufferer from the effects of a duty. Likewise the soap maker is about the only ma[illegible] facturer who has any important desire or need to import tallow, as the imports of tall[illegible] for purposes other than soap making are negligible.

Inasmuch as the experience of former years when tariffs on tallow were in eff[illegible] proves that a duty on tallow is nonproductive of revenue owing to the soap make[illegible] inability to buy the tallow to the value of which a duty has been added, we will n[illegible] examine into the element of protection to American products involved in an imp[illegible] levy upon tallow.

The following table from Bulletin 769 of the United States Department of A[illegible] culture reveals the production of edible and inedible tallow by the packing hous[illegible] the United States:

Tallow production, edible and inedible.

Calendar year:	Pounds.	Calendar year:	Pounds.
1912	202,946,000	1918	304,[illegible]
1914	227,339,000	1919	251,[illegible]
1916	275,511,000	1920	263,[illegible]
1917	268,825,000		

Of the above production of tallow we will again point out that the soap ma[illegible] is interested in only the inedible grade of tallow.

The yield of inedible tallow per head of cattle slaughtered in the United S[illegible] is about 7 or 8 pounds. The former figure was included in the testimony of the pa[illegible] at Chicago and is therefore probably more nearly accurate. The slaughter [illegible] cattle under Government inspection for the fiscal years ending June 30, from [illegible] to 1920, inclusive, are given in the table below along with the estimated yi[illegible] inedible tallow which would be produced therefrom on the basis of 7 pound[illegible] inedible tallow from each head of beef live stock.

attle slaughterings under Government inspection and estimated yield of inedible tallow therefrom.

Year.	Cattle slaughtered.	Estimated inedible tallow produced.	Year.	Cattle slaughtered.	Estimated inedible tallow produced.
		Pounds.			*Pounds.*
1911	7,781,030	54,467,210	1916	7,404,288	51,830,016
1912	7,532,005	52,724,035	1917	9,299,489	65,096,423
1913	7,155,816	50,090,712	1918	10,938,287	76,568,009
1914	6,724,117	47,068,819	1919	11,241,719	78,692,033
1915	6,964,402	48,748,814	1920	9,709,719	67,968,033

It will be seen that on the basis of the maximum years' slaughterings of cattle as ached in 1919 the production of inedible tallow by packing houses was 78,692,033 ounds. The greater part of the inedible tallow produced in the United States is the oduct of tallow renderers who accumulate the scraps from butcher shops, restaurants, c., and in which the farmer has not the slightest concern. The figure 78,692,033 presents the maximum amount of tallow which could be influenced by the proposed ty of one-half cent per pound on animal tallow in the Fordney bill on the basis of hich influence the American farmer or the packer could benefit. The price of edible llow will not be influenced because the inedible grade is the only grade on which e duty will be operative as previously explained.

The figure 78,692,033 pounds does not represent all the inedible tallow consumed by e laundry-soap maker but it is all that can come from the packing houses and therere all that concerns the American farmer. Let us see then how much the American rmer can benefit by the assessing of one-half cent per pound duty on the soap makers' llow.

The yield of inedible tallow from each 900 to 1,000 pound steer sent to market by e farmer, it has been stated, is 7 pounds. One-half cent per pound increase in price the 7-pound inedible tallow yield from the 900 to 1,000 pound steer would volve the tremendously important sum of 3½ cents. Granting for the sake of an gument that the duty of one-half cent per pound on tallow would raise the price of edible tallow an equivalent amount the increase in value on an entire carload of eers would not equal 75 cents.

It is necessary that it be kept in mind at all times in connection with our discussion a duty on animal tallow that this duty will be operative only on the inedible grade, this is the only grade imported.

Returning to the 3½ cents, while this would be a very small increased return on the rcass of a 1,000 pound steer, it should be stated that even this insignificant increase value would not result from the placing of a duty upon animal tallow, because the ap maker would not be able to purchase tallow if the price were raised and would ase using it, depending upon supplies of other oils and fats for his raw materials. we have repeatedly pointed out, the soap maker can not pay high prices for his raw aterials and make low-priced soap. If the price of one raw material becomes unduly gh he must change his formula and use other raw materials. If tallow becomes gh in price the soap maker must then make his choice from the next most suitable w material.

In former days when tallow was assessed a duty it was probably considered as a otective measure to a great many small packing houses scattered over the United ates. Since the combining of such plants into large packing-house organizations is understood that such protection has not been needed. According to the Federal ade Commission report of 1919 on the meat-packing industry 82.2 per cent of all er-state slaughter of cattle was by five packing houses and their subsidiary and filiated companies. It is not improbable that these five packing organizations oduce 85 per cent of the packing-house output of inedible tallow of the United ates.

OPOSED DUTY ON TALLOW IS VIRTUALLY PROHIBITIVE ON BASIS OF NORMAL VALUE.

The price of inedible tallow in 1914 and 1915 before the strain of filling European mands for glycerin and all fats and oils began to be felt averaged 6.36 and 6.33 nts, respectively.

The following table shows the average monthly price for the first seven months of 21 for the two most important grades of inedible tallow used by soap makers in the stern part of the United States.

Market prices on inedible tallow, 1921.

[Per hundred pounds.]

	Jan.	Feb.	Mar.	Apr.	May.	June	July.
City special tallow	$6.15	$5.61	$5.09	$5.00	$5.22	$4.80	[illegible]
Prime city tallow	5.33	4.69	4.10	4.00	4.00	3.54	[illegible]

The above market prices may be said to be those which will be a part of a norma price range such as will prevail in years to come. It can readily be seen therefor that with market prices for domestic inedible tallow ranging from 3½ cents per poun to 6⅛ cents per pound that an import duty of one-half cent per pound or from 14 .8 per cent ad valorem would prove an effective barrier to imports, particularly inedible tallow the ratio of interchangeability of which with the general run animal and vegetable oils and fats is high when considered in relation to soap making With an inhibition of imports it would naturally follow that the revenue yield wou be negligible.

If corroborative evidence is needed for our statement to the effect that a duty one-half cent per pound on tallow would be virtually prohibitive of exports an therefore essentially nonrevenue producing, reference need only be made to the fir table of this brief, in which it is shown that when the one-half cent per poun duty on tallow was in effect between 1909 and 1913 the yearly importations of tall dried up to the faintest trickle, averaging less than 745,000 pounds annually, and th at a time when relatively the same scale of market prices prevailed as to-day.

The laundry-soap maker in asking that animal tallow be retained on the free li has in mind fundamentally the necessity for the needs of his business of a flexib supply of raw materials. The addition of a duty on animal tallow will merely d crease the number of imported raw materials upon which he can draw by one. Th has been demonstrated by the effect of a duty upon tallow in the two tariff a prior to 1913.

The soap maker would not be forced to pay more for domestic tallow were a du to be placed upon imported tallow because of the wide interchangeability of oth fats and the several animal and vegetable oils with tallow. If tallow increased price to a point beyond which the soap maker could afford to pay he must perfor use other raw materials, and thus the domestic consumption of animal tallow decreased.

A DUTY ON ANIMAL TALLOW ACTS TO DECREASE DOMESTIC CONSUMPTION.

In 1912, with a duty of one-half cent per pound in effect on animal tallow, the s maker used 238,685,000 pounds of animal tallow; in 1917, with no duty in for used 362,297,000 pounds of animal tallow, an increase in consumption of 123,61 pounds, or 51 per cent.

The total exports of animal tallow from the United States for the six years pre 1914, when there was a tariff in effect on animal tallow, were approximately 270,00 pounds, or an average of 45,000,000 pounds per annum. The total exports for the years following the removal of the tariff were approximately 104,000,000 pound an average of 17,000,000 pounds annually. The inference to be drawn from th that under the stimulus of false ideas as to the value of animal tallow under the existing barrier of a tariff the holders thereof kept their product out of the channe domestic consumption, because the soap makers could not afford to buy as bea forcing larger quantities of it into export channels probably at smaller profit could have been obtained in the domestic market had same been properly encoura

The price-leveling influence of the small amounts of imported tallow which into the United States is as much in favor of the domestic tallow producer as the favor of the soap maker. It prevents the establishment of artificial prices domestic tallow, which may be pleasant to contemplate but are absolutely de of solid benefit to those who endeavor to maintain them, because when the artif high price is established the soap maker ceases to buy owing to his ability to use raw materials, and tallow which might thereby have gone into consumption rem unconsumed. Leave the market for tallow open to the unrestricted operation of laws of supply and demand and the domestic consumption of tallow will be lar increased.

We maintain that the foregoing observation applies to all animal and vegetable oils nd fats. Because of the interchangeability of these oils and fats a duty upon imorted oils and fats which are alleged to compete with domestic oils and fats would ijure the domestic product infinitely more than it will do it good through the autoatic damper placed upon consumption. Even if high prices were artificially created the markets for any domestic animal or vegetable oil or fat, their creation would itomatically create a vacuum of nonusage resultant not of profit to the domestic proicer who supposedly profits by them but of decreased consumption of his product id of lasting injury to his industry.

The soap maker asks that animal tallow be retained on the free list not because he is rced to use it but because the imposition of a duty will interfere with the welldered conduct of his business, because the duty will be productive only of annoyance the soap maker and nonproductive of customs revenue or of benefit to the farmer, e packer, or other domestic producer.

Paragraph 498, free list, act of 1913, "Greases, fats, and oils (excepting fish oils) not emically compounded such as are commonly used for soap making." Because of e fact that there are certain nondescript soap makers' raw materials which have no finite classification and which are of importance in the aggregate it is respectfully quested of the committee that such a paragraph be included in the pending tariff asure.

Laundry-soap manufacturers of the United States: F. M. Barnes, Procter & Gam- Co.; Russell Colgate, Colgate & Co.; F. R. Collingwood, Fels & Co.; Louis H. ltke, Wm. Waltke & Co.; N. N. Dalton, Peet Bros. Manufacturing Co.

Senator La Follette. Your post-office address is Cincinnati?

Mr. Barnes. I am connected with the Procter & Gamble Co., ncinnati, Ohio.

Senator La Follette. I am going to write you a letter.

SAUSAGE CASINGS.

[Paragraph 706.]

ATEMENT OF A. W. KEMPNER, OF F. S. OPPENHEIMER & CO., NEW YORK CITY.

Mr. Kempner. My name is A. W. Kempner, of F. S. Oppenheimer Co.

Senator Smoot. Have you a brief that you desire to file?

Mr. Kempner. I have been selected by the members of the trade their spokesman in order to save your valuable time. I represent umber of houses whose representatives are present and a number o are not. I should like to submit a list of those who are here d those whom I represent.

(The list referred to is as follows:)

resent: Standard Casing Co., New York City; M. Brand & Sons, New York City; th Levi & Co., New York City; Oppenheimer Casing Co., Chicago; Brecht Co., Louis; F. S. Oppenheimer & Co., New York City.

he following firms are represented by Mr. A. W. Kempner: Early & Moore, Boston; nstein & Co., New York City; Wolf, Sayer & Heller, Chicago; M. Ettlinger & Co., York City; E. Heymanson Co., New York; Drodel Co., Brooklyn; Massachusetts porting Co., Boston.

Senator La Follette. With what firm are you connected?

Mr. Kempner. F. S. Oppenheimer & Co.

would like to say that the gentlemen for whom I am authorized speak dispose of fully 95 per cent of the sausage casings which are ported into the United States.

When the Fordney bill was reported it came as a surprise to the ing trade to find that sausage casings had been removed from the

free list, where they had been for over 50 years; and this is the
opportunity that the trade has had to submit a protest.

Senator SMOOT. Congressman Rainey sent over a letter addr-
to him, inclosing a brief. Do you want this brief printed?

Mr. KEMPNER. I should like to read a few notes elaborating up
this brief.

House bill No. 7456, in paragraph 706, page 95, proposes to
a duty of 15 per cent on sausage casings.

"Sausage casings" is the commercial term for the cleaned in-
tines of sheep, cattle, and hogs, and are used as containers for saus-
likewise for the manufacture of surgical ligatures.

For the past 50 years sausage casings have been on the free
and in the present 1913 Underwood-Simmons tariff they app-
under paragraph 419.

Sausage casings are produced from sheep, hogs, and cattle,
have always been considered as providing a means of utilizing
desirable and cheap food product trimmings, cuts from pri-
pieces of beef, pork, mutton, veal, and other parts of food anim-
in the form of sausage, which is recognized as the poor man's food

The total imports for the year 1919, from the latest available
tistics, were valued at $5,629,412, estimated to have been made
as follows——

Senator CURTIS. This last June report shows $6,427,000.

Mr. KEMPNER. These figures were not available to me at the
this memorandum was prepared. I sent to the customhouse
them but could not get them.

These imports are estimated to be made up as follows: Sheep
ings, 85 per cent; hog casings, 10 per cent; cattle casings, 5 per

It will be readily observed from these figures that sheep casin-
form by far the larger part of the entire importation, and th-
due to the fact that this article is absolutely required for the ma-
facture of so-called Frankfurter sausages, one of the most popu-
food articles in this country.

The sheep casings produced in the United States are comparativ-
of inconsequential quantity. Owing to certain soil and bree-
conditions, they are of an inferior quality, and do not supply, co-
servatively speaking, more than 10 per cent of the quantity actu-
required. The other 90 per cent have to be obtained from for-
countries.

The importation of the hog casings (10 per cent of total) is ma-
necessary by the shortage of sheep casings, as certain calibers
hog casings can be used at times in place of sheep casings. Th-
United States produce large quantities of hog casings, which a-
consumed here and a large surplus exported to all parts of
world.

Cattle casings are also produced in large quantities in this count-
being partly consumed here, and the surplus exported principa-
to European countries. Consequently, as hog casings and catt-
casings are produced here in quantities exceeding home consum-
tion, and heavily exported, they require no protective duty.

While the imports of sausage casings in 1919 were valued
$5,629,412, it is estimated that for the year 1921 imports will
exceed $4,000,000, due to deflation, greater purchasing power of

ollar, and to decreased consumption, so that for revenue purposes ıey will yield only about $600,000 if taxed 15 per cent.

The imposition of a 15 per cent duty on sausage casings will add t least one-half cent per pound to the cost of manufacturing sausage, ıd as the article passes through the hands of a number of interediaries before it eventually reaches the consumer, each of these termediaries will add a percentage of profit. This pyramiding, it estimated, will finally result in enhancing the price of a pound of usage from 1 to 2 cents. I have been told since by practical manucturers that it will probably reach 3 cents.

Senator SMOOT. How many pounds are consumed in the United ates?

Mr. KEMPNER. There are representatives of the sausage makers the United States present who have those figures, I believe. I n not able to speak for them. It is an enormous quantity.

Senator SMOOT. I thought you knew, because you said there ould be only $4,000,000 of importations.

Mr. KEMPNER. That is casings.

Senator SMOOT. That is what I say. We are talking about casings.

Senator CURTIS. Twelve million seventy-one thousand, to the lue of $6,000,000, for the year ending June, 1921, according to this port. At the same time there were exported 29,000,000 at a value $5,000,000.

Mr. KEMPNER. For the manufacture of surgical ligatures, for wing wounds, the domestic casings, because of inherent defects, e far inferior to the imported, and to tax these would affect every spital in the country, and eventually the patient.

Prior to the war, German and other European merchants controlled ge quantities of sheep and hog intestines produced in various secns of the world. During the war American houses acquired a large rcentage of the raw material. In order to do so, long-time purchase ntracts had to be made, some of them extending over a period of e years and heavy investments were requisite. To-day these nerican merchants are selling this merchandise which they wrested m the German and other European merchants to Germany and ewhere in Europe.

To impose a duty of 15 per cent on sausage casings means that the vantages gained by the American merchants will be completely stroyed, and the "drawback" and "in bond" privilege offers no ief because these casings, salted for preservation only, must come the United States for examination and selection, and could not be pped direct to Europe from the point of origin because of the essary inspection and selection. If the new tariff is intended to otect American merchants, it would utterly fail to do so in this rticular instance, and would entail a heavy loss to those interested.

The above argument applies not alone to sheep casings but also certain grades of hog casings which are imported from China, and m which merchandise substitutes are selected to make up the rtage in certain grades of sheep casings.

As a protection to home industry, no one but the large slaughterers uld gain any advantage, as it would not benefit the farmer or tle grower, for the reason that the entire intestines of a herd of tle in the raw state are valued at 10 cents per head, and of sheep

at 6 cents. Assuming that the slaughterer would benefit to the extent of 15 per cent, this would equal from 1 to 1½ cents per animal, and the slaughterer could not, because of the insignificant amount, add it to the price he pays the cattle raiser.

That domestic sausage casings require no protection is established by the fact that the exports from the United States for the year 1919 were valued at $6,810,000, against imports of $5,629,412 (of which 85 per cent were sheep casings).

The main and most serious objection to a tariff on sausage casings is that it would affect the working class almost entirely, with whom a large part of its meat diet is in the form of sausage, a wholesome palatable food, with high nutrition value and containing no bone or other inedible substance. It is in fact a 100 per cent food article.

The arguments presented in the House protesting against a duty on hides can be applied to sausage casings, even more strongly so, as sausage is a food article consumed almost entirely by the working classes, and it can not be the desire or intention of Congress to increase the cost of a food article daily consumed in enormous quantities by the poorest classes, of whom millions are at present without employment.

For the reasons above stated it is urged that sausage casings remain on the free list as they have been for the past 50 years.

The home industry requires no protection. The revenue that could be collected would be extremely small, and a disproportionate burden would have to be carried by the poorest class. American merchants who have during the war secured advantages will be occasioned considerable monetary loss to the advantage of foreigners.

Tersely expressed, the importer does not want it, the manufacturer do not want it, the workmen do not want it, it won't help the farmer and the public certainly opposes it.

Senator SIMMONS. How do you think it got into the bill?

Mr. KEMPNER. I beg your pardon?

Senator SIMMONS. What influence do you think brought about its inclusion in the bill?

Mr. KEMPNER. I can answer that best by repeating what Representative Hawley told me when I asked him that very question. I asked Representative Hawley why sausage casings had been included in the bill after they had been on the free list for over 50 years, and his answer was that he did not know; that there had been no discussion of the article; that it may have slipped in with a great many others.

I am not authorized by Representative Hawley to make that statement, but that is my answer to your question. He did not know why.

I might supplement my remarks by stating that the three main meat trade journals of the United States are all in favor of having sausage casings retained on the free list.

BRIEF OF THE OPPENHEIMER CASING CO., CHICAGO, ILL.

The tariff bill recently reported out of committee in the House contains a pro[illegible] (par. 706) placing a duty of 15 per cent on "sausage casings, weasands, int[illegible] bladders, tendons, integuments." For 50 years sausage casings have been [illegible] free list, although a few years ago a duty of 10 per cent was assessed on im[illegible] weasands by appraisers in New York, who held that weasands (lining of ox t[illegible] were not sausage casings.

In all previous tariffs sausage casings are designated as unmanufactured and salted or preservation only. This term was applied because on arrival in the United States nd before they were sold to the trade it is necessary that they be graded for caliber nd length, freed from holes, threads, and other defects. In cases where they are not graded by importers, it is done by the manufacturer of sausage before using the asings as a container for meat.

Sausage casings are the intestines of sheep, hogs, and cattle. They are produced n many varieties of quality, caliber, length, and strength the world over. Imports om statistics issued by the Department of Commerce are as follows:

916	$3,857,084
917	4,235,514
918	3,508,434
919 (11,234,028 pounds)	5,629,412
920 (12,734,290 pounds)	7,047,437

The figures for 1919 and 1920 we consider excessive. These importations are not assified by animals, but we believe they might safely be computed as follows: heep casings, 85 per cent of total; hog casings, 10 per cent of total; beef casings, 5 er cent of total.

SHEEP CASINGS.

Sheep casings are imported principally from New Zealand, Argentina, Australia, nd Russia. They are used in the manufacture of what is known as Frankfurters, iennas, or "red-hots." The domestic killing of sheep is, roughly, 9,000,000 head, nd the intestines from this domestic killing will not suffice for the production of usage in the United States; firstly, because of their inferior quality; secondly, because of their inferior size (chiefly narrow, whereas imported goods yield medium ide and wide sizes); thirdly, because the quantity required is at least 30,000,000 testines, or more than three times what can be produced here. There is a worldide quest for sheep casings for importation to and consumption in the United States.

HOG CASINGS.

The killing in the United States varies from 30,000,000 to 35,000,000 hogs per annum, hereas the production is about double the domestic consumption, the balance being ported to all parts of the world, but chiefly England, Germany, and Spain. Since r 10 years China has been sending the intestines from 5,000,000 to 10,000,000 hogs r annum into the United States, where they are wanted because of their desirable e, being principally narrow.

BEEF CASINGS.

The killing in the United States is about 6,000,000 head and approximately double at is required for home consumption. The balance is exported into Germany, andinavia, Spain, and Italy. However, some portions of the intestines of cattle, own as beef bungs and bladders, are imported into the United States because these rticular portions are not produced in the United States in sufficient quantities to ер the domestic demand.

RÉSUMÉ.

1. A tariff on sausage casings is too broad a classification. There should be separate ssifications for casings taken from sheep, from hogs, from cattle.
2. A tariff on sheep casings (intestines of sheep) is unnecessary, because the domes- production is approximately one-fourth of the total consumption. It will therefore necessarily contribute to the cost of the production of an important food article.

ATEMENT OF WILLIAM GAUSSELIN, REPRESENTING THE SAUSAGE MANUFACTURERS OF CHICAGO.

Congressman BRITTEN. Mr. Chairman, I desire to present the following brief:

We, William Gausselin, Hugo Arnold, and Oscar G. Mayer, representing the sausage nufacturers in the city of Chicago, beg to lodge our protest against the suggested ty on sausage casings, covered by House bill H. R. 7456, paragraph 706, page 95, ich proposes to levy a duty of 15 per cent ad valorem on importation of sausage ings. The sausage manufacturer's objection to this duty, or, in fact, any duty on portation of sausage casings, is based on the fact that it is going to add, at 15 per

cent ad valorem, about $3,000,000 to an already heavy burdened sausage-eatin public, which naturally means to a great extent the poorer class, as 80 per cent of the sausage consumed in the United States is used in the mining and manufacturin centers. Using a 15 per cent ad valorem figure as a basis, it would mean an added cost to the manufacturer of about three-fourths cent per pound. Before reaching the consuming public this figure probably would be pyramided to 2 cents or possibly 2¼ cents per pound.

We desire to direct your attention to the fact that casings have been on the free list for the past 50 years; that 85 per cent of the sausage casings imported into the Unit States are sheep casings used in the manufacture of frankfurter sausage.

We require the intestines from 30,000,000 sheep to manufacture the frankfurte used in this country alone. It is estimated that this country kills 10,000,000 shee, of which 10 per cent are fit for sausage containers, the balance of 90 per cent bein unfit for sausage manufacturing on account of their tenderness and narrowness, the tenderness being caused by the feeding, soil, breeding, or atmospheric conditions narrowness being caused by the love of the American public for lamb instead of mu ton, requiring our sheep to be slaughtered while still at a tender age. There a about 150,000,000 pounds of sausage manufactured in the United States yearly stuf in imported casings. The above figures will show that it is necessary for us to impo the intestines of 29,000,000 sheep to fill our requirements. We might add that th are no sheep casings of any kind that are exported.

Following the facts as stated above, the net results would be that the America public would be compelled to pay an added $3,000,000, with a revenue to the Gov ernment of approximately $500,000.

STATEMENT OF MR. GOSNEY, REPRESENTING THE SAUSAG INDUSTRY OF CHICAGO.

Mr. GOSNEY. Mr. Guggenheim, of New York, has asked me t speak for him. Mr. Guggenheim represents the sausage industry o New York and I represent the sausage industry of Chicago. I mig say that I have had occasion to talk to almost every sausage man facturer in the United States, and I can safely say that I voice th opinion in making this statement.

Our reason for objecting to the 15 per cent tariff on the importati of sheep casings is that it is going to add to an already heavy burd of the sausage-consuming public, which means that the poor cl alone will have to pay about $3,000,000, in no particular territo but all over the United States.

Possibly 80 per cent of the sausage manufactured and consum in this country is used in manufacturing and mining centers. Wi a 15 per cent tariff it would mean that there would be added to th manufacturer's cost about three-quarters of a cent per pound. T the jobber it would be an added cost of about one-quarter of a cen To the retailer it would mean an added cost of 1 cent per poun making a total added cost of about 2¼ or 2½ cents a pound.

Senator SMOOT. That is the way we get our high cost of living.

Mr. GOSNEY. We have no control over the retailer. There a about 150,000,000 pounds of sausage manufactured in the Unit States yearly, stuffed in imported casings. Therefore the saus consuming public would be compelled to pay an added $3,000,00 with a revenue to the Government of about $500,000.

Senator McLEAN. What is the actual cost of the casing for sausage?

Mr. GOSNEY. With this added?

Senator McLEAN. Without it. What is the actual cost of th casing required for one Frankfurter sausage?

Mr. GOSNEY. It would average from 3¾ to 4¾——

Senator McLEAN. I am talking about one sausage, a "hot dog," as is sometimes called. How much does that casing cost?

Mr. GOSNEY. There are about 10 sausages to a pound, and they will average about 4½ cents to a pound of sausage.

Senator McLEAN. A little less than half a cent?

Mr. GOSNEY. Yes, sir.

Senator McLEAN. You claim that the retailer would add 3 cents a pound?

Mr. GOSNEY. Well, of course, the higher the sausage goes the more its shrinkage is.

Senator SMOOT. In other words, the added cost would be a half a cent a pound by the provision of 15 per cent, and the consumer would have to pay about 500 per cent more?

Mr. GOSNEY. No; the manufactured cost, I said, would be about three-quarters of a cent per pound.

Senator SMOOT. That is 50 per cent. Then go on with the others and add it up to 2½——

Mr. GOSNEY. Two and a quarter, I believe my statement was.

Senator SMOOT. I think you said 2½.

Mr. GOSNEY. That increase does not come from the manufacturer.

CREAM.

[Paragraph 707.]

STATEMENT OF CORNELIUS A. PARKER, BOSTON, MASS., REPRESENTING THE CREAM DEALERS' ASSOCIATION OF NEW ENGLAND.

Mr. PARKER. Mr. Chairman and members of the committee, I appear here representing the Cream Dealers' Association of New England, which is made up of a group of cream dealers, men who specialize in the sale of commercial cream. Their main business, and in some cases their only business, is the selling of cream produced in New England or imported from Canada, according to the conditions of the market and the necessities. Practically all of them handle the New England product as well as the Canadian product which they are obliged to use.

I will also say that the position we have taken in this matter has been indorsed by the Boston & Suburban Milk Dealers' Association, an association containing practically all the milk dealers in Boston, and the New England Ice Cream Manufacturers' Association.

We have approached this problem, as far as cream is concerned, as an independent problem from that of milk or butter, because commercial cream is something which is not entirely dependent, as far as the selling price is concerned or as far as conditions are concerned, on the butter market, although somewhat allied to that, and scarcely at all as far as the milk market is concerned.

New England is perhaps the only district which is particularly concerned with regard to the tax on cream as a commercial commodity. The heaviest year's imports of cream, I think, was 1915, and that year seven-eighths of the total supply of cream, approximately, that came

in from Canada came over the New England border. In other words, for some reason or other the importation of commercial cream is not apparently necessary to supplement the market in the Middle States as it is in the East; and that is practically the ratio, I think, that we find in each year, that perhaps seven-eighths, or at least a very large proportion, comes over the New England border.

Senator McCUMBER. That is probably due to the fact that the dairying interest is not developed at all in western Canada, and is more highly developed in eastern Canada contiguous to New England.

Mr. PARKER. I presume that is true.

Senator DILLINGHAM. Is it not a fact that the Province of Quebec produces 75 per cent of all the dairy products of Canada?

Mr. PARKER. Yes, sir. We find this situation, generally speaking, in New England, which I will speak of before taking up the subject according to the brief which I am ready to submit and have copies of for each of the members of the committee.

Some 20 years ago the cream supply came from northern Vermont and some from Maine and from New York for the Boston market. We were forced by the competition of the milk industry to go over the line for a portion of our supply. That came about largely because of the fact, I think, that prior to a decision of the Interstate Commerce Commission in 1916 the railroads made the same freight charge for any point beyond 160 miles. Beyond that it was the same as 160 miles; so that the milk producers could go out 300 miles for a milk supply and could bring it in at the same freight cost as it would be to bring it in for 160 miles. That was later changed by ruling of the Interstate Commerce Commission. But, meanwhile, the milk contractors had captured the producing section where the cream used to be produced.

We have also this thing to remember, that the cream which is imported as commercial cream and is to be sold as commercial cream is practically none of it sold north of Springfield, Worcester, and Boston, making a distance of perhaps some 250 miles on an average that it has to be transported before it reaches the point of general distribution. From a wholesaling standpoint, in other words, there is no competition with cream in the Quebec section and the cream from New England. It is purely a question of supplying the Boston, Worcester, and Springfield markets, and at certain times of the year it is an absolute impossibility to get the supply for the market that is required.

In looking at the question we have tried to consider the needs of the country measured from a revenue standpoint and also from a protection standpoint. My clients are all patriotic citizens and are, I believe, protectionists.

Senator DILLINGHAM. Can you tell us who they are?

Mr. PARKER. The Lyndonville Creamery Association, which has a very large business, and Mr. T. P. Grant, of the T. P. Grant Co., who do a very large specialized cream business.

Senator DILLINGHAM. Where?

Mr. PARKER. At Boston, getting his supply from Vermont and Canada.

Senator McCUMBER. Both of those firms are importers?

Mr. PARKER. They are importers and they handle the domestic product as well. They are not exclusively importers.

Senator WALSH. There are no exclusive importers of cream, are there?

Mr. PARKER. I do not think so.

Senator DILLINGHAM. Has the Lyndonville concern any creameries in Canada?

Mr. PARKER. I do not think they have manufacturing creameries; I will ask Mr. Grant.

Mr. GRANT. I only know of one. They did have one a few years ago across the line.

Mr. PARKER. They have their receiving stations and prepare it and take it across the line, but it is not strictly a manufacturing creamery.

Also, Tait Bros., of Springfield, handle a big part of the business in the Connecticut Valley. There are a number of other members in the association, but these are the men who are most interested in the question of importations; also the E. T. Luce Co., of Boston, who also handle a large business.

Senator WALSH. Of the cream that these companies handle, do you know what per cent of it comes from Canada and what part from New England?

Mr. PARKER. I have here some tables which will show pretty plainly, I think, what the situation is. I was going to take that up in order, but I will give it to you now.

Senator WALSH. Thank you. Just follow your own line.

Mr. PARKER. The cream dealers have taken the stand that they owe a certain amount to the Government for the privilege of conducting business, and from the standpoint of a revenue tariff they were all agreed to bear the rates as imposed in the Fordney bill; that is, the 6-cent rate on butter and 5-cent rate on cream. They are not particularly interested in the butter rate, excepting as it affects the general industry. They believe that the 6-cent rate is high enough on butter and that an 8-cent rate is not necessary. They are not interested in the butter business excepting as it may affect, in the decision of this committee, the cream question.

They also approve the 5-cent tax on cream up to 40 per cent. The House committee, I believe, has reported this, and it is before your committee at the present time, providing for a rate of 5 cents up to 30 per cent cream and 10 cents above 30. The great bulk of the cream that is imported, as the figures will show, is between 25 and 40 per cent. It is called 40 per cent cream imported practically at 38 per cent, perhaps to 40 per cent.

We believe that the 5-cent rate is higher than that. We do not say we could not do business on the other basis. We say that if a tax such as is proposed by the National Milk Producers' Association and the New England Milk Producers' Association were levied on cream the result would be to absolutely shut out the importations of Canadian cream, and then there would be no revenue produced from it.

On the other hand, we do not believe that the reaction of such a measure would be for the interest of the farmer, and we certainly know it would not be for the interest of the consumer, because the milk business is quite highly organized at the present time in Massachusetts; and at the very apex of the season, when the demand is highest and we can not secure the supply of cream in New England to meet the demands of the market, we would be faced with the necessity

of paying practically any price that the producers demanded, and the consumer would have to stand the freight.

Senator DILLINGHAM. Do you know the proportion that Canadian cream bears to that produced in New England?

Mr. PARKER. I have those figures here.

Senator DILLINGHAM. I mean, the cream imported.

Mr. PARKER. I will give you those figures. Senator Walsh just asked for a part of that, and I will give it to you right now. The comparison here is not for the full year, but it will give you an idea.

During the month of February, which was the first time that our Department of Agriculture tabulated it in this form, keeping milk and cream separately, our importations——

Senator WALSH. The State agricultural department are you referring to?

Mr. PARKER. Yes, sir. We shipped over the Boston & Albany Railroad into Boston——

Senator WALSH. Does that mean from other States?

Mr. PARKER. All the States of New England, and New York—30,177 quarts; over the Boston & Maine, 924,419 quarts; over the New York, New Haven & Hartford, 25,107 quarts. The Boston & Maine figure of 924,419 quarts included 30,000 quarts received from Canada, which was all that was received from Canada out of a total of 954,979. Of almost a million quarts received, only 30,000 came from Canada.

In March—of course we have to remember that these are the months of low demand—there were 34,700 sent over one railroad—

Senator McCUMBER. Can you not give us just the totals?

Senator DILLINGHAM. Just the comparative figures.

Mr. PARKER. I had not just compiled it in that form, but if you will give me just a moment I will give you the figures approximately.

Out of 1,300,000 brought into Boston during the month of March 52,720 came from Canada—52,000 as compared with 1,300,000.

In April, out of 1,600,000, 126,000 quarts came from Canada.

In May, out of 2,200,000 quarts, about 264,000 came from Canada.

In June, out of 2,425,000 quarts, 394,520 came from Canada. That was rather a high month.

Senator WALSH. The highest month is about 10 per cent?

Mr. PARKER. Yes. The high months come in June, July, and August.

We have telegrams and letters which would show that my client Mr. Grant, who is here and will tell you something of the intimate working details, during those months has been trying to get a supply from New England and has telegraphed and written and telephoned to practically every producing point in the territory and has endeavored through the Massachusetts Department of Agriculture and the Vermont Department of Agriculture to locate some supply without any success whatever.

Senator McCUMBER. Do you not think that if the protection was sufficiently high to make it profitable the year round the supply would be greatly increased in the United States through the New England section?

Mr. PARKER. I do not think so.

Senator McCUMBER. Of course you can not change that situation readily. It takes three years to produce a heifer that will raise a calf

to supply milk. You can not change your condition in a few months; but if there is that strong encouragement that can make it profitable to raise milch cows, do you not think that New England and that section could really supply the entire market?

Mr. PARKER. I do not think so, Mr. Chairman, for the reason that the demand for cream is a seasonal demand. In the warm weather during the summer months, in extreme warm weather, it is an impossibility to get a supply unless you have your creameries organized to take care of the cream supply for the full year. For nine months of the year the demand is so much less than it is during the summer months, when the ice cream season and the berry season are on.

During those months you have got to have that extra supply. The farmer wants to contract his cream for the full year. The same with his milk supply, or whatever he raises—he wants to contract for the full year. He does not want to do business for two or three months and then be thrown back on something else. Therefore it comes to a question of either treating it as just a surplus proposition and taking what you can get and not considering it as a definite business, which it is to-day, or it comes to a question of using the present methods.

Senator SMOOT. As I understand you, you think that the 30 per cent of butter fat which has a duty of 5 cents ought to be raised from 0 to 40 per cent?

Mr. PARKER. Yes, sir.

Senator SMOOT. You think that 6 cents on butter is sufficient? What do you think about cheese?

Mr. PARKER. I have not gone into the subject of cheese.

Senator SMOOT. You are down here as speaking for it. That is the reason I asked.

Mr. PARKER. I have not gone into the subject. I think it is an error in putting in that paragraph.

I wish to speak about some of the general conditions. Let me say one thing further with regard to the question which the chairman asked, and that is the fact that at the present time it is possible to manufacture sweet butter and manufacture that into cream, keeping in storage, and that displaces to some extent the use of cream. The minute you raise your cream market to a very high point, as will be done for three or four months of the summer, by a prohibitive tax, you will encourage on the part of the ice-cream dealers the use of storage and homemade butter into cream by a mixture of skimmed milk, with the result that your ice cream will take that product instead of taking cream; and to that extent you will discourage the cream industry of New England, which is one of the things that we have been trying to build up.

Senator DILLINGHAM. I would like to ask the witness one question.

Senator MCCUMBER. Certainly.

Senator DILLINGHAM. The people of my State are a good deal interested in this question. I have a letter from the commissioner of agriculture of Vermont in relation to differentials, which I would like to have you explain. I think you told me you thought you could find the way out of the difficulty. He says:

The trouble with the schedule, it seems to me, is that some of the items covering the materials from which butter is made are not in conformity with the duty levied upon

butter. For instance, the duty on fresh milk is 1 cent per gallon. There are about 12 gallons of milk in a hundredweight; therefore 100 pounds of milk can come into the United States to our creameries along the border with a duty of 12 cents. From this hundredweight there will probably be made at least 4 pounds of butter on the average, which if manufactured in Canada would take a duty of 32 cents.

Coming in, in other words, in the form of milk would pay a duty of 12 cents; coming in in the form of butter it would pay a duty of 32 cents.

Mr. PARKER. I should consider particularly the question of harmonizing the cream and butter. I want to say that I do not think you will find that the milk and butter markets follow closely together at all. The milk market is fixed on a collective bargaining basis—the milk market in the United States and New England—between certain big contractors and the producers acting as a unit. The butter market is dependent on more factors than the mere cost of production or the cost of getting into the country. It is dependent on the supply, and at times, as, for instance, which happened this last year when the Boston butter market was broken absolutely for 6 or 7 cents a pound by the shipping into New England by Nelson Morris & Co., I think it was—one of the large packer concerns—of a very large supply of butter, and which was thrown overboard at a low rate. Therefore, the milk and the butter market are not governed by the same considerations.

As far as the harmonizing of cream and butter——

Senator McCUMBER (interposing). What was that importation—Danish butter?

Mr. PARKER. No; this was, I think, homemade butter. There had been some Danish butter come in during the last year, but this was cold-storage butter.

Senator McCUMBER. You used the words "shipped in."

Mr. PARKER. Shipped in from the West; yes. Now, with regard to the harmonizing of cream and butter, I want to say that the selling price of cream does not follow exactly the butter market. It is bought on a butter-fat basis, but if the market on butter goes up there is a range of 2 or 3 cents on the amount of butter fat in a pound of butter that the dealers do not immediately reflect the range—there is a range of 2 or 3 cents that they do not necessarily change on the change of the butter market; in other words, it is more stabilized for a certain period of time.

However, the attempt has been made by the National Milk Producers' Association committee from New England to insist on a basis of harmonizing butter and cream on the basis that here [illustrating] is a line in Canada and here is a line in the United States, and you take those half a mile apart, and you take cream and import it at a certain rate and manufacture this over the line, and you will find that there ought to be a larger tax provided there in their rates.

That is all right in theory, but it does not work out, and it does not work out for this reason, because there are cartage charges; there is a premium on the grade of cream for commercial cream. There is the freight as compared with butter from the point where that would be entered into the country to Boston, Springfield, or Worcester, whereas the butter freight would be very low.

I will not take the time, because I am informed my time is passed—but I have the figures right here in the brief to show you what cos

stitutes the actual harmonizing on the present rates, which would leave it practically where it is.

Senator DILLINGHAM. To help you understand what I have in mind, I will read you another extract from Commissioner Brigham's letter. He says:

> Take the case of fresh cream testing less than 30 per cent fat, which in the Fordney tariff takes a duty of 5 cents per gallon. A farmer on a creamery in Quebec may ship a gallon of fresh cream testing 25 per cent to a creamery in Vermont at a duty of 5 cents. This gallon will make approximately 2½ pounds of butter. If this cream were manufactured in Quebec into butter, the duty would be 20 cents, while the cream gains admission for 5 cents.

Does your plan meet that proposition?

Mr. PARKER. I will give you a plan to meet that question, if you have any fear of it; but, as a matter of fact, some people started—I think that was the same in the Payne-Aldrich rate as in the emergency bill—and tried that right along the line, and it did not work out for practical reasons, and they have practically abandoned it.

Mr. GRANT. That was 1910.

Mr. PARKER. I do not know of any concern that is importing cream from across the border and manufacturing it into butter, and there was a tax of 2½ cents under the Underwood Act and cream was 3, and they might have imported it that time or in the past four or five months, when the Fordney Emergency Act has been in effect, and these things have not happened. They have not happened all these years, and we do not believe it is necessary to look for possible trouble. But we will make this suggestion, that if this committee is worried on the question of harmonizing, that if they give us a cent rate up to 40 per cent cream, that we are willing they should tax us as they see fit in excess of 40 per cent on cream introduced into this country for purposes of manufacture. There are only a few concerns handling this, and it would be a comparatively simple matter to differentiate in your tax between cream imported and manufactured into butter and cream imported as commercial cream and to be sold as commercial cream.

Senator DILLINGHAM. Just a word further. There are creameries in New England that get cream from Canada?

Mr. PARKER. They get some cream from Canada along the border.

Senator DILLINGHAM. From information that has come to me it would appear that in one instance they claim they paid 90 cents freight on a 40-quart can of 40 per cent cream, that the duty on that would be $1, making $1.90. But now, on the figure of the commissioner, you make 37 pounds of butter. The duty if it came in in the butter would be $2.96, while in the other case the duty is $1 and the freight 90 cents, making $1.90. Have you any explanation of that, or do you care to discuss that problem?

Mr. PARKER. I think that that is pretty largely absorbed in the question of the extra cartage on your cream in jugs and in the fact that there is a premium paid up to 3 cents per pound of butter fat; it runs from 1½ to 3 cents usually for cream produced for commercial cream. My client, Mr. Grant here, who is the president of the association, can give you all the little points about that which I can not give.

Senator DILLINGHAM. I am only seeking light because I want to know what the situation is.

Mr. PARKER. I will file a brief, and I will simply say, in closing, that this question of the relation of exports of dairy products and imports I also want to call your attention to. I want to invite your attention to a table here in D (p. 2730) in a brief which I will file very shortly after the argument. That shows at the present time, as for years past, that we have been shipping from 6 to 15 times the amount of dairy products that we have been importing, and that in this last year, when there was a great cry about the importation of Danish butter, we were shipping butter across in larger quantities than we were importing, with the result that it must be that the American farmer was getting the highest market price.

Senator WALSH. You are now speaking of the country at large?

Mr. PARKER. I am speaking of the country at large.

Senator DILLINGHAM. These briefs will all be carefully read and digested. You need not think anything will be overlooked.

BRIEF OF CORNELIUS A. PARKER, BOSTON, MASS., REPRESENTING THE CREAM DEALERS' ASSOCIATION OF NEW ENGLAND.

On behalf of the Cream Dealers' Association of New England, I beg leave to present some facts which should be given consideration in the framing of the tariff relative [illegible] milk, cream, and butter. The same arguments apply in a greater or less degree to [illegible] these products, but I am more particularly interested in the cream schedule.

We maintain that in no case should a tariff be levied on these articles which exceed the difference between the United States and Canadian markets.

The general suggestions which obtain why no tariff should be levied which [illegible] unnecessarily raise the price of these articles to the consumer are:

(1) The fact that the question of dairy imports is principally a Canadian question. Do we desire to foster trade with Canada, which last year took from the United States $800,000,000 of goods, leaving a balance of trade in our favor of $300,000,000? If [illegible] we must not place a prohibitive tax on agricultural products, which make up the [illegible] of Canada's exports. We believe it will be admitted that regardless of the [illegible] ities of a retaliatory tariff it is impossible to sell Canada in the future to the [illegible] extent if any tariff bill prevents the import from Canada of its agricultural prod[illegible]

(2) Perhaps the most important factor in the cost of living is that of dairy prod[illegible] In 1919 the production of milk in this country was 90,000,000,000 pounds (appr[illegible] mately 45,000,000,000 quarts). Of this amount the use was—

	Per cent
For manufacture:	
Creamery butter	[illegible]
Dairy butter	[illegible]
Cheese	[illegible]
Condensed milk	[illegible]
Ice cream	[illegible]
Total manufactures	[illegible]
As fluid milk:	
Household purposes	[illegible]
Feeding calves	[illegible]
Waste, loss	[illegible]
Total	[illegible]

Any tariff which increases the cost materially strikes at every family, every [illegible] every invalid.

(3) Milk is the food of children and contains all the elements necessary for human sustenance, holding in proper balance protein, carbohydrates, fats, and salts, and [illegible] tains the vitamines essential for proper growth and development. It furnishes at [illegible] 20 per cent of the food of the average American family, and has no substitute for [illegible] proper nourishment of infants. (Tariff Information Surveys, Dairy Products, [illegible] reference hereafter to pages unless specified are to this document.)

(4) Cream is the most easily digestible form of fat, and as such is greatly in demand for invalids. There has been in the past two years a large increase in the consumption of cream for table use, and particularly for ice cream. This has been [illegible]

ıce the passage of the Volstead Act. The fact that over 2,000,000,000 quarts of milk ere used in this country in the manufacture of ice cream shows the importance of the ticle to the table.

I am submitting herewith some figures as to the shipments of cream to Boston on ble marked "A".

(5) If an attempt is made to keep the price of milk at as low a figure as possible for e consumer, it must be remembered that at least in the New England territory milk bought by weight and test, a premium being paid for butter fat in excess of 3.7 per nt. with the result that any unnecessary burden placed on cream or butter will tend raise the price of milk to the consumer.

(6) While there has been some international trade in butter, and considerable has en imported from Denmark in the past year, that import has practically ceased at e present time, it being apparent that Denmark can find a better market abroad. ithout question, completed statistics will show large shipments of butter abroad to lance these imports. (See inclosed clipping from Current Affairs, publication of e Boston Chamber of Commerce, under date of Apr. 25.)

(7) A study of the situation relative to the Canadian and United States markets dicates clearly that there has been no injury to the United States farmer because of e imports from Canada.

Table B gives a comparison of the Boston and Montreal markets from May, 1913, to pril 15, 1921. It will be noted that these figures cover a period during which there s been a tariff of 2½ cents on butter and cream has been free; also that frequently ontreal quotations are higher than those of Boston, as particularly for the years 15, 1916, and 1917, and that since January, 1921, the Montreal market has often en in substantial advance of the Boston market. Wednesday quotation, August . 1921, Boston 40 cents, Montreal 40 to 41½ cents. It will be remembered that ere was no difference in exchange prior to 1920, and had it not been for a favorable change rate no butter could have been imported during the last year.

Table C is the result of taking the tables on page 43 and adding to the Canada ice 2½ cents, the amount of the tariff act of 1913 in force while the prices prevailed. will be seen that with the addition of these figures Canada's average was higher by out 4 cents in 1914, practically the same in 1915, 3 cents higher in 1916, 2 cents gher in 1917.

The general considerations stated in paragraph 1 apply particularly to dairy products. Comparison of imports of butter and butter substitutes from Canada and exports butter alone to Canada for 5 years from 1913 to 1919, inclusive, practically all under e 1913 tariff act, show total in pounds: From Canada, 7,399,211; to Canada, 6,196,971. ee Dairy Products, United States Tariff Survey.)

In May of 1921 (see New York Produce Review) Canadian exports to United States butter were 22,399; imports from United States were 156,030.

These facts show the interdependence of this country and Canada for butter supply.

(8) International trade in fresh milk and cream has been limited to border trade ith Canada because of the highly perishable character of these products (see p. 10), e limit on fast refrigerating trains about 500 miles (see p. 12); also because of the ct that they are sufficiently bulky when handled in containers so that they can not moved any considerable distance from the entry point without considerable freight fferential against the Canadian product.

The total of imports and exports in 1919 were only a small fraction of 1 per cent of the lue of domestic production (p. 10), and as to the cost of production in the sections om which fresh milk and cream come, namely, Ontario and Quebec, the advantages dairying do not greatly differ from those of competing sections of the United ates (pp. 10 and 36). A comparison of wholesale milk prices (p. 21) shows for e years 1913–1916, inclusive, that the Montreal prices were at all times nearly ual to the Boston prices, being somewhat higher frequently, while Montreal and oronto prices ruled considerably higher than Chicago and New York prices. The eight differential between Montreal and Boston meets any normal difference between ese markets.

' See Table D (taken from tables, pp. 38, 39, and 41, Tariff Information Surveys, airy Products) to the effect that our butter exports have exceeded imports of butter and bstitutes in every year excepting 1915 since 1910, and that our exports have increased from approximately three-quarters of a million dollars to $15,000,000.

Adding butter substitutes exported shows a large balance in our favor, and for 10 ears, 1910 to 1919, inclusive, exports are six times greater than the imports.

(10) It is clear that the New England imports will make up a great part of the total ream imports from Canada, and if New England producers are not adversely affected ther parts of the country will not be injured.

In 1915 there was a total import into the country of 2,077,000 gallons, of which 1,735,000 gallons came in over the Vermont border (see p. 15).[1]

Also note that Boston prices are consistently higher than in any other large cities in the country (p. 15). and that since cream and milk were placed on the free list, while the milk imports have increased, trade in cream has not been so greatly affected.

Further, a study of tables (p. 9) shows that in 1918 the value of imports of dairy products was only 10 per cent of the value of exports. In 1917, 7 per cent, and in 1920, with the exchange in favor of the importer, only 16 per cent.

(11) That the dairy industry has not suffered during a period in which the tariff was at all times low and under which for some years milk and cream have been free and butter only 2½ cents per pound is shown by report on pages 11 and 12 and table on page 17 showing the number of dairy cattle in the country increased from 16,29[illegible] in 1920 to 23,747,000—approximately 50 per cent increase—and the value of the [illegible] was practically multiplied by four in that [illegible]

This indicates two facts, first, that farmers have increased the production per [illegible] by breeding and elimination of "boarders" or unproductive cows; and, second, [illegible] dairying has come to be recognized as a profitable branch of husbandry. (See p. [illegible] pars. 2, 3, and 4.)

(12) The United States should be careful to levy no prohibitive tariff on [illegible] products, not only for the effect on the price to the consumer, but because we [illegible] to encourage our export trade. At the present time that trade is making a rapid advance (see table, p. 10), showing that while imports for consumption grew [illegible] 1917 to 1920 about one million dollars, exports increased one and one-half million dollars.

(13) The United States and Canada are to a certain extent interdependent on each other in the matter of a cream and milk supply. Varying crop conditions in different areas affect production differently. Then, again, this trade has a seasonal aspect, highest production being April to June, heaviest consumption June to September.

While the total trade is small, it does come largely at seasons when the market [illegible] short and the absence of the small amount imported would give an unfair chance [illegible] profiteering.

This season investigation showed not enough cream to supply the legitimate [illegible] mands of the business for the summer months in the United States available [illegible] Boston market.

(14) There seems no good reason for considering it necessary to harmonize the cream tariff so as to bring it up to the tax on butter, if that remains at 8 cents per pound. If to be strictly harmonized, however, the following is the proper method of arriving at an equivalence and not the figures of the New England Milk Producers' Association, which are based on theory and not on actual working conditions:

As indicated in paragraph 7 of this memoranda, the imports of cream outside New England are negligible. There is no cream shipped into Vermont, New Hampshire, or Maine for consumption. The nearest points to the Canada line are Springfield, Worcester, and Boston, all upward of 225 miles from the border and points [illegible] A fair comparison of freight and cartage plus tariff reduces to absurdity the claim of the National Milk Producers' Association for 20 per cent ad valorem on cream. [illegible] cream shipped is about 36 per cent butter fat—a 10-gallon jug of cream contains [illegible] pounds of 36 per cent cream and contains 29.52 pounds of butter fat, which, with the churn gain, will make 35.42 pounds of butter.

The figures relative to freight and cartage are probably a fair average on both [illegible] and cream. It is necessary for purchasers of cream to pay a small premium over [illegible] butter market, ranging from 1 per cent to 3 per cent—in this comparison it is averaged at 1½ per cent. The subtraction shows the amount of tariff tax on cream necessary to balance (taking into consideration the freight charges and premium):

Freight, cartage, etc., on 35.42 pounds butter	$[illegible]
Duty at 8 cents per pound	[illegible]
Total	[illegible]
Freight, cartage, etc., on 82 pounds cream	$1.73
Premium over butter market	.30
	[illegible]
10 gallons required to balance, approximately	[illegible]

[1] Where the word "pounds" is used the word "gallons" should be substituted, as this is [illegible] an error.

However, if the imports from Canada were to be considered only, there is no need r a tax of more than 2½ cents per pound on butter from a standpoint of strict protec-ion. As no cream is imported from any other country than Canada, it is unfair to ibmit that product to the disadvantage of meeting a competition which does not rist. The theory advanced by the proponents of strict harmonizing is that a man ight buy cream, bring it across the border, and there close to the border manufac-ire butter. It was not done to any considerable extent when butter was taxed and eam free, nor when butter was taxed 6 cents and cream 5 cents. On the other hand, would be a perfectly simple matter to tax cream imported for manufacture of butter a different basis from that imported for commercial use. Heavier cream, sour eam, and other cream imported for the churn could be placed at rate harmonizing ith the butter tariff.

(15) It is apparent that the purpose of the proponents of a high tariff on dairy prod-ts have in mind prohibiting the import of these products. Articles of the New gland Dairyman, official organ of the New England Milk Producers' Association, ow clearly the purpose of the movement. On the other hand, with imports of 1,842,866 in value, and exports of $126,742,429, it is apparent that as a revenue-oducing schedule it will be a small factor. Under the Payne-Aldrich bill in 1913 ilk produced a revenue of $918, cream $62,287, and any increase over the Payne-drich rate will in our opinion place the imports on a plane where the law of dimin-ing returns will become effective and the income will be negligible.

(16) In the opinion of the cream dealers, the whole trouble with any tendency of akness in the butter market last year was the result of oleo and vegetable oil sub-tutes both manufactured and imported. So long as this is classed with butter ll the large packing houses be able to store butter both salted and sweet, for purposes homogenizing, and when overloaded ship same into the market to break prices, as s done in the spring of 1921. In closing, the cream dealers hold the increase of duty cream, butter, and milk above the 1913 tariff act as unnecessary from a standpoint protection, but advocate the rates as provided in the Fordney emergency act as the r share the business should pay in customs revenue for support of the Government. ey oppose any increase over those rates excepting that they do not object to an rease on cream of 40 per cent or more butter-fat content, sour cream, or cream im-ted for manufacturing into butter for the market.

am authorized to say that the New England Ice Cream Manufacturers' Association l the Boston and Suburban Milk Dealers' Association both have passed resolutions osing any increase beyond that provided in the Fordney emergency tariff act.

SUPPLEMENTAL BRIEF.

POSITION AND REQUESTS STATED.

)ur association reaffirms its position stated in brief filed August 30, 1921. We ›port the rates on cream and butter in effect under the emergency tariff law. We not believe the increase on cream over the present duty as provided in H. R. 7456 m 5 cents to 10 cents on all cream of 30 per cent or over is required to protect the ›ducer, or that it will materially increase the revenues. It will, however, probably prevent the importation of a sufficient amount to supplement the New England ›ply at the season of greatest demand, and will not, on the other hand, probably ›e the price sufficiently to deter the consumption of fresh cream by the public. our opinion any increase over the rates proposed in the House bill will bring about ›e results.

Ve are confident that a demand exists which is seasonal in its character and which New England producer will not meet. For nine months in the year we could bably supply the market from New England. However, creameries and producshould be equipped to handle sweet cream for the whole year, as its care and hand- are entirely different from that required by milk or butter. New England pro›ers, more or less, permanently contract their supply. This they do with the milk tra›tor or the creameries. Unfortunately, the demand for cream is a seasonal nand, and while there is a seasonal surplus of milk in New England, this surplus ›ys preceded the heavy demand of the summer months. Further, creameries ›e not cared to put their supply in the market for cream to a sufficient extent, even ›gh our dealers agree to contract for a year's time. It is a business requiring more e and trouble than either milk or butter, and many do not care to bother with it. use whatever New England cream we can obtain, importing comparatively little, epting in the months of shortage.

BUTTER.

Ve are not directly concerned with the schedule on butter, excepting for its effect the cream schedule. We believe the rate on butter in H. R. 7456 is as high as it uld be, and reasons are set forth in our brief of August 30, 1921, when the subject considered from the standpoint of comparison of Canadian and United States ›ket quotations and exports and imports.

HARMONIZING DUTIES ON BUTTER AND CREAM.

Ve maintain that it is not necessary that cream and butter schedules should be ›ely harmonized, for the reason that the sweet-cream business is a day-to-day busi- and that the cream market seldom follows sharp advances or decline sof the butter ›ket, also because the equipment of plants for handling cream is a different propo›n from that of those handling butter, and of the fact that it is not easy to shift ›tter factory onto a cream-producing basis. We have noted with interest the ›ments that cream might be imported across the border and manufactured on the ›an side, thus avoiding payment of a higher duty placed on butter. The fact this did not happen to any marked degree during the life of the Payne-Aldrich nderwood Tariff Acts, and has not happened during the time when the emergency has been in effect, would appear to indicate that the fear was unfounded.

PROPOSED SOLUTION ON HARMONIZING.

n the other hand, we meet this argument by the proposal that if it is the purpose he proponents of the higher rate to prevent such imports for manufacture the m duty shall be strictly harmonized as of the prices on each side of the border ›ut considering transportation costs on all sour cream, cream of over 40 per cent ter-fat content, and on all cream imported for manufacture into butter. We me that this could be provided for in the administrative features of the bill. amount manufactured by any of the cream dealers will, we believe, be found to negligible, as he pays a premium for extra care of pasteurized sweet cream for ›ket and will not manufacture it into butter.

IF PRINCIPLE WERE ADMITTED, PROPOSED BASIS OF HARMONIZING WRONG.

We take issue with the statements and proposals made on page 2209, of par and Exhibit D, page 2638, part 35, tariff hearings on H. R. 7456, schedule 7, and statements made by David Buttrick Co., page 2627, same document, regarding basis of harmonizing. The figures are based on theory and are made without knowledge of conditions under which Canadian cream is purchased. This was discussed in the brief filed by the Cream Dealers' Association on August 30, page 2213, part 29, of said hearings, and those figures are based on the actual conditions under which cream has been imported. It would seem perfectly app that with a milk market uniformly higher in the Canadian market than in the York market and only slightly lower than the Boston market producers in C will not permit the reaping of the profit which the said Exhibit D purports to

NO INCREASE NEEDED TO MEET CREAM COMPETITION.

As shown by figures of consumption, there is no competition between Ca cream and Vermont cream which is detrimental to the Vermont supply with tection of 5 cents per gallon. The principal argument of the producers is dir harmonizing cream with butter. If that is the purpose, the basis of harmo would be with allowances for extra cost of collection in Canada and extra cost essing and care, with allowances for transportation cost on cream from the points to Boston, Worcester, or Springfield (the only markets using any C products) and the transportation costs on butter for the same distances. Th ducers shift their basis when they reach the international boundary line from nizing with butter to comparing transportation costs to market of cream shipm one side of the line and on the other. The result of the proposed method of har ing will be to give a differential in favor of butter and encourage manufactur into sweet butter on the Canadian side.

We wish to call attention to statement of W. H. Bronson, pages 2623–2625, quoting a small portion of a paragraph from "The suggested reclassification vision of section relating to agricultural products and provisions." United Tariff Commission. "If it is desired to levy a duty on a butter equivalent to the milk it represents, the duty on 1 pound of butter should be 2.76 times th on 1 gallon of milk." He adds it is just a matter of mathematics as to how much fat there is in milk. It is not debatable at all. We have the United State Commission's statement to back up the rate that we ask for. And, further, 2624, there is stated as follows: "As I started to state, the Tariff Commission 11, paragraph 3, of the reference already cited, states that on the basis of equivalents the duty on light cream would naturally be 5 to 7 times that on and on heavy whipping cream about 8 to 10 times. At a rate of 3½ cents per gal milk, the equivalent rate on heavy cream would be from 29 cents to 36 cent gallon." We take issue with the quotation of parts of paragraphs which misrep the position of the United States Tariff Commission. In the document referred examination shows that while the commission has suggested, as the title in changes in many schedules, in this particular matter the paragraphs referred only with the butter-fat content equivalents and not with comparative co does the commission make any recommendation with relation to the desira of basing the respective rates in such equivalents.

In order to show how baseless a fear of Canadian competition is, we call atten particularly to the tables showing Canadian prices, exports and imports, and statistics contained in the brief referred to on page 2210 of said part 29.

FIRST ARGUMENT OF THE NATIONAL MILK PRODUCERS' FEDERATION.

Addressing ourselves more particularly to certain items of the various brief for a higher rate, we note on page 2592, in paragraph 3, in brief of the National Producers' Federation, the statement, "Should there be any attempt to trade farmer for foreign markets to place upon the free list, or near free list, his produ gain trade for protective industries, the same will not be patiently tolerated by a culture." We object to arguments of this nature, which would seem in the natu an implied threat. Realizing that the Senate Finance Committee is anxious for the interests of the whole country, we suggest in reply to the statement that are 4,000,000 milk producers and but few manufacturers; that while we as an

[1] References in this brief are to the preliminary prints.

›n represent a comparatively few organizations directly we do represent directly, through the indorsement of the associations, not only cream dealers of New and but the Boston and Suburban Milk Dealers' Association and the New Eng- Ice Cream Dealers' Association, and indirectly, we speak for a consuming public ›proximately seven and a half million in New England. For these reasons we ›et that it is unfair that the large number of people in poorer circumstances even the average farmer in New England should be compelled to pay any higher s than are necessary for milk and its products, which are the most necessary les of food and are particularly the food of infants and invalids. Being, moreover, rect touch with the consumer, we know what the producer perhaps fails to realize, there is a price limit at which consumption decreases, and that particularly regard to the sweet cream going into the manufacture of ice cream it has been s a fight to hold the market for sweet cream as opposed to sweet butter homoge- l, and that when cream rises above a fair price sweet butter is shipped from storage centers and displaces sweet cream, to the detriment not only of the a dealer but of the consumer and the producer as well. It may be noted here with the high butter market always comes the increased use of oleomargarine vegetable oils margarines.

NEW ENGLAND PROSPERITY.

plying to that portion of the brief of the National Milk Producers' Federation, 2593, and statements of Mr. George N. Putnam, page 2595, relative to decadence ›w England, as well as Tables 1, 1A, 2, 3, and 4, pages 2600 and 2601, the figures n are misleading without taking into account other factors reported in the same ›tins of the Bureau of the Census to which no reference has been made. The ving figures from Vermont, the most distinctively agricultural State in New and, and furnished by H. B. Ellinger, professor in animal and dairy industry, ersity of Vermont: "Approximate increase during the past 20 years: The census › for 1900 place the number of dairy cows at 270,194, total value at $7,740,908, ge value per cow at $28.65. In 1910 the total number of cows was placed at 83, total value $9,527,660, average value per cow $35.89, and in 1920 the total ber of cows was placed at 290,122, total value $23,027,209, and the average value ow at $79.37. The assessor's figures as reported in the annual report of the com- oner of agriculture for 1915 gives 223,911 cows and for 1920 gives 244,126 cows."

ble 1, hereto annexed, is compiled from table 1 of the Agricultural Bulletins of Bureau of Census for each of the New England States, showing the comparative e of live stock, implements and machinery, buildings, land, and all farm property, her with average value per farm for the same items taken as of 1910 and 1920. r show increases in value of all farm property as follows: Maine, 35.8 per cent; Hampshire, 14.8 per cent; Vermont, 53.2 per cent; Massachusetts, 32.7 per cent; ›ecticut, 42.4 per cent; while even Rhode Island shows a small increase. The es of the live stock on the farms have increased as follows: Maine, 58.1 per cent; Hampshire, 60.9 per cent; Vermont, 87.2 per cent; Massachusetts, 61.6 per cent; de Island, 47.7 per cent; Connecticut, 65.7 per cent.

ble 2 is compiled from table 20 of the same set of bulletins, to point out the equities arms. These tables show that in Maine the total value of all farms in 1910 was 74,005. Those farms at that date were subject to mortgages of $11,738,529. ay the equity above all mortgages is $39,834,863, showing an actual net asset in and and buildings greater than the total of all valuations in 1910, including tgages. This statement is true of Vermont and Connecticut, and values of equi- have materially increased in all New England States. Any business man who ›sure his net assets as having largely increased bases that as the measure of his perity rather than the amount of his indebtedness.

he value of dairy products sold has practically doubled in all the States as shown Table 3.

Table 4 shows the increase in production of crops in the New England States, and mpiled from Table 32 of the same bulletin.

Table 5 shows the number of depositors and deposits in savings banks in each of New England States, there being a considerable increase in the number of deposi- and deposits in each State in the year 1919–20. Out of a total population of less than 7,500,000 there are over 4,000,000 depositors and almost $2,000,000,000 posits.

Table 6 shows the ratio of motor vehicles to the population and to the road mileage. Vermont the number of cars increased from 1918 to 1921 as follows: Passenger cars, 32 to 33,778; commercial cars, 1,873 to 3,487. (From records of the secretary of te of Vermont.)

These various tables are submitted as reliable facts to show the inconsistency of th- statements made by the various witnesses and deduced from the partial statistic- submitted.

It is not our purpose to minimize the difficulties of the farmer. We realize that h- like the rest of the world, is suffering because of the past seven years upheaval. W- do not, however, believe the New England farmer has fully realized the relati- measure of prosperity which has come to New England agriculture.

Mr. Putnam, page 2957, part 35, Hearings on Tariff, states that the last three - four years have been the most unprofitable years in his experience in farming. Refer- ence to the market quotations in the years from 1906 to 1909 show prices rangin- from $0.30 down to $0.22 per pound for butter, while the rate for 1918, 1919, and 19- ran between $0.45 and $0.58; that the value of milk, placed at 12.9 cents per gallo- in the earlier period, or 3¼ cents per quart, increased to 6.65 cents in 1920; - - cream rose from 78.9 cents per gallon to $1.226 per gallon.

It is interesting to note that in the report of the special commission of Congre- first part, "The Agricultural Crisis and Its Causes," it is found that the purchasi- power of the farmer's dollar in terms of commodities, excepting food and farm prod- ucts, was 17 per cent higher in 1918 than in 1913, and that from 1913 to the presen- year his gain has been considerably greater than his loss, while, according to the la- statistical information, the purchasing power of the workingman's wage has be- - to 17 per cent less than before the upward movement of prices in 1916. We mu- further remember that of the seven-tenths of men and women engaged in gainful labor outside of those in agriculture about one-fourth are out of employment and a considerable number are living from hand to mouth on part time and reduced wage- For these reasons we ask consideration for the men and women who are the consum- of milk and its products. We ask nothing that will, in our opinion, prevent the farmer obtaining a reasonable profit on his dairy products, but we do seek to prevent a c- dition in which there will be a possibility of forcing extortionate prices from the co- sumer or compelling him to go without.

COMPARATIVE COSTS OF PRODUCTION IN CANADA AND UNITED STATES.

The basis of costs in Canada and the United States has been argued at great len- in the testimony of the producers and their briefs. We desire to call attention - the difference in statistics obtained by the United States departments and th- obtained by the producers' organizations, which are naturally biased and in spi- - an intention to be fair will almost inevitably favor their preconceived views. T- brief of the National Milk Producers' Association, page 2593, states, "The differe- between a protective tariff and a revenue tariff consists chiefly and almost wholl- in wages." Mr. Camburn, director of the division of dairy of Massachusetts depar- ment of agriculture, says that the difference lies primarily in the labor cost. Acce- ing their statement as correct, we call attention to certain facts and figures.

The Warren formula, page 2588, is used. It is difficult to understand why - basis is used instead of that which was most carefully worked out by the United Sta- Department of Agriculture for a two-year period on Vermont farms. It will be n- that the Warren formula shows the total amount of feed and labor. When it com- to a percentage of various factors of the whole, it gives a larger ratio for labor than it - entitled to, because the comparison of gross costs of labor is with net cost. For ex- ample, the credits for cows and manure, amounting to approximately 20 per c- return, is deducted from the overhead charges or costs, and the balance is added - the labor and feed costs to make 100 per cent. Thus, the factor of percentage for la- is high (approximately 29 per cent). This factor at the time of the United Sta- investigation in Vermont was given as 21 per cent. However, using each of t- methods, Mr. Camburn, page 2615, testified that the cost of butter production in Ne- England was 55 cents. By United States formula, 55 times 21 per cent equals $0.115- total labor cost per pound; Warren formula, 55 times 29 per cent equals $0.1595 to- labor cost per pound.

The brief of the New England Dairy Committee, 2635, gives New England Sta- wages as $52 to $57 per month and Quebec $40. Thus, it would appear that the diffe- ence on the highest price of labor in New England and Canada was $17, or 28.6 pe- cent of the highest New England wage. On this statement, using the United Sta- formula, .1155 times 28.6 equals .033, difference in costs; Warren formula, .1595 ti- 28.6 equals .045, difference in costs.

Using the labor costs in the preliminary report of the United States Milk Produce- Dairy Tariff Committee, page 2587, part 35, wages without board in the United Sta- were $74; in Canada, $68. The wages were 8.1 per cent lower. Using these figur- United States formula, .1155 times 8.1 per cent equals .009 plus; Warren formul-

1595 times 8.1 per cent equals .013 minus. Thus, allowing a range on the figure of he various briefs from .9 of a cent to 4.5 cents as the nearest approach to an accurate tatement of difference in labor costs per pound of butter, it does not reach one-half he 10-cent difference which is claimed and is more than covered by 5 cents duty.

Tables in the brief (p. 2634) show feed costs higher in Quebec. Further, we call ttention to the statement of Mr. Leach, pages 2610 and 2611, as to the character of oil and natural advantages of the New England dairy section. This is borne out by he New England Dairy Tariff Committee, part 29, page 2209, under the heading, Standards of Living," and by the Tariff Information and Surveys on Dairy Products, nited States Tariff Commission, page 10.

SUFFICIENCY OF UNITED STATES SUPPLY.

We call attention to figures, page 2588, showing that the United States produced fficient dairy products for needs of the market of the country. No one denies the ct that the United States products are sufficient to more than care for the home arket, but they have consistently sought the best market, and we have produced any times the amount consumed at home. This is shown by the fact that in the st 11 months of 1921, which has been heralded as a poor year for the dairy industry, d during which there has been serious disturbance of our export trade, we still ported in value more than double the amount of imports. (See Table 7.) We wish, wever, to call attention to one misleading figure in the table referred to. The tal production of milk is correctly given for the United States as 90,600,000,000 unds for the year 1919, but of that amount only about 45,000,000,000 was available r fluid milk, the remainder going into manufactured products which are listed low in the same table, apparently as additional production. The percentage in the n column on the first line in that item would be 89 per cent instead of 42.6 per cent. ain, during 11 months of 1919 the imports and exports of dairy products for the untry as given in November Summary of Foreign Commerce, Department of Comerce, were: Imports, $11,684,769; exports, $131,923,237. Thus, the world market ve an opening for a surplus, and that the products sought the highest levels is a r inference. (See Table 7.)

PRICE LEVEL.

One more question raised is that an increase in price levels justifies higher rate than s given under the Payne-Aldrich Act. Replying, we do not understand that it been the theory of the protective tariff that all commodities should be taxed on ad valorem basis or that specific duty should be made on a cost basis. Some ngs are placed on the free list, others made dutiable, and the difference in wage els has been really more important than the relative market price.

A product like milk and the various products made from milk should not be taxed as to levy a heavy burden on the consumer. Furthermore, because of the fact at in butter-fat products we are in competition with substitutes which can be duced at a much lower cost, we must recognize there is a limit at which protection ses to protect and encourages substitutes, and that as far as the production of enue is concerned becomes a point of diminishing returns.

It is perhaps natural that in statistics given in the course of testimony rather than briefs there are errors. We have not attempted to meet many of those, as, for mple, that on page 2598 relative to the amount of butter imported from Canada 1913, where the amount is given as 35,000 pounds instead of 351,242.

Regarding the sanitary production of milk on Canadian and New England farms, are compelled to ship cream into Boston under the strictest regulations and to ng it in at a given temperature. The Canadian producers are obliged to meet se conditions before cream is taken from their dairies.

Regarding the whole question of duties on dairy products, we submit herewith an n from the New York Produce and American Creamery under date of January 11, 1. We believe that this statement covers generally the industry and its needs. believe the rates fixed by H. R. 7456 are ample for butter and cream. We do not ieve that cream is in competition with butter so that the interests of the producer uire harmonizing of the tariff rates. If they were to be harmonized, the basis is that suggested by the producer but that suggested in brief of Cream Dealers Assotion of August 30. We suggest, if your committee deems wise, a different rate on h pasteurized cream imported for consumption as cream or ice cream from that our cream and cream imported for manufacture into butter. We do this in an est effort to meet the problem which seems most to disturb the producers. We

further invite fullest inquiry into the conditions under which we import cream and the facts stated in our briefs.

[From New York Produce and American Creamery.]

THAT "EXPORTABLE SURPLUS."

According to a press item issued from the office of the executive secretary of the National Milk Producers' Federation, Mr. R. W. Balderson stated at a recent hearing before the Senate Finance Committee, in a plea for a 10 cents a pound tariff on butter, that "the United States can supply with present production all the dairy products necessary for home consumption and still have an exportable surplus." At the same time he referred to the quantities of foreign butter recently coming into United States markets as evidence that "the emergency tariff rate of 6 cents a pound, * * * is no longer an effective bar to imports."

It is interesting to speculate upon the peculiar conception of trade conditions and price relations involved in these statements.

Of course, the relation of our dairy products, in volume, to the needs for dome[illegible] consumption is affected by domestic price levels. But if the "present production" at prices affected by the added supply due to importations on a 6 cents duty leaves [illegible] with an "exportable surplus," it would be interesting to know what becomes [illegible]. And it seems inevitable that with an "effective bar to imports" and a natural[illegible] higher level of prices in domestic markets our "exportable surplus" would be a good deal like the fellow (or was it a girl?) who was "all dressed up with no place to go."

Of course, if the Danish and Argentine and Antipodean butters now coming to [illegible] markets were barred out by a prohibitive duty we could hardly expect to find [illegible] foreign outlet for what Mr. Balderson calls our "exportable surplus," unless our butter prices should fall to an export relation to the world's markets, in which case a tariff, high or low, would be of no account or effect. If our butter prices are kept abo[illegible] parity with the world's markets by a high tariff, that result can only be realized [illegible] limiting production to domestic needs at that higher price level unless some mea[illegible] could be found by which butter manufacturers could limit their sales in dome[illegible] trade and sell abroad any surplus that might arise at a lower price than domestic con[illegible]sumers had to pay, just as the dairymen's combination arbitrarily fixes a price [illegible] market milk above the normal value of milk as a whole, and sells the surplu[illegible] manufacture of dairy products at a lower price.

There is no doubt that the shutting out of foreign butter from our markets by [illegible] tariff high enough to be, as Mr. Balderson says, "an effective bar to importation[illegible] will monopolize the domestic markets for the domestic production. But that [illegible] also limit our domestic production to the domestic needs, and we can have no "exp[illegible]able surplus" unless our butter manufacturers can make a surplus profitably at [illegible] low enough to compete abroad with the goods barred out of our own markets.

STATEMENT OF THEODORE P. GRANT, REPRESENTING THEODORE P. GRANT CO., BOSTON, MASS.

Senator WALSH. What is your business?

Mr. GRANT. Wholesale cream.

Senator WALSH. And you are located in Boston?

Mr. GRANT. I am located in Boston.

Senator WALSH. How extensive is your business?

Mr. GRANT. Last year we did about three-fourths of a million.

I do not propose to take a great deal of time, but I do want perhaps to emphasize one or two points. Mr. Parker's brief, I believe, gentlemen, if you will study it will give you some light on the subject that you have not had before. I have been engaged in the milk and cream business for about 20 years, and when we first started in the creamery business all our creameries were located along the line of the railroads. We took in milk from the farmers, separated it and gave them the skimmed milk back, and shipped the cream or butter to the market.

In Saturday or Sunday's Boston Herald is a little picture giving the way the milk market had changed in the last 20 years.

In 1900 they got all their milk for the Boston market from Massachusetts and a short distance up into the State of New Hampshire and nothing from Vermont; in 1910 they reached part way into Vermont and a little way into Maine, and in 1920 they covered the whole of Vermont, New Hampshire, and away down there into Maine and they had reached into New York State.

Your farmer is ambitious to sell milk on account of the more advantageous price as against butter. I do not think anybody will disagree with that.

Senator DILLINGHAM. There is a great difference of opinion in Vermont and a great contest among farmers as to which is the better way for them, part sticking to butter and part selling their milk.

Mr. GRANT. My experience as a creamery man, Senator, is that we have been absolutely forced away from all railroad shipping points for our supply of cream as a business.

As Mr. Parker has said, we are shipping the commercial cream that is absolutely necessary to-day; it is a necessity; it is not a luxury. A few years ago when I started in the business cream was a luxury. To-day at a wayfarer's lodge even the tramp who goes there and saws wood wants cream in his coffee, when before he would have been glad to get coffee with skimmed milk; everywhere you go you hear the cry for cream.

As this thing developed we had to go into Canada for our supply. I think that I was one of the first ones who took cream across the border into New England and at the same time was operating creameries there. To-day I do not operate any creameries, but we buy our supply in New England and in New York State and in Canada.

Senator WATSON. What is it you really want?

Mr. GRANT. What we want is this: We want to forget that [illegible] cents a gallon that the New England Milk Producers and the National Dairy Union Association are asking on cream, which would absolutely prohibit bringing in the cream and make us absolutely [illegible]

Senator WATSON. Do you want cream free?

Mr. GRANT. No; we do not. We supported the Fordney bill, because we believed that cream for commercial purposes should be taxed for some revenue. But when we come to tax it to prohibit imports, we do not see that we are doing the Government any good and it is certainly going to put some of us right out of business, because there is not cream enough in New England to go around under normal conditions, and when abnormal conditions come we are in a very serious condition.

Senator WALSH. Is there not a marked increase in dairy cattle in Massachusetts?

Mr. GRANT. I believe there is a marked increase, but I understand Vermont has not increased.

Senator LA FOLLETTE. That is probably due to the importation of milk and cream from Canada.

Senator WALSH. It is not a very large increase; it has increased very slightly.

Senator SMOOT. Do you want this 30 per cent butter fat increased to 40 per cent the same as Mr. Parker?

Mr. GRANT. Yes, sir.

Senator SMOOT. And you want the 5 cents a gallon to remain as it is?

Mr. GRANT. Yes, sir.

Senator SMOOT. And 1 cent a gallon on milk?

Mr. GRANT. We are not particularly interested in milk, but I believe that that is sufficient. We believe the amount which comes in is infinitesimal, and in this brief Mr. Parker has filed you will find dairy markets from 1913 on which included the cream.

Senator SMOOT. The Payne-Aldrich tariff of 1909 was 5 cents a gallon cream.

Mr. GRANT. Then cream was put on the free list under the Underwood Act.

Senator SMOOT. That is true.

Mr. GRANT. None of the dire calamities have happened that were feared in some of the arguments that have been made. We have had a higher butter market in Canada right along than many thought we would have. So that in eight years there have been only five or six months when it has been possible to import butter at a profit.

As regards harmonizing these prices: Part of these prices are harmonized on the other side; that is, to get market cream it must be pasteurized. We can not take raw cream across the line successfully, pasteurize it, and ship it to the market.

We must have it pasteurized there, and for that reason we are obliged to pay Canadian creameries a premium of from 1 to 3 cents a pound of butter—not butter fat in the content of a can of cream. And to bring that across it costs us for hauling and icing charges on every can that we get across the line about $1. In fact, my books will show that it has done that for the last three years.

Senator WALSH. So you prefer to get the cream in New England territory if you could to avoid that charge?

Mr. GRANT. If we could, yes.

Senator WALSH. Is the situation this: The demand for cream in the summer months is away beyond the supply that New England furnishes to the market?

Mr. GRANT. Yes, sir.

Senator WALSH. And in order to have that supply in the summer you must keep up some trade with the producers of cream in Canada?

Mr. GRANT. Absolutely.

Senator WATSON. What is the difference between the price of cream in Canada and in the New England States?

Mr. GRANT. Canadian creams cost us more since the 1st of January on the average than New England creams, on account of the fact that the Canadian butter market on which we buy——

Senator McCUMBER (interposing). It costs more where—in Canada?

Mr. GRANT. Delivered in Boston, and that is where we have to figure it; we can not figure it at the border.

Senator McCUMBER. What about the cost of transportation from Canada to Boston as compared with other New England points in the interior?

Mr. GRANT. That is all on mileage basis, Senator. On the railroad it costs, at about the cheapest rate we can get, on a can of cream to any point 50 to 55 cents, and from that to 60 and 75 cents.

Senator McCUMBER. That is in the United States?

Mr. GRANT. Yes.

Senator McCUMBER. What does it cost to bring it in from Canada, exclusive of the tariff?

Mr. GRANT. My Canadian cream costs about $1.50 for hauling, freight, and icing. We are dealing not with a cream to go into butter.

Senator McCUMBER. Does that include the tariff?

Mr. GRANT. That does not include anything except hauling and icing charges. My books will show that, and they will be open to the inspection of anybody representing this committee.

Senator DILLINGHAM. Do you know what amount of dairy products is produced in the Province of Quebec as compared with the whole amount produced in the Dominion of Canada?

Mr. GRANT. I do not. Mr. Parker's figures in his brief, I think, will show that.

Senator DILLINGHAM. My recollection is that Quebec produces about 75 per cent of the entire Canadian dairy products?

Mr. GRANT. I think so. But you can not go back more than 10 or 15 miles from the border to get this market cream. You have got to take what is made in there.

Senator DILLINGHAM. Coming back to this question of differentials. Take the question of butter; do you remember what the rate was under the existing law on butter coming into this country from Quebec?

Mr. GRANT. At the present time?

Senator DILLINGHAM. Yes.

Mr. GRANT. Six cents a pound.

Senator DILLINGHAM. Under the Underwood bill it was 2½. Do you know what the Canadian charges to the northern Vermont farmer were if we wanted to send our butter into Montreal?

Mr. GRANT. I do not know that.

Senator DILLINGHAM. I do not remember exactly; but my recollection is that it was 4 cents. I know there is a difference and that Canada charges more than we charge. What is the population of New England?

Mr. GRANT. Something over 7,000,000.

Senator DILLINGHAM. What is the whole population of Canada? n million, is it not? And we have that great market in New gland, which Quebec wants, of course, and Quebec is not so far tant but what under proper conditions freight rates can be paid. want to call your attention to those things and have you explain m in connection with the other statements you are making. Our rmont farmers pay taxes to support American institutions and y think they have a better right to the New England market than ebec has.

Mr. GRANT. And we are very glad to give it to them.

Senator DILLINGHAM. All along the New England border we have d men who have creameries in the United States. They are near border, and I have no doubt they would like to get the cream from nada, and I am willing that they should have it, but I want it to on fair rates, and I hope that you gentlemen in making your plea e to-day will be able to suggest some line upon which the two erests could agree as being fair and right; if your brief does that hall be very glad to study it.

Mr. GRANT. I think it does. I think I will bring that out also it we absolutely need market cream. The brief will show that I it telegrams and letters to a dozen or fifteen creameries in the States Vermont, New Hampshire, and New York—the points of large pply—and I was unable to get 50 gallons a day; I was not able to anything. I have the copies of the letters there, but I also have originals, and I will be glad to leave the originals if the copies ll not do.

Senator DILLINGHAM. It is your idea, is it, Mr. Grant, that the w England dairymen have specialized more either in butter or in lk and have not shipped so much cream; that is your claim, is it?

Mr. GRANT. Absolutely.

Senator DILLINGHAM. I do not know how far that is true.

Mr. GRANT. I have in the past operated creameries, and now I have t one on the line of a railroad. I do not operate any. But we do y in Franklin County in the wintertime, and from the Richmond eamery, and I can mention some others the Senator may know.

Senator DILLINGHAM. I know all of them.

Mr. GRANT. Those names are contained in the brief. And then I ve taken the matter up with the department of agriculture in assachusetts, who had been making a survey of the cream supply th the hopes of enlarging it, and they sent me a list of all the eameries they had gotten answers from as a possible source of pply. I wrote to every one of them, and I succeeded in getting one an who would sell me 50 gallons a day. I was looking for 250 to 0 gallons, and I would have guaranteed to have bought for three onths, and that probably meant continuing right through the year. Our solution of this problem is this: It has come to me within the st 48 hours—and I think Mr. Parker has figured part of it in his ief—that this commercial cream up to 40 per cent butter fat, steurized cream for market use, should be taxed 5 cents per gallon. ow, that 5 cents per gallon represents what? It represents 1¼ to cents per pound on the butter content. We have to pay from to 2½ cents per pound premium above the Canadian butter market, hich makes about 4 cents per pound, to which add 3 to 4 cents per

pound of butter for hauling, icing, and freight charges, and the duty is already more than harmonized with the present duty on butter.

If we can get a rate on commercial cream, pasteurized in Canada, at 5 or 6 cents a gallon up to 40 per cent, and then tax the cream coming in sour or sweet for manufacturing into butter at 10 cents or any rate that is right, we are right with it. I believe it will solve the problem and take care of all this bugaboo that is continually coming up about the possibility of flooding the land with cream along the line and making it into butter. That has never been practiced successfully; it was practiced in 1910; along the border as soon as the Payne-Aldrich law went into effect 9 or 10 of these Canadians came across and established factories along the border in New York State; they built creameries and started in to the manufacture of butter, and they all went broke when the butter panic came in the spring of 1911, and there are none of them there that I know of. There is some butter made, but it is an infinitesimally small amount.

Senator WALSH. If cream came in free from Canada, you would prefer to buy it from Vermont and New Hampshire?

Mr. GRANT. We prefer it at all times.

Senator WALSH. Would it be cheaper for you?

Mr. GRANT. There is not a great deal of difference between the cost of a gallon of cream in Canada and the cost of cream in New England at any time, as an analysis of our butter markets will show from 1913 to 1921. We have them right up to date in this brief, and they will show. To some of them we have added on the Payne-Aldrich tariff and the present emergency tariff, and they will show the Canadian butter market, the basis on which cream is bought, is frequently higher than our own; and in that case you can not bring the cream in and manufacture butter to compete with our own goods.

We have been at the business 12 or 13 years, and I know it is an impracticable proposition, and I know there is absolutely no danger to the farmers of the country. I believe that if we can have it arranged so that we can have 5 cents duty on market cream—and bear in mind, again, we pay a premium on the Canadian side of the line in order to have them manufacture it—we would be taking a step in the right direction.

Senator DILLINGHAM. May I inquire whether the other side of the question has made application for hearing?

Mr. Stewart will know, I think.

Senator SMOOT. There is a long list of them.

Senator MCCUMBER. What was the question, Senator?

Senator DILLINGHAM. I asked whether the farmers or those representing the farmers of New England had asked to be heard on this question. They are coming later, I understand. But bearing on this, I will ask to have put into the record a brief sent to me by the New England Tariff Committee on certain dairy products, which appears to have been prepared by W. H. Bronson, statistician, New England Milk Producers' Association; O. M. Camburn, director of dairying, Massachusetts Department of Agriculture; and G. C. White, professor of dairy husbandry, Connecticut Agricultural College.

Senator MCCUMBER. That may be done.

DAIRY PRODUCTS.

[Paragraphs 707–710 and 1598.]

TATEMENT OF CHARLES W. HOLMAN, WASHINGTON, D. C., REPRESENTING NATIONAL MILK PRODUCERS' FEDERATION.

Mr. HOLMAN. My name is Charles W. Holman, and I am acting ecretary of the National Milk Producers' Federation.

I am filing, Mr. Chairman, a list of our member associations, which a collection of cooperative corporations exclusive of farmer memership, representing, in the aggregate, 21 associations and something ver 200,000 farmer members.

MEMBERS OF NATIONAL MILK PRODUCERS' FEDERATION.

Dairymen's League (Inc.) and Dairymen's League Cooperative Association (Inc.), tica. N. Y.
New England Milk Producers' Association, Boston, Mass.
Inter-State Milk Producers' Association, Philadelphia, Pa.
Maryland State Dairymen's Association, Baltimore, Md.
Maryland and Virginia Milk Producers' Association, Washington, D. C.
East Tennessee Milk Producers' Association, Knoxville, Tenn.
Oregon Dairymen's Cooperative League, Portland, Oreg.
Kentucky & Indiana Dairies Co., Louisville, Ky.
Queen City Milk Producers' Association, Cincinnati, Ohio.
Ohio Farmers' Cooperative Milk Co., Cleveland, Ohio.
Dairymen's Cooperative Sales Co., Pittsburgh, Pa.
Northwestern Cooperative Sales Co., Wauseon, Ohio.
Michigan Milk Producers' Association, Detroit, Mich.
outhern Illinois Milk Producers' Association, St. Louis, Mo.
Twin City Milk Producers' Association, St. Paul, Minn.
The Milk Producers' Association and the Producers' Cooperative Marketing Co. of Chicago District, Chicago, Ill.
Milwaukee Milk Producers' Association, Milwaukee, Wis.
ouisiana and Mississippi Dairymen's Cooperative Association, New Orleans, La.
ssociated Dairymen of California, San Francisco, Calif.
nited Dairy Association of Washington, Spokane, Wash.

I am also filing a list of our officers and directors, Mr. Chairman

OFFICERS AND DIRECTORS OF THE NATIONAL MILK PRODUCERS' FEDERATION.

Milo D. Campbell, president.
R. D. Cooper, first vice president.
H. W. Ingersoll, second vice president.
F. P. Willits, treasurer.
eorge Brown, secretary.
has. W. Holman, acting secretary.
oard of directors: Milo D. Campbell, Coldwater, Mich.; R. D. Cooper, Little s, N. Y.; H. W. Ingersoll, Elyria, Ohio; George Brown, Sycamore, Ill.; G. R. , Milwaukee, Wis.; W. F. Schilling, Northfield, Minn.; H. W. Tinkham, Warren, ., W. J. Kittle, Crystal Lake, Ill.; J. D. Miller, Susquehanna, Pa.; F. P. Willits, l Pa.; R. C. Reed, Howell, Mich.; Harry Hartke, Covington, Ky.; J. M. lerson, Sacramento, Calif.; P. S. Brenneman, Jefferson, Ohio; Richard Pattee, ton Highlands, Mass.; J. A. Scollard, Chehalis, Wash.; Alma D. Katz, Portland, g. F. T. Holt, Kenosha, Wis.; H. J. Schultz, Shipman, Ill.; D. G. Harry, Pyles-, Md.; J. Wood Yager, La Grange, Ky.
xecutive committee: Milo D. Campbell, R. D. Cooper, H. W. Ingersoll, W. J. tle, J. D. Miller; alternates, Harry Hartke and R. C. Reed.

n order to expedite the dairy discussion before this committee, the ducers' organizations and some of the creamery men have agreed divide up the time among themselves and to present sectional uments.

Cost of producing 100 pounds of milk, "Warren formula."

Item.	Quantity.	Price per ton or hour.	[illegible]
Grain...pounds..	33.29	$38.50	[illegible]
Hay...do....	43.3	16.00	[illegible]
Other dry forage...do....	10.8	8.00	[illegible]
Silage...do....	92.2	8.00	[illegible]
Other succulents...do....	8.3	8.00	[illegible]
Labor...hours..	3.02	.28	[illegible]
Total, representing 79 per cent of cost...	....	....	[illegible]
Final cost, including overhead...	....	....	[illegible]

BASIS OF COSTS OF MILK PRODUCTION IN THE VARIOUS SECTIONS.

New England: The New England costs of milk production are based upon the "Warren formula," which was developed by Dr. G. F. Warren, of Cornell University, who was a member of Hoover's milk commission, and which was used by regional Federal milk boards in determining the cost of milk production during the war period. The "Warren formula" gives the quantities of feed and labor required to make 100 pounds of milk. To these quantities have been applied new feed and labor prices as of April to bring such costs up to date.

New York: New York cost is based upon the "Warren formula," from figures furnished by Dr. G. F. Warren, of Cornell University as of May, 1921.

Philadelphia: Philadelphia costs are from the New Jersey State Experiment Station, comprising a study made of the cost of production of milk on 65 farms in the large milk-producing sections of New Jersey for May, 1921, and checked with the records of over 4,000 cows in cow-testing associations in Pennsylvania and a recent survey of the cost of milk production made by the United States Department of Agriculture in Delaware.

Baltimore: Baltimore costs were obtained from a survey of 94 farms in Maryland which was conducted by the United States Department of Agriculture in 1920, such costs brought up to date as of May by introduction of new labor and feed costs.

Ohio: Ohio costs were obtained from 42 cow-testing associations, which have records extending over a period of seven years with a total of over 21,000 cows, also including the milk-cost associations which have been operating for the past few years under the supervision of the Ohio State University. These costs in each case have been brought up to date by the substitution of new feed and labor costs.

Chicago: Chicago costs are based on the modified "Pearson formula," which was used by the Chicago Federal milk board appointed by Hoover during the war period to determine costs of milk production, with the figures brought up to date by applying recent feed and labor costs.

California: California costs are based on figures from the records of the dairymen of California for May, 1921, as furnished by the Associated Dairymen of California [illegible]

Compared with these costs, the costs in Quebec, Canada, in April were [illegible] hundred for 3.5 per cent milk, a difference as compared with New England of [illegible] per hundred in favor of Quebec, or 4.1 cents per gallon, and with the United States [illegible] 43 cents per hundred or 3.7 cents per gallon. The costs in Quebec, Canada [illegible] obtained by an actual survey in territory shipping milk and cream to Boston.

Based on these costs of milk production, the cost of producing 1 gallon of [illegible] cent cream is 40 cents per gallon less in Quebec than in New England, and [illegible] per gallon less in Quebec as compared with the United States.

Canada and Denmark: Based on these costs of 100 pounds of milk, the cost [illegible] ducing 1 pound of butter is 10 cents less in Canada than in New England and [illegible] United States. The cost of producing 1 pound of butter in Denmark, as stated by Mr. Harold Faber, agricultural commissioner for Denmark, for 1920 was 40 [illegible] pound, and as stated by Mr. O. H. Larsen, professor of agricultural economics [illegible] Royal Agricultural College, Denmark, was 45 cents per pound. As compared [illegible] the cost of producing 1 pound of butter in the United States of 59 cents and [illegible] New England States of 55 cents, this gives the advantage to the Danish producer from 15 to 19 cents, with the cost of transportation only 2½ cents per pound to New York.

Other foreign countries: It has been impossible to obtain production costs of [illegible] products in other foreign countries than Denmark, but the following tabulation [illegible]

bor rates in the United States and foreign countries, as reported from Government urces, indicates that production costs in other foreign countries than Denmark are nsiderably lower than United States production costs.

Farm wages in United States compared with foreign countries in 1920.

Country.	Farm wages without board.	Difference.	Per cent of difference.

TRANSPORTATION CHARGES.

A study of transportation costs from Denmark to New York as compared with transrtation costs from Minnesota and Wisconsin to New York shows that butter can be ded in that market as cheaply from Denmark as from the Middle West States, the st of transportation in each case being approximately 2½ cents per pound, and nsportation costs from the extreme West give a decided advantage to the foreign oducer. (Transportation charges in respect to milk and cream, considered priarily from a New England and New York State standpoint: The transportation arges for milk from the center of production in New England compared with the nter of production in Quebec favor the New England producer by 6 mills per gallon. milar costs of transportation on cream show that the transportation costs favor the w England producer by the same amount. The cost of transportation of a pound of tter from the New England center of production to Boston as compared with the sts from Quebec center of production is three-tenths of a mill less.)

SPECIFIC DUTY DESIRABLE.

From an administrative standpoint it is believed that a specific duty on dairy oducts is more desirable than an ad valorem duty.

CHANGE IN PRICE LEVEL MAKES HIGHER DUTY NECESSARY.

In 1897, when butter sold for 20 cents per pound, a duty of 6 cents per pound was opted. At the present price level of butter, which will average from 30 to 40 cents r the year, a duty of at least 10 cents per pound is necessary to give the same protion.

A study of the United States production and consumption of dairy products shows at enough are produced here to meet all demands without any imports.

UNITED STATES, 1919.

[From the Market Reporter, June, 1920.]

Item.	Production.	Consumption.	Ratio of consumption to total produced.
	Pounds.	*Pounds.*	*Per cent.*
[illegible]	90,600,000,000	38,619,000,000	42.6
[illegible]	1,560,000,000	1,530,000,000	91.7
[illegible]	420,000,000	404,000,000	96.2
[illegible]ed milk	1,925,000,000	1,217,000,000	63.2

In 1919, 416,000 gallons of cream were shipped from Canadian points to Bos
The butter produced by New England creameries would have provided four and a ha
million gallons of 36 per cent cream, or eleven times the amount necessary to replace th
Canadian shipments. The butter production in New England would have suppli
nine times the amount needed to replace Canadian cream shipments to Boston for th
month of heaviest shipment (June).

BALANCE OF TRADE ON BUTTER.

The Market Reporter, published by the United States Department of Agricultu
for February 26, 1921, shows that we have changed from a net exporting coun
in 1919, when we exported an equivalent of 500,000,000 pounds of milk, to a n
importing country in 1920, when we imported what would be equivalent to ov
400,000,000 pounds. The butter imports from Canada have increased from 35
pounds in 1913 to over 9,000,000 pounds in 1920. This has resulted in an oversup
of dairy products, which has resulted in a demoralized market and a selling pr
lower than the cost of production.

In order to maintain the standard of living on American farms and meet th
difference in costs of production of dairy products in this country and foreign co
tries, adequate protective tariff is necessary.

IMPORTATION OF VEGETABLE OILS A MENACE TO THE DAIRY INDUSTRY.

The dairy industry demands a tariff on vegetable oils equal to the tariff on b
for which it is used as a substitute. The wholesale price of vegetable oils is usu
about 25 per cent of the wholesale price of butter, yet butter substitutes usu
sell for 75 per cent of the price of butter. The importation of vegetable oils u
largely in the production of substitutes for butter and other milk products incre
from 82,000,000 pounds in 1912 to over 435,000,000 in 1920. This importation in 1
replaced the butter-fat production of over a million cows, or 7 per cent of the to
number of cows in the United States. This has been an important factor in cau
losses to dairymen, and it may have damaged materially the health of the Nat

IMPORTANCE OF DAIRY PRODUCTS TO THE NATION.

Eminent scientists and health authorities now recognize milk and its produc
absolutely essential to the life of the Nation, because they promote growth, healt
reproduction, and longevity, and at the same time are the most nourishing a
cheapest form of animal foods. Therefore, the Nation must give the dairy far
protection which is as effective as that applied to other industries.

Mr. HOLMAN. Following that report, the farm organizations rep
resented here in Washington have held a number of meetings a
which they have discussed the dairy tariff schedules and oth
schedules, and they have come to some agreement among themselv
in order to get unified support of the changes which I am offeri
for the record this morning. I will not read the changes, as th
witnesses who will follow me will discuss it very carefully by para
graph, and it will save your time.

I also wish to file a special brief by the Associated Dairym
(Inc.), California, one of our member associations, in regard to cas
and milk sugar, and to file an introductory statement of Pre
dent Milo D. Campbell, president of the National Milk Produc
Federation.

Senator WATSON. Any brief that you desire to file and any witn
desires to file will be received for the record.

Mr. HOLMAN. Detailed briefs will be filed by the various memb
who will follow me.

In closing, I wish to emphasize this point, gentlemen of the com
mittee, that it is the producer who is most vitally interested in th
protective tariff on dairy products at the present time, because he
the one whose price is made the first base on which the later ope
tions are made.

Subsequently, the arguments which we will present before you are based primarily upon the need of our farmers.

I wish to thank you, and state our other members will follow in order.

BRIEF OF THE ASSOCIATED DAIRYMEN (INC.), OF SAN FRANCISCO, CALIF.

Casein and milk sugar should be placed on the dutiable list at the rate of 4½ cents per pound.

A duty on both casein and milk sugar is necessary for the protection of the dairy industry. While they may be regarded as secondary products, they, of course, have direct bearing on the value of milk.

If the United States requirements for casein and milk sugar are supplied from other countries, the value of milk in this country will inevitably be reduced proportionately. Furthermore, casein and milk-sugar production has not been fully developed in the United States because of foreign competition. As important war materials, the production has been greatly stimulated during recent years. These industries, however, will be reduced to their former status without protection being given.

It should be remembered that the water rates on casein from South America and Europe to New York are less than rates by water on casein and milk sugar from San Francisco to New York. It should be remembered that California is an important producer both of casein and sugar of milk.

To place casein and milk sugar on the free list, with a protective tariff on other dairy products, places these products in a worse position than they are in at the present time, because it offers a special opportunity for dairy products to come in in this form.

Considering these facts, it would seem only fair that casein and milk sugar be put on the dutiable list at rates in keeping with the rates proposed for other milk products. Such rates of duty should provide as much protection for 100 pounds of skim milk when made into casein and milk sugar as when made into skim-milk powder.

Approximately 6 pounds of casein and milk sugar (about 3 pounds of each) is obtained from 100 pounds of skim milk, while approximately 9 pounds of skim-milk powder is obtainable from the same quantity of skim milk. It would seem only fair, therefore, that the per pound duty on casein and milk sugar should each be one and one-half times the rate on skim-milk powder.

CREAM AND SKIM-MILK POWDER RATES TOO LOW.

The dairy products schedule contained in H. R. 7456 when applied to the different products resulting from 100 pounds of 4 per cent milk shows a wide variation in the protection afforded, as shown in the following table:

Approximate rates on the different products from 100 pounds of 4 per cent milk.

Product.	Proposed by H. R. 7456.	Equivalent in terms of milk.
...h milk	1 cent per gallon	12 cents per 100 pounds.
...r milk, buttermilk	½ cent per gallon	6 cents per 100 pounds.
...am, 29 per cent fat	5 cents per gallon	8.6 cents per 100 pounds milk.
...weetened evaporated milk	1 cent per pound	43.6 cents per 100 pounds milk.
...etened condensed milk	1½ cents per pound	28 cents per 100 pounds milk.
...le-milk powder	3 cents per pound	39 cents per 100 pounds milk.
...m-milk powder	1½ cents per pound	13.5 cents per 100 pounds milk.
...ter	8 cents per pound	40 cents per 100 pounds milk.
...se at less than 30 cents per pound	5 cents per pound	50 cents per 100 pounds milk.
...in	Free	No protection.
...k sugar	do	Do.

From the above it will be noted that there is a serious lack of uniformity in the rates proposed; but on the better-known products, such as butter, cheese, and evaporated (unsweetened) milk, the duty is equivalent to from 40 to 50 cents per hundred pounds on milk used in their manufacture.

No doubt it was considered that fluid whole milk and buttermilk would require little protection, since they could not come in large quantities in any event. Such, however, does not apply to other products that are seriously out of line.

It will be seen from the above table that the protection on the butter from 100 pounds of milk is 40 cents, while on butter fat, in the form of cream from the same

quantity of milk, it is only 8.6 cents. With the present methods of pasteurization and refrigeration cream can readily come in from Canada, and with particularly attractive markets might very well be expected to come from New Zealand, South America, and Denmark as well.

Referring again to the table, it will be noticed that the combined protection afforded to skim-milk powder and butter fat (in the form of cream) that may be secured from 100 pounds of milk is only 22.1 cents, while the same quantity of milk converted into cheese would give protection of 50 cents; into butter, 40 cents; into whole-milk powder, 39 cents; into unsweetened evaporated milk, 43.6 cents; into sweetened condensed milk, 28 cents.

Skim-milk powder is certainly as importable as any other product. Moreover, its production is one of the newest of our dairy industries. The development of the skim-milk powder industry in the United States must certainly be recognized as a matter of importance, not only to the dairy industry but to the Nation as a whole. It is only fair, therefore, that skim-milk powder be given at least as much protection as the older and well-established dairy industries are accorded.

In order that this be done, the rate on skim-milk powder in H. R. 7456 should be raised from 1½ cents to 3 cents per pound.

It is obvious that these rates should be raised in order that all protection afforded by the dairy schedule may apply with uniformity upon all products; and it is equally obvious that casein and milk sugar should for the same reason be placed on the dutiable list, each at 4½ cents per pound.

It is a matter of plain justice that the rate on skim-milk powder and cream (butter fat) combined should at least be equal to the rates on evaporated whole milk, whole-milk powder, or even cheese or butter.

It must be recognized that it is equally just that the combined tariffs on casein and milk sugar should be equal to the rate on skim-milk powder.

It must be remembered that in a modern milk plant milk is to all intents and purposes a raw material which can be converted into one product or another to meet market demands. To protect butter, therefore, and to allow cream to come in practically free will defeat the very purpose of the tariff. Moreover, to place a high protection on butter, cheese, evaporated milk, and condensed milk, and a low degree of protection on skim-milk powder, or on casein and milk sugar, will attract the greatest possible imports of the latter products and thereby reduce the real protection for the owners of the modern milk manufacturing plants. The absolute omission of casein and milk sugar from the dutiable list will still further contract the field of operations for the milk plants.

We trust that these considerations will have careful consideration and approval.

IMPORTS, PRICES, AND DOMESTIC PRODUCTION OF CASEIN (LACTARENE).

Importation of casein.—The importations of casein (lactarene) into the United States has increased from 9,000,000 pounds in 1913 to over 21,000,000 in 1920, as follows:

Imports of casein (lactarene), by years.

[Report Foreign and Domestic Commerce.]

	Pounds.		Pounds.
1913	8,805,000	1917	12,31[illegible]
1914	10,798,000	1918	7,0[illegible]
1915	7,920,000	1919	17,2[illegible]
1916	10,376,000	1920	21,2[illegible]

Over 17,000,000 of the 21,000,000 pounds of casein which was imported in 1920 came from Argentina, as shown by the following:

Imports of casein (lactarene) by countries, 1920.

[Report Foreign and Domestic Commerce.]

	Pounds.		Pounds.
France	368,000	Japan	[illegible]
England	2,257,000	Australia	[illegible]
Argentina	17,300,000	New Zealand	[illegible]
Brazil	201,000		
British India	250,000	Total	21,23[illegible]

Casein prices.—As a result of these very large importations of casein the price to he manufacturer of casein has gone so low that it now pays no more than the cost of nanufacture and returns no value for the skim milk used in its production. This as cut off an important market for skimmed milk. It is an economic waste not to se this skimmed milk to replace foreign casein. The following shows the prices eceived for casein by one New England producer of the product:

Casein prices, per pound.

Domestic production of casein.—The United States Department of Agriculture, reau of Markets, reports the domestic production of casein or lactarene as follows:

	Pounds.
18	10,935,000
19	13,685,000
20	11,526,000

IEF OF MILO D. CAMPBELL, COLDWATER, MICH., REPRESENTING THE NATIONAL MILK PRODUCERS' FEDERATION.

Permit me in behalf of over 200,000 members of the National Milk Producers' Federation to file with you the following general statement:

We ask that you first consider that we come to you as milk producers, farmers, d not as manufacturers.

There are 4,000,000 milk producers in the country and but comparatively few nufacturers of dairy products.

Wherein our demands for tariff rates may differ, if they shall, we want you to bear mind that manufacturers who live and prosper upon margins, the value of whose ducts is more than 85 per cent the whole milk or cream bought of the farmers, have right to disregard the needs of the real producers of dairy products.

We come to the committee asking no special favors in the way of protections not ted to other deserving industries.

We have no apprehension that there will be any discrimination between schedules ecting the farmer and those affecting manufacturers, nor have we any present reason doubt the purpose of the committee; but, should there be any attempt to trade the mer for foreign markets, to place upon the free list or near free lists his products, gain trade for protected industries, the same will not be patiently tolerated by riculture.

The specific rates asked by the milk producers of the country upon their various ducts will be presented to your committee by experts, and we ask that they be cted. I am here but mentioning a few basic reasons why they should be enacted o law, along with other protective tariffs upon farm products.

The difference between a protective tariff and a revenue tariff consists chiefly and most wholly in wages. I want to invite the attention of the committee to this most portant question, as it affects the farmer and particularly the dairy farmer at this

FARM EARNINGS—WAGES.

The total production of the farms of this country for the year 1921 will not ex[illegible] $10,000,000,000.

This sum includes all produce of every kind and description including live st[illegible] whether sold or consumed on the farms by the farmers themselves.

This estimate is probably about $2,000,000,000 too high, owing to the rapid drop [illegible] prices during the last few months.

Before the farmer can count a labor wage for himself, he must make from the ab[illegible] amount some deductions.

1. The last census fixed the value of his land, covering 6,459,000 farms [illegible] $54,903,000,000, his implements and machinery at $3,595,000,000, his live stock [illegible] $7,996,000,000, and his buildings at $11,430,000,000. We exclude farmhouses fr[illegible] the last item, because used as a residence should be offset against him. We therefo[illegible] divide the buildings amount by 2, calling it $5,760,000,000. We thus have a [illegible] investment other than for residences, of $72,250,000,000.

Let us first allow the farmer a meager 6 per cent upon his total investment [illegible] $4,335,000,000.

Allow him depreciation and repairs upon his buildings, fences, farm machinery [illegible] equipment, losses through sickness and accident to his live stock, depletion of [illegible] etc.

A very moderate estimate must place this at 6 per cent upon his valuation [illegible] another $4,335,000,000.

His insurance and taxes, State and local, will exceed $1,500,000,000.

These allowances to the farmer will total $10,170,000,000 or $170,000,000 more th[illegible] the total value of every crop raised from field and orchard, including all live st[illegible] sold.

This does not leave a dollar of wage for the 12,000,000 men employed upon th[illegible] farms of the country, not a dollar for the support of the 40,000,000 people living [illegible] in the rural districts.

Of course, this statement will be at once challenged as to accuracy by the unthi[illegible] ing, because the farmer must and does exist somehow.

He lives, however, because he gets nothing upon investment and because [illegible] allowing his farm, his buildings, and farm equipment to go without repairs or renew[illegible]

There are no new fences, no freshly painted farm buildings, no new farmho[illegible] and but absolutely indispensable farm machinery is purchased.

He can not escape taxes, insurance, mortgage indebtedness, etc. But to mak[illegible] concrete the conditions existing let us divide by 12,000,000 (the number of [illegible] farm workers) an estimated possible $5,000,000,000 remaining after taxes, insuran[illegible] and necessary property expenses are met.

We would have for each man per year for wages $416, upon which himself a[illegible] family must subsist, and upon which three and a third persons must live.

This does not account for any earnings for the millions of women and older childr[illegible] who work in the fields, care for stock, milk cows, and do other farm work.

With no allowance for investment, the farmers of this country are not rec[illegible] this year a dollar a day for their labor.

MANUFACTURING INDUSTRIES.

Upon the other hand, let us take a look at manufacturing industries. It is [illegible] known that profits are at a low ebb and that enterprise is lagging everywhere.

But statistics prove the contention we make, that agriculture must not be discri[illegible] nated against or traded in this tariff bill, if justice is to mark its course.

There are 289,768 factories reported, with 9,103,000 wage earners employed the[illegible]

Their capitalization is $44,500,000,000, and their products last year amounted [illegible] $63,000,000,000.

If we should make the same allowances that we did for the farmer, credit the ow[illegible] 6 per cent for their investment and all other items a like consideration, we would [illegible] an earning for labor amounting to more than $5,000 for each man per year. It mu[illegible] admitted that in the grand total of $63,000,000,000 manufactured products mu[illegible] some pyramiding of figures, but not excessive.

Chicago alone claims to have manufactured products valued last year at $[illegible] 000,000.

We need not carry this analogy further, for we have no desire to arouse class an[illegible] nism, nor are we opposing a fair wage to American labor.

FOREIGN TRADE.

We do not place the importance upon foreign trade to our industries that is being ...d by the manufacturing industries upon Congress.

During normal times more than 90 per cent of our farm and manufactured products ... sold at home in the home market.

The cause of our business paralysis at this time is not because of lessened foreign ...de, it is because of the utter impossibility of the farmers of the country to buy, ...consume their part of the 90 per cent from the factories of the country usually ...orbed at home.

The 35,000,000 people on the farms of this country are consumers of manufactured ...ff equal to the consumption of any other 60,000,000 of our population.

They buy not alone for their personal needs, but for the equipment and manage...nt of 6,459,000 farms.

This home market has been paralyzed during the past few months because of the ...r price of farm produce, and it is that paralysis that has closed the factories of the ...ntry.

Had farmers received for their labor and products of the farm the seven or eight ...lions of dollars shrinkage suffered in a single year all the business would have been ...rmal.

The economic circle would not have been broken. Seven billion dollars of money ...es our banks $50,000,000,000 resources and unnumbered billions of clearances. ...f, through a low tariff upon farm products, this home market shall be destroyed ...eriously weakened, no foreign market can ever take its place.

EUROPEAN TRADE.

The low wages paid in the former manufacturing countries of Europe will for many ...s prove almost prohibitive competition to American manufacturers in their re...tive countries. If we shall be successful in protecting our own people against ...ir competition in the United States we will have done much for the laboring men ...America, whether such labor be in the factory or upon the farm.

SOUTH AMERICA.

...s farmers we have heard the plea for the South American trade and that of other ...thern Hemisphere countries. But with that plea we hear the corollary, that if we ...l to them we must buy of them. That the ship that carries our manufactured goods ...them must be loaded with their goods for sale to us upon its return.

...s farmers, we are asking "with what commodities are such ships to be loaded?" ...at have they to sell but just such food and farm stuff as that produced by our ...erican farmers?

We are not numerously in Washington, the Nation's market place, at this time, ...ause we can not afford the expense; but we are intensely interested in our fate. ...have confidence that the Congress and its committees will accord to us fair treat...nt, but we have no confidence in those who would sell us to the Egyptians. We ...not be fooled by the voice of Jacob and the hand of Esau, nor do we believe that ...gress can thus be deceived.

THE DAIRY BUSINESS IN JEOPARDY.

...shall not enter the special fields to be covered by experts in various branches of ...dairy industry. We are just coming to know the value to the human family that ...k as a food has proven to be. The people I represent furnish one-fifth of the food ...ply of the Nation and the most essential food that is known. We are to-day pro...ing more than 45,000,000,000 quarts of milk per year and receiving for it an average ...ss than 3 cents per quart.

We do not array ourselves against good wages for labor anywhere, but we do want ...have our condition as dairymen known. If the farmers were to drive their cows ...the doors of our laboring men in other callings, offering them all the milk the cows ...duce for the mere act of milking the same, they would not perform that labor at ...prices received by the farmer. The milking of the cows is but one-fifth the cost ...the farmer of the milk the cows produce.

Time does not permit a discussion of all the bearings the tariff offers to a relief of ...ry farmers at the present time. But we do ask a duty upon milk and milk prod...s; and a duty upon vegetable and other cheap oils and fats now being made into

so-called substitutes for milk products high enough to protect our honest dairymen in their most essential field of toil, such as will be presented by our member organizations who follow.

LETTER AND RESOLUTION OF THE COOS COUNTY FARM BUREAU.

LANCASTER, N. H., *November 16, 192*[illegible]

NEW ENGLAND DAIRY TARIFF COMMITTEE,
Boston, Mass.

GENTLEMEN: In presenting the brief opposing the present tariff provisions on butter, cream, and milk to the members of the Coos County Farm Bureau, assembled in annual session, November 14, 1921, at the courthouse, Lancaster, N. H., the proposition aroused the interest of several dairymen, former residents of Canada. Coos County is located along the Canadian border, and, consequently, the influence of importations of milk, cream, and butter from Canada is felt from personal knowledge and observation. Combined with this fact, several farmers at the present time in the county are recent immigrants from Canada. These men have a definite knowledge of the American and Canadian conditions relative to producing and marketing milk and milk products. After introducing the brief to the meeting a recent Canadian resident took the floor and made the statement that 3½ cents a gallon on milk with proportional tariff regulations on other dairy products was not sufficient to check the importation of this product, nor was it sufficient to place the New England, and particularly the Coos County dairyman, on an equal basis with his neighbor in the dairy business in Canada. He further stated that from his knowledge of both countries 5 cents would be a meager sum in bringing about this equality, and it was through modesty that he asked for 5 cents. All felt it should be even more. His sentiment in the matter was more or less the prevailing one among Coos County producers that had recently come from Canada, and this fact influenced in a large measure the attitude which the committee on resolutions have taken in presenting the resolution which was finally adopted.

Am submitting this in connection with the resolution as a guide, and the reason why the resolution committee acted as they did in this matter.

Very truly, yours,

GEORGE H. NEVERS.
Farm Bureau Pres[illegible]

RESOLUTION.

The following is the resolution drawn up by the committee on resolutions at the Coos County Farm Bureau annual meeting, held November 14, 1921:

"*Be it resolved,* That it is the opinion of the Coos County Farm Bureau that the proposed tariff on dairy products, based on 3½ cents per gallon on whole milk is entirely inadequate to properly protect the dairy industry of Coos County.

"We recommend a tariff rate of at least 5 cents per gallon on whole milk, with other dairy products in proportion.

"*Be it resolved,* That a notice of this action be forwarded to our Congressmen and United States Senators at Washington, with the request that they not only support it by their vote, but that they use their influence in all ways to bring about its enactment as a part of the tariff legislation now pending."

STATEMENT OF GEORGE N. PUTNAM, PRESIDENT NEW HAMPSHIRE STATE FARM BUREAU FEDERATION, CONCORD, N. H.

Mr. PUTNAM. I represent the New Hampshire State Farm Bureau Federation, and also I desire to appear as a representative dairyman from New Hampshire, having been engaged in the dairy business all my life and am engaged in it at the present time.

I want to call briefly to the attention of your committee the conditions of the farm people and farming conditions of New England. I think the New England farmers are more largely engaged in dairying than in any other single line of agricultural pursuits, and the prosperity of New England agriculture depends very largely on the

rosperity of the dairy farmer. Dairy products are the one class of gricultural products which is produced in New England in large uantity to practically feed our people, and I want to call your ttention to a few things in connection with our farmers. I want to uote from the Fourteenth Census, which shows the figures consely. I will try to be as brief as possible and give you summaries ather than the situation from each State. I want to speak parcularly for New England as a whole, and also for my own State. he census shows this: That from 1910 to 1920 the number of farms ecreased materially in each New England State—in all New England from 188,802 to 156,564, or a decrease of 17 per cent as a whole. might be said by some that this decrease meant the combining of e smaller farms, but it is not true, as the figures show, because ong with the 17 per cent decrease of the number of farms in New ngland comes a decrease of 15.7 per cent in the cultivated acres.

In comparison with 1890 to 1900, which were normal times, the crease was only 1.6 per cent for that entire period; while from 1910 1920 it was 17 per cent. For instance, Maine's farms decreased 6 per cent; New Hampshire, 13.2 per cent; Vermont, 11.2 per cent; assachusetts, 11.5 per cent.

Senator WATSON. That means cultivated farms?

Mr. PUTNAM. Answering that, it means in actual farms as reported the census. For Rhode Island it was 12.9, and Connecticut 11.8 r cent.

Senator JONES. Have the farmers all gotten rich and gone into the y to enjoy their incomes?

Mr. PUTNAM. No, sir. You will find this in regard to the condins on the farms, and to my mind it is one of the reasons for the crease in the farms; in fact I know it to be true, because I have lived the farm on which I now live all my life. I was born there. When e boys grew up, other opportunities along other lines showed eater advantages to them, and they have simply left the farm and ne to the town, and as a result there are many instances in New gland along the roads for miles where the average age of the rmer is away above 50 years. I could cite an instance along a road New Hampshire on which I drove a few months ago, in a county me distance from my own, a distance of 2 miles there were just o farmers under 50 years of age.

Not only that, but farm after farm was unoccupied.

Senator WATSON. Has farming decreased but dairying increased?

Mr. PUTNAM. I think you will find this: That from 1909 to 1919, ile the production of milk in the country as a whole increased 18 r cent, in New England it decreased 2 per cent.

I want to call attention to statements showing the mortgaged ndition of the farms in the last 10 years. From 1910 to 1920 the rm mortgages in the State of Maine increased 58.4 per cent; in New mpshire they increased 42.9 per cent; in Vermont 89.6 per cent; in ssachusetts 42.8 per cent; in Rhode Island 10.2 per cent; in nnecticut 50.6 per cent.

I want to call your attention to the farms that were mortgaged in 90 to 1900, 1910 and 1920: In New Hampshire in 1890, 21.8 per nt of farms were mortgaged as reported; in 1900, 2.5 per cent; in 10, 25.6 per cent, and in 1920, 31 per cent; in Maine 22.1 per cent in

1890, 26.7 per cent in 1900, 26.8 per cent in 1910, and 29.8 per cent in 1920.

I am going to file this statement, as it applies to every New England State. In all New England States the number of farms that have been mortgaged have increased continually since 1890. While there was no large increase from 1890 to 1900 up to 1910, yet there has been a decided increase in the number of farms mortgaged in 1910.

Senator WATSON. Mr. Putnam, we are more or less familiar with those statistics. Could you come along to the dairy interests?

Senator SMOOT. Your general idea is that for years in this country the farmers have had the worst of the situation?

Mr. PUTNAM. For years; and for the last period of years in New England we have never faced such as we have faced in the past two years.

Senator WATSON. We are perfectly familiar with those conditions throughout the country. If you can tell us why the rates on dairy products in the Fordney bill are not satisfactory, if they are not, that is what we are interested in.

Mr. PUTNAM. If you would allow me, I would just like to mention one point in connection with the decline in the number of farms and also the number of families, because some people may raise the question that the farms abandoned in New England are the farms that are situated back from the markets and which are not desirably placed properties on which to live. I want to mention one instance which is in my own town. The neighborhood of which I speak is within 6 miles of the statehouse at Concord, within 2 miles of a State road, and all these farms can reach stores and post offices and churches inside of 2 to 3 miles, and some of them within a mile; and years ago, perhaps 25 or 30 years ago, there were on these 13 farms which I speak of, right in one neighborhood, on one New Hampshire hill, where there is as good soil as there is in the State of New Hampshire, 200 head of live stock kept, there are now 50 head. There were 65 people living on those farms, and there are now 12. Of the 13 farms there are 2 upon which live stock is kept, and there are now 6 children in that neighborhood, while, as I remember, years ago there were over 20 children, and a school was run there which is now abandoned.

I mention that just to bring out that one point that the abandonment of farms is not confined to those that are far back, but to those as well which are located, you might say, near to the markets. The reason the farms are being abandoned is because farming as a business is not as profitable as other lines of business have been, and when the boys grew up they left these farms and went to town and into some other line of work for better wages.

Senator JONES. So that now the farmer in your section of the country under 50 years of age is a curiosity?

Mr. PUTNAM. I would not quite state that, but I will say that the percentage of farmers who are under 50 years of age has decreased very, very materially in the past 10 years. There is no question about it, and it is getting more and more that way.

Senator WATSON. Is it your theory, those conditions being equal, that farming in New England is not as profitable as it was 25 years ago?

Mr. PUTNAM. Dairy farming is not under present conditions. A few men engaged in the fruit industry for the past few years have been successful, because they have got good markets. But the dairy farmer, who is the man who stays there 365 days in the year—and I speak personally from my own experience, because I was born on he farm I am now on, and I say frankly to you gentlemen that the ast three or four years have been the most unprofitable years, and t was unprofitable because dairy cows have been unprofitable.

Senator JONES. State your age.

Mr. PUTNAM. I was born in 1864.

Senator WATSON. It would seem with the constantly decreasing umber of farms and farmers and with the constantly increasing emand because of the increase of population in cities that prices ould be enhanced.

Mr. PUTNAM. Yes; it is true. But competition coming from the utside has to an extent flooded the markets.

Senator WATSON. That is the very feature we want to get at.

Mr. PUTNAM. I will cover that right here.

Senator SUTHERLAND. Have not the younger people gone to Canada farm, where land is cheap?

Mr. PUTNAM. No, sir. Very few of our people have gone out of ew England. They have gone into certain lines of industry in New ngland which have afforded them a better wage. For instance, I d a herdsman who had been with me 10 years, and a machine shop my own town offered him better wages. He was not a machinist any sense of the word; he never had done any work at all excepting the farm. He worked on the farm all his life, a man 50 years old. e is now working in the machine shop because he gets more money an I can pay him.

Senator SUTHERLAND. Is it not a union shop?

Mr. PUTNAM. No, sir. They are paying probably the union wages. hould judge so.

It is true that the dairy business in Canada has increased very terially and the imports into this country from Canada have reased very materially. In 1913 there were 35,000 pounds of tter brought in from Canada into the United States, while in 1920 ere were 9,000,000 pounds brought in.

Of cream in 1913 there were 800,000 gallons brought in, while in 20 there were 1,300,000 gallons brought in.

Of milk there were 8,000 gallons brought in in 1913, and 1,500,000 llons brought in in 1920. So we living near the dairy sections of nada to-day have had to meet that competition.

Senator McLEAN. What do you get for milk now?

Mr. PUTNAM. Depending on where it goes, into the market—I can e you some figures a little later that will give you some enlightennt on that.

Our business has not been unprofitable because we have sold off r cows down to the point where the overhead does not compare the volume of business we do. The statistics show that the numr of dairy cows in all New England has varied very little between 10 and 1920. There were 841,698 cows in New England kept for lk in 1910, and 842,928 dairy cows over 2 years of age in 1920.

Senator SUTHERLAND. While our population has increased?

Mr. PUTNAM. Our population has increased quite materially.

Senator SUTHERLAND. So the number of cows per thousand popu-lation would be somewhat less?

Mr. PUTNAM. Yes; certainly. I have a chart here that shows som of these things. In my own State of New Hampshire the tota population in 1910 was 430,572, of which 256,439 were urban an 174,133 were country population—the country population includ all people living outside incorporated places—while in 1920 of 443 people, an increase of something like 11,000 over 1910, 284,0 were urban, as compared with 256,000 10 years ago, and 159,000 we country people, compared with 174,000.

I want to bring to your attention just one sheet, which to my min illustrates very clearly the reason why New Hampshire farms a being deserted or abandoned at the present time and have bee while the number of people engaged in farming has decreased mate rially. This sheet is the result that we found by a survey tak on 12 herds distributed over different sections of New Hampshi taken under the direction of the farm management representati of the State college, who was a State and Federal employee, going these farms and taking the survey with the farmer, and the farm keeping accurate accounts for years, these accounts being check up monthly by the representative of the college—and it shows—I give you the summaries. It shows in cost $3.87 a hundred to prod milk on those farms and deliver it to the station where the party s the milk. The standard market price in the tenth zone, which comparable to these figures for milk shipped to the Boston mar during this same period, which was from the beginning of April, 19 to the end of March, 1921, was $3.25 a hundred. That is what t farmers actually received who shipped their milk to the large c tractors in Boston, delivered at their station.

Senator McLEAN. Per quart?

Mr. PUTNAM. Per hundred pounds—$3.25 as compared with p duction cost of $3.87.

Senator WATSON. That is to say, he lost money?

Mr. PUTNAM. He lost 62 cents on every hundred pounds.

Senator SUTHERLAND. How many gallons are there in a hun pounds?

Mr. PUTNAM. A quart of milk weighs practically 2.15 pounds.

Senator WATSON. There are 46½ quarts to a hundred pounds?

Mr. PUTNAM. These cows produced 6,387 pounds of milk. I were exceptionally good herds. They were herds where a man been keeping records for years and improving and using those rec upon which to improve the herds. Therefore, the milk, 6,387 pou is at least 1,387 pounds above the average for the State and prob even more than that. So they were as profitable herds, taking i from a production standpoint, as we could expect to find, and w much better than the average. The loss upon each cow figure cents a hundred, for the milk produced was $39.60 per cow; the la cost, 254 hours, at 40 cents per hour, or $1.02 to produce 100 pou of milk, and figuring the hours that the man put in, and taking the loss here, the man who owned these cows got 16 cents an h for this labor by paying the hired men 40.

There is the reason why people are leaving the farms in New Engd. It is because the price received for their product does not give m the same wage they can get elsewhere; it does not even give wage paid the farm hands whom they are hiring on the farm. I e hired five men regularly, three married men and two single men, l I have not a man working for me—and I speak from actual perience—but what has drawn nearly double the wage I have in past three years. I may say in years back, from 1900 to 1910, I e never seen a time but what I could get a living in the dairy iness. But I tell you, gentlemen, it has been impossible to do it the past few years, in doing a volume of business that requires employment of men. If the small farmer with 8 or 10 cows in a all place is willing to work as those men did per small wage, sing some of the needs of life on his farm, he can, as we express it, et by." But as a business proposition, dairy farming in New gland has not proved for the past few years profitable and is not fitable at the present time, and unless something can be done to t that business on a basis to give reasonable life and compensation the men who have got their money invested in it, we can not expect hold the number of men on the farms that we have now, and instead it decrease will continue. It must be so, because people have got live, and with the increased tax burdens and burdens all along the e it is impossible. Man after man is closing out all the cows he has, d this year he is closing them out at 50 per cent, and even less an 50 per cent, of the price they are valued at in the census report ken a year ago.

We have got over $1,000,000,000 invested in agriculture in New gland. You will hear people say, as it was put up to our repreatative who came out to meet one of the departments of the Govament for the purpose of getting some money to take back into w England to help finance their business there, "We do not look on New England as an agricultural section."

Senator WATSON. Mr. Putnam, what does it cost the Canadian rmer, on the average, to produce 100 pounds?

Mr. PUTNAM. Those figures will be submitted by a witness who llows me.

Senator WATSON. Can you tell me whether it costs more or less?

Mr. PUTNAM. It costs less materially, and we are here asking, and l we ask. a duty on dairy products that will put us on an equality our markets with the Canadian producers.

Senator WATSON. How much is that?

Mr. PUTNAM. Speaking from a dairy standpoint, I could figure it cents a pound, and a duty that is comparable to that on milk, eam, and other products.

Senator WATSON. If your figures are correct—and I have no doubt ey are—2 cents a gallon would not be protective to you at all.

Mr. PUTNAM. We are not asking for that. We are asking for mething that will put us on an equal footing so we can hold for the ew England dairy farmer the dairy market.

I want you gentlemen to get this point in closing: That there is me agricultural business in New England; that we have 1,000,000,000 invested; that dairying is the largest industry we ave; and that the prosperity of New England agriculture depends n the prosperity very largely of the dairy farmer.

Senator SUTHERLAND. You are asking for 10 cents a pound?

Mr. PUTNAM. On butter, and a comparable basis on milk, cream and other products, figuring it out on the butter-fat content.

(The tables referred to are as follows:)

Decrease in number of farms, 1910 to 1920.

[Fourteenth United States Census.]

	Number of farms. 1910	Number of farms. 1920	Decrease.

e paid per hour of labor to producer		.16

ATEMENT OF JOHN A. NESS, PRESIDENT MAINE DAIRYMEN'S ASSOCIATION, AUBURN, ME.

Mr. NESS. My name is John A. Ness; my residence, Auburn, Me.

Senator WATSON. What is your business?

Mr. NESS. Farming. Mr. Chairman and gentlemen, I have the nor to represent the dairy interests of the State of Maine here this committee. In our appeal in support of the New England iry Tariff Committee, asking a higher tariff on our dairy prod-

ucts, so that we can get a better living out of our industry. I will present to you actual figures, as taken from 17 different herds, giving the production and receipts for the product as received by these 17 different dairy farms. They are taken from various sections, from 9 of the different counties out of 16, so that we would get the average condition and not isolated condition. Of course, the reason why we are not giving figures from some other counties, for instance, Aroostook, is because it is a potato section. But we have a relative comparison with the different counties that are more or less dairy counties.

A general statement of the whole matter to show you how these figures were gotten might interest you. A survey was made to determine the cost of pasturage, an inventory of the herd, buildings and equipment was taken at the beginning of each account. Credit has been given for whole milk used on the farm at the same rate as milk sold; skim milk used on the farm credited; and credit given for manure and other things at uniform rates per cow per year on the basis of the number of cows in the herd. The use of buildings was secured by figuring 10 per cent of the value to cover interest, taxes and depreciation; the use of equipment was also secured. Hay was charged at the actual market value, the farmer's own time at replacement cost of the hired help, not at what the farmer ought to get as owner and on investment as well as his time put in. The depreciation of cows was secured by adding to the value of cows on June 1, 1920, the value of all cows and heifers which freshened during the year and from that total deducting the value of the cows on hand May 31, 1921.

In the matter of feed, hay, silage, grain, and other things entering into the production of milk it was $117.08. The human labor was set at $50.87. Other costs, such as interest, taxes, insurance, depreciation on cows, use of fields, use of equipment, hauling milk, and horse labor, were $71.04, making a total cost per cow of $238.99. The total credits per cow other than milk amounts to $29.50, the cost of milk per cow $209.49, making a net loss per cow of $38.21.

Senator JONES. You say that that includes the depreciation. Do you mean that you took into consideration the difference in the market price or value of those cows?

Mr. NESS. Yes, sir; the exact conditions from June 1, 1920, when an inventory was taken at the exact price at that date.

Senator JONES. How much was that depreciation owing to the reduced value of the cattle?

Mr. NESS. Up to May 31—I could not say exactly, though not as much as it would be to-day. But detailed figures are at hand and will be given by some of the speakers showing exact figures.

Senator JONES. If some one else is going to give it, very well. But I think that is a very important factor. I think some cows have depreciated that much in price, just for a single cow, and more.

Mr. NESS. The cows certainly have depreciated in price.

Senator JONES. There is no question about it, and I think the depreciation probably between those two dates in the value of the cows is as much as the total loss per annum that you figure there.

Mr. NESS. The depreciation as given by those figures, $19.37 per cow, would mean that that is just about half the depreciation and not the total.

The cost per hundredweight of milk is $3.76; received per hundredweight for this milk, $3.08. The average return per hour labor

e farmer gives simply 8 cents, or a little better, showing that, of urse, there is considerable loss and has been in past years, in support of the contention of the New England Tariff Committee in the ll as presented by them.

The point I would like you specially to note is the cost of milk per undredweight, and this cost is a little better, or a little less than the erage would be for the whole State, because of the production of ilk. The production per cow as given here for these 17 different rds is 5,566 pounds of milk. The average for New England is 000 pounds or less.

The point I wish to bring out is the fact that there was a loss here $38.21 per cow, and the farmer only received for his labor 8.8 nts per hour spent in taking care of his cows.

MMARY OF THE COST OF MILK PRODUCTION ON 17 MAINE FARMS FOR THE YEAR ENDING MAY 31, 1921.

[Compiled by M. D. Jones, farm management demonstrator.]

GENERAL STATEMENT.

The data given in the following tables were computed from monthly reports furshed by 17 farmers. A survey was made to determine cost of pasture and bull rvice on each farm. An inventory of the herd, buildings, and equipment was taken the beginning of each account. Credit has been given for whole milk used on the rm at the same rate as that received for milk sold. Skim milk used on the farm was edited at 30 cents per hundred. The credit for manure was made at a uniform rate $20 per cow per year on the basis of the number of cows in the herd each month. se of buildings was secured by figuring 10 per cent of the value to cover interest, xes, and depreciation. Use of equipment was secured by figuring 15 per cent on the lue to cover interest and depreciation.

Hay has been charged at market value at the farm; labor at cost, or in case of the rmer's own time at replacement cost; grain and other items of cash expense have en charged at cost. Depreciation on cows was secured by adding to the value of ws on hand June 1, 1920, the value of all cows purchased and heifers which freshened uring the year, and from this total deducting the value of cows on hand May 31, 921, plus the value of cows sold and slaughtered.

According to these records, the average cow lacked $38.21 of paying expenses. n other words, the average farmer received 8.8 cents per hour for his time while orking on dairy cows.

Cost of production.

[17 herds; 180 cows.]

Per cow basis:		
Feed—		
Grain, 1,893 pounds	$53.55	
Hay, 3,180 pounds	33.33	
Silage, 4,021 pounds	15.89	
Green feed, 1,071 pounds	3.81	
Corn stover, 357 pounds	1.14	
Other feeds, 200 pounds	.82	
Pasture	8.54	
Total cost of feed per cow		$117.08
Labor—Human labor per cow, 144 hours		50.87
Other costs—		
Interest, taxes, and insurance on cows	7.08	
Depreciation on cows	19.37	
Use of buildings	17.29	
Use of equipment	3.34	
Bull service	3.86	
Ice	3.22	
Hauling milk	11.40	
Horse labor, bedding, and miscellaneous	5.48	
Total other costs per cow		71.04
Total cost		238.99

Per cow basis—Continued.		
Credits (other than milk)—		
Manure	$19.93	
Calves and calf hides	8.70	
Feed bags and miscellaneous	.87	
Total credits per cow		$29.[illegible]
Net cost of milk per cow		209.[illegible]
Milk production, 5,566 pounds, value		171.[illegible]
Net loss per cow		38.[illegible]
Cost of milk per hundredweight		3.[illegible]
Received for milk per hundredweight		3.[illegible]
Cost of milk per quart		.0[illegible]
Received for milk per quart		.0[illegible]
Average return per hour for labor used		.0[illegible]
Total for 17 herds:		
Feed—		
Grain, 340,703 pounds	9,638.94	
Hay, 572,346 pounds	5,999.56	
Silage, 723,715 pounds	2,859.72	
Green feed, 192,790 pounds	686.31	
Corn stover, 64,198 pounds	206.22	
Other feeds, 35,912 pounds	146.73	
Pasture	1,538.14	
Total cost of feed for 17 herds		21,075.[illegible]
Labor—Human labor for 17 herds, 25,991 hours		9,156.[illegible]
Other costs—		
Interest, taxes, and insurance on cows	1,273.76	
Depreciation on cows	3,487.00	
Use of buildings	3,112.70	
Use of equipment	602.07	
Bull service	695.18	
Ice	579.89	
Hauling milk	2,051.61	
Horse labor, bedding, and miscellaneous	987.02	
Total other costs for 17 herds		12,789.[illegible]
Total cost		43,0[illegible]1.[illegible]
Credits (other than milk)—		
Manure	3,588.00	
Calves and calf hides	1,565.76	
Feed bags and miscellaneous	157.08	
Total credits for 17 herds		5,310.[illegible]
Net cost of milk for 17 herds		37,710.[illegible]
Milk—Production, 1,001,899 pounds, value		30,83[illegible].[illegible]
Net loss for 17 herds		6,87[illegible].[illegible]
Cost of milk per hundredweight		3.7[illegible]
Received for milk per hundredweight		3.0[illegible]
Cost of milk per quart		[illegible]
Received for milk per quart		[illegible]

I have a letter here from one of the largest dairy systems in New England, the Turner Centre System, and they are also in favor of the

ariff as supported by the New England Tariff Committee. If it is our pleasure I will read that letter. [Reading:]

CHARLESTOWN, MASS., *November 12, 1921.*

he NEW ENGLAND DAIRY TARIFF COMMITTEE,
Boston, Mass.

GENTLEMEN: As a strictly cooperative dairying concern representing 4,000 proicers of milk and cream in Maine and New Hampshire, we desire to go on record commending a new tariff that equalizes the rates on milk and cream with the rates i butter. Our association is chiefly concerned in the marketing of New England oducts, which under the present tariff is hard to do profitably. There is ample pply of milk and cream in New England to assure the public of a sufficient supply these products without the Canadian shipments.

When you realize that 1 gallon of 40 per cent cream carries a tariff rate of only 10 nts while a pound of butter carries 8 cents, you can readily see the injustice our oducers are suffering. One gallon of this cream will make 4 pounds of butter, nce the rate for cream on a comparative basis should be four times as much, or cents per gallon.

Our entire interest in this matter is to secure more money for the New England oducers of dairy products. By placing a duty as recommended on the foreign pply our producers would be able to market a greater amount of product. This uld mean better returns to New England producers without added cost to the nsuming public. Hoping you may be able to assist us in this matter, we are,

Very truly, yours,

WESTON B. HASKELL.

Mr. NESS. In support of our plea for a higher tariff I would like to bstantiate what Mr. Putnam said in reference to the age of the rmer on our New England farms, and that is this: The dissatisfied ung farmer who was ready to leave his farm has left his farm because ht around us we have manufacturing industries that are paying ges which we can not pay on the farms.

Senator WATSON. Does the desire of the young man to live in the y and enjoy the society in general of city life and see the bright hts have something to do with it?

Mr. NESS. The young fellow who has not got to the age of seriouss of life, yes. But it is the income consideration, that he could not e as he would like to live on the farm and have the enjoyments at a man ought to have to lead an honorable life.

Senator JONES. One of those advantages, so called, of the cities is led to the wage and considered a part of his wage; it is a part of inducement for him to go into the cities?

Mr. NESS. Yes; but primarily it is the wage.

Senator WATSON. You think primarily it is the wage?

Mr. NESS. Absolutely, I think so.

Senator SUTHERLAND. That the schooling facilities have something do with it?

Mr. NESS. The schooling facilities are taken care of in my own ghborhood. The children of the rural schools are taken into the es and larger towns in conveyances. The school advantages are y fair. I will not make any comment here on that score.

Once the young man gets away from the farm, with the high wages l those inducements you speak of, with society life, where it costs ttle more money to live, and after he is once taken away it is rder to get him back.

STATEMENT OF JAMES A. LEACH, PAWLET, VT.

Senator WATSON. Give your name and residence.

Mr. LEACH. James A. Leach, Pawlet, Vt. I am the owner of a ry having 43 cows and am president of the Bennington County

Farm Bureau Association. I am glad to know that the whole committee are going to be possessed of the facts that we bring. I am also glad that, as a citizen of Vermont and a farmer who is largely interested in the price and the markets of dairy products, I can come personally and add my bit of testimony and experience.

I thought it might be helpful to you gentlemen if you had my personal statement of my own experience on the farm from July, 1920 to July, 1921. I will not go into detail at all, but I just want to explain to you that I have 43 cows valued at $100 apiece. I placed the valuation where I thought the valuation of a good-grade cow should be placed. That does not represent the value of those cows, because a good many of them are pure breds and are worth considerable more money.

Senator WATSON. Are they Jerseys?

Mr. LEACH. Holsteins. Also, in the matter of depreciation on the dairy machinery and equipment and the cattle I have placed a figure of 10 per cent. That is a very small depreciation. I tried to be perfectly fair with my herd in this matter. I do not want to overdraw any of these statements. I am sure Senator Dillingham, who is familiar with this matter, will tell you that these are conservative figures.

Senator WATSON. How many cows have you?

Mr. LEACH. Forty-three.

Senator WATSON. How long have you been in business?

Mr. LEACH. Fifteen years. The earlier part of my life I spent in merchandising in Nebraska and losing my health and coming back on the farm, which accounts for my gray hairs when I have only been 15 years engaged in farming.

There is one other item which I would like to speak of which puzzles some people. It probably does not puzzle you. That is how we dairymen manage to keep on living and doing business and losing money all the time. If you will look this through you will see that I raised 110 tons of hay worth $20 a ton in the barn. I placed the valuation on it in the barn, which is just what my produce would have sold for at the barn. That is what I charged the dairy. I also had 220 tons of ensilage at $5.50 per ton. Then I also raised quite a good lot of dairy feed, which I valued at the same figure that I had to pay for what I purchased. I will submit this statement. If there are any questions that you would like to ask I shall be very glad to answer them.

Senator WATSON. Let the statement go into the record.

Receipts and expenditures in connection with dairy herd, July, 1920, to July, 1921.

RECEIPTS.

Sale of milk	$6,[illegible]
Milk fed to 10 calves	[illegible]
Milk used in the home	[illegible]
30 calves, at $3 each	[illegible]
10 pure-bred calves, at $15 each	[illegible]
300 loads of fertilizer, at $3 each	[illegible]
Total receipts	[illegible]

EXPENDITURES.

00 acres of pasture land	$6,000.00	
3 cows	4,300.00	
bull	250.00	
airy machinery and equipment	750.00	
	11,300.00	
nterest on $11,300 at 6 per cent		$678.00
oss and depreciation:		
Pasture land, 5 per cent		300.00
Stock and machinery ($5,300), 10 per cent		530.00
Insurance and taxes		172.43
Labor		1,220.00
Supervision, 10 per cent ($7,898.26, receipts)		789.83
eed		
110 tons hay, at $20 per ton		2,200.00
220 tons ensilage, at $5.50 per ton		1,210.00
Dairy feed		2,804.59
Total expenditures		9,904.85

Mr. LEACH. In a general way I would like to tell you what has ome to me through my experience in the milk business.

Senator WATSON. Suppose you had no Canadian competition?

Mr. LEACH. We would have much more room for our surplus milk. hat is what is troubling us.

Senator WATSON. You think that your trouble arises from Canaian competition in your industry?

Mr. LEACH. Very largely. The Danish butter that came into oston quite seriously affected the price several times last spring, nd, of course, replaced some of our product. Canada and Denark seem to be the source of our troubles.

During the period of time that I have been a milk producer and een familiar with the Boston market I have seen the supply of the oston market furnished from more and more distant points. That the supply has receded. Very soon after I began to produce milk e Boston dealers were coming into my territory, 200 miles from oston, and buying milk. They went farther and farther away, ntil finally they got back into the 12th zone, as we call it up there, St. Albans and up at Newport, Vt.; and in more recent years ey have crossed the border and gotten into Canada.

What is the reason that the farmers object to their buying milk in anada?

Senator WATSON. Let me ask you, before you start on that: Do ou know how far north of the border they go in buying milk for the oston market?

Mr. LEACH. The Hood Co., with whose business I am more or less miliar, being a member of their surplus committee, the Vermont ember, buys milk only from such a distance across the border as ey can transport by teams over to their stations, but they go back uite far for cream. I am not positive, but I have been informed at milk comes in for some of the other Boston dealers from across e line—the Plymouth Creamery Co., for instance. They get it om quite a distance over the line. I know that cream comes in for e Hood Co. from quite a distance.

Senator WATSON. Do they go over there to buy it because they can buy it more cheaply than they can buy it from the New England producers?

Mr. LEACH. Yes, sir.

Senator WATSON. How much more cheaply can they buy it, on the average, than they can buy it from you?

Mr. LEACH. If you will pardon me, we have those facts all in black and white and they will be given to you exactly as they are.

We hear a good deal about abandoned farms in New England, and especially in Vermont, and we are likely to think that those farms ought not to have been settled in the first place, unless we know something about it first hand. I can tell you from positive knowledge that many of those farms ought to be producing at the present time and would be if the markets were right. What has happened? They are growing up to brush and growing less and less in value. Take, for instance, the town of Andover, which is a mountain town with Chester as its station. The taxes in that town are 4½ per cent. A gentleman who was telling me about it said that there are very few occupied farms. I was riding with him, and the roads are miserable. I said, "It seems to me that with 4½ per cent taxation you ought to have better roads." He said, "There are so few of us to raise the money. The revenue is so small."

That is what is happening to those towns because of taking the market away from them and giving it to Canada and Denmark. Then, of course, along with that, comes the decrease in population. Our boys leave the farms and go to the cities, as Mr. Putnam has told you. They do not all go to the New England cities or the Vermont cities. Vermont is peculiar in this particular. I only want to call your attention to that. Vermont has not any large cities that offer the attractions that New Hampshire and Maine cities offer, so that our boys are likely to go to Boston or New York and out of our State. That is a serious problem with us in Vermont.

I have raised four boys and I gave them good farmer's advice. I raised them on the farm, and one of them is staying with me on the farm, and, of the other three, two of them are already in cities and one of them plans to go. That is just an illustration of my own. My neighbors are having the same experience.

There is another reason why we should keep our market within our own borders. That is that it is impossible for us to have proper supervision. We can not have any supervision, in fact, can not enforce any supervision in Canada in regard to the surroundings in which the milk is produced; and we find, by a survey that we have made this past season, that in Canada, as compared with New England, their facilities are very crude indeed. They have not ice houses or cooling plants. We call them milk houses, with plenty of cool water to cool the milk immediately after it is drawn from the cows. They have not those facilities there. There is no way of insisting on that or putting over any proper supervision up in Canada such as there is in our own country. Therefore the cream and the milk that come from Canada can not be as well prepared for the market

They have not the facilities to do that. Our cream and milk go in properly cooled and in a satisfactory and merchantable condition.

What are the conditions in Canada for market production? That is, what do we have to compete with in New England because of the lesser price in Canada? Canada can produce milk more cheaply, for one reason, because of its less careful production, less expense in providing ice houses and in cooling the product and taking care of it. That is quite a material item in the expense of producing milk. The mothers and the daughters and the children of the farm home in Canada are experts in the care of cattle and in milking. They assist very materially in the care of the dairy and in the milking of the cows, which is not true, of course, in New England; and I do not believe any of us want it ever to be true that our wives and daughters should do labor of that sort. We are facing it, of course, either that or going out of the business.

Senator WATSON. How is dairying in the State of New York as compared with what it used to be?

Mr. LEACH. I can not speak for the whole of the State, but my own borders on New York. Their conditions over the line are similar to those on our side of the line. It is a good milk-producing country. My county, Bennington, is one of the finest places on earth in which to produce milk. We have splendid mountain streams and cold springs and the grass is fine. We do not suffer much with drought there. We did not this season, although in some sections it was quite severe.

Senator WATSON. What is your land worth, on the average?

Mr. LEACH. I was offered for the farm, 341 acres, $16,000. I put valuation on the pasture land, you will notice in my statement, of $30 an acre. I have a very good pasture. It might seem to Mr. Dillingham a little high, but I have an exceptionally good pasture, and, of course, good pasturage means less grain.

Washington County is a good milk county. Borden's people buy great quantities of milk in Washington County for the New York market.

It seems strange to say that our investigators in Canada found that the home comforts and conveniences on the farms there were greater than they were in New England. That proves this, of course, that those Canadians have made more money out of farming than we New Englanders have. It seems strange that they could do it, but that is the proof of it.

Senator WATSON. Do they not have more fertile land than you have?

Mr. LEACH. It is right in the dairy districts.

Senator WATSON. Is the character of the soil quite similar?

Mr. LEACH. I can not say. I was not one of the committee that investigated the matter, but I have always understood that the soil just north of our New England border, especially north of Vermont, is very rich. I suppose it is very similar to the soil in my State. Franklin County and those northern counties of Vermont are splendid counties—at least Franklin County is.

Speaking about the conveniences of the home in Canada, we made some notations and we have an exhibit, marked "Exhibit E," that will illustrate what was found there in connection with the farm homes as to conveniences and how it was that they could produce milk more cheaply than we can.

Senator McLean. Are the people in Canada to whom you refer French?

Mr. Leach. Yes. I know they are mostly or very largely French. Some of them came over the border, and I know the conditions along the northern border of Vermont where I have visited the production plants, and a great many of those families are French, and the same conditions prevail there along the border as prevail over the border.

Senator McLean. They have larger farms and do their own work, I suppose?

Mr. Leach. That is the idea. They raise large families and hire no help scarcely. They all work, from the little tot, just as soon as it can begin to trot around the farm. They all have something to do, which is all right if they do not work too hard and if they do the right kind of work. We do not want our mothers and wives and daughters doing outdoor work in New England.

I was going to speak about the supply of milk. That is, of course, something that we must watch in order to see that our cities are going to have an abundant supply. I want to call your attention to the fact that $94,000,000 worth of dairy products were sold in New England in 1919 from New England farms. A little more about that later.

Our supply of milk and cream should come from New England. Milk and cream are very perishable. To have the milk shipped from great distances and to have the cities rely on far-distant points for their milk and cream, you can readily understand, would be almost sure to result in disappointment to the consumer very frequently. Milk can not be gotten in from long distances and compared with the New England product.

In regard to the supply, suppose the milk that entered into the manufacture of butter in 1919 had been kept as sweet cream for the market? We could have replaced the Canadian cream eleven times. That butter was made from eleven times as much cream as was brought in from Canada, and that amount was 416,000 gallons. That is, we could have supplied eleven times 416,000 gallons if we had not made it into butter. I refer you to Exhibit G, which substantiates that statement.

If we depend upon Canada for our sweet cream in increasing quantities and let Vermont continue to make butter and sell it as butter, and something should develop that made it impossible for us to get what cream we needed in Canada, the natural inference would be that we could turn to New England for some of this cream. That is not quite true, because the creameries and private manufacturers of butter usually contract their butter, and they would be tied up in some sort of business arrangement possibly that would make it very awkward. People would be deprived of their cream perhaps at the time that they needed it most. You can not change from a butt

naking arrangement to milk and cream production for the market rithout some little time, some little notice.

Senator McLEAN. Take the ice cream that is used in the large cities, uch as Boston. It goes to other large cities. I think one of the ritnesses who appeared here several months ago testified that that ras a special use and one which could not be accommodated by the lew England dairies; that there was not enough milk produced to atisfy this demand for ice-cream purposes. That is as I remember it.

Senator WATSON. Yes; that is what the testimony was.

Mr. LEACH. Yes; I think I have heard that same story.

Senator McLEAN. It was stated that the cream that was used for omestic purposes and for butter had a separate commercial field by self, and that unless they got the necessary cream from Canada e cream would be very expensive.

Mr. LEACH. I do not think such a statement is justified by the cts. These facts that I have just cited would be sufficient to settle at question, I should suppose. But you know that the cream that manufactured into ice cream can be held such a long time by eezing and by cold storage that I should not suppose there would be y chance of any difficulty. In fact, I know there would not be any iance of any difficulty. They turn butter back into ice cream and so powdered milk.

Senator McLEAN. Can you produce in New England sufficient to tisfy the demands for both ice cream and butter?

Mr. LEACH. Oh, yes; abundantly. That is what we want to do. hat is the contention of the farmers in New England.

Senator McLEAN. The idea is that if the dairymen in New England e forced to go into some other business, then the consumers in the ties will be at the mercy of the Canadian price, and, in the long run, ople will have to pay a great deal more than they would if you had asonable protection?

Mr. LEACH. Exactly. The dairy business is not like a business that e could get out of to-day and go into something else to-morrow. e have our cattle. It takes three years to bring a calf up to oduction. It takes about four years, if you plan to have a dairy, efore you have got any milk.

Senator McLEAN. Of course you buy a great deal of grain from itside?

Mr. LEACH. Yes, sir; we use a good deal of grain.

Senator McLEAN. Do you buy hay?

Mr. LEACH. No, sir; I raised all my hay and all of my corn for silage.

Senator McLEAN. Is that generally true of the farmers there?

Mr. LEACH. Yes. That is generally so. It is generally so in New ampshire, Vermont, Maine, and the States below us. Some of em buy their hay where milk is produced near the large cities; but a rule the New England farmer raises all his rough feed.

Senator McLEAN. Do you have any serious difficulty with the indlers of the milk? Do you deal through middlemen?

Mr. LEACH. Yes, sir. The New England Milk Producers' Asso- ation have a price committee who sell the milk of the members of

the New England Milk Producers' Association, which number about 70 per cent of the dairymen of New England. It really amounts to handling all of it, because the other fellows do just as they do. They are in the minority——

Senator McLEAN. Are you at the mercy of the middlemen?

Mr. LEACH. Oh, no, sir.

Senator McLEAN. You get fair treatment from them?

Mr. LEACH. Yes. Through the New England Milk Producers' Association, who are our agents, we have been able to sell milk fairly satisfactorily. It is not the manner that the milk is sold that troubles us; it is the losing or the taking away of the market for so much of our surplus milk that troubles us. The surplus market brings down the price of the whole thing.

Senator WATSON. Statistics show, Mr. Leach, that the average price in 1920 in the New England States was $4.29 per hundred pounds.

Mr. LEACH. That is delivered in Boston.

Senator WATSON. $3.30 in 1921.

Mr. LEACH. Yes.

Senator WATSON. How much do you get for cream?

Mr. LEACH. I sell milk. I can tell you what I got for last month's milk——

Senator WATSON. I am talking about cream.

Mr. LEACH. I am not familiar with cream.

Senator WATSON. You do not sell cream?

Mr. LEACH. No, sir.

Senator WATSON. When you sell milk you sell the whole thing?

Mr. LEACH. Yes.

Senator WATSON. The cream and the milk?

Mr. LEACH. Yes, sir; the milk as it comes from the cow.

Senator WATSON. How old is it before you sell it?

Mr. LEACH. It goes every morning. The night's milk is held over in cold water. It is cooled immediately to the proper temperature and held.

Senator WATSON. Do you sell the night milk and the morning milk both the next morning?

Mr. LEACH. Yes, sir.

Senator WATSON. What do you get for it?

Mr. LEACH. The figures are just out for the Hood Co., a Boston concern, for October—milk, 2.855 for 3.7 milk in the tenth zone. This applies to my dairy.

Senator WATSON. I do not know what you mean.

Mr. LEACH. Milk testing 3.7 per cent butter fat to each 100 pounds brought the patrons of the H. P. Hood Co. delivered in the 10th zone (200 miles from Boston) 2.855 per 100 pounds, or 0.0613 per quart. This is the price I received for my October milk.

Senator McLEAN. You know what it is, do you not?

Mr. LEACH. I shall have to figure it.

Senator WATSON. It is 6 cents and a little over.

Mr. LEACH. Let me further say that there are deductions to be made from that. It costs me 25 cents a hundred pounds to transport my milk to the railroad station.

Senator WATSON. You mean by that that you get that right at 'our farm?

Mr. LEACH. No; I mean the price that I quoted is the Hood price t their railroad stations.

Senator WATSON. At their stations on the railroad?

Mr. LEACH. Yes, sir; where they receive the milk from the farm, nd the station that I supply happens to be far enough away so that costs me 25 cents a hundred to get my milk to the station. I resume that is about the average cost to the New England farmer ie year round.

There is a further deduction. I just want to give you all the facts. told you I was a Holstein man. My milk passes the butter-test andard for the Massachusetts market, which is 3.35 butter fat to 00 pounds of milk. Mine will pass that; but in order to get this rice that I speak of it should pass 3.7, which is 3½ points higher.

Senator WATSON. What do you mean by that?

Mr. LEACH. I mean that the selling standard that applies in our rritory is 3.7 pounds of butter fat to 100 pounds of milk.

Senator WATSON. That is the standard?

Mr. LEACH. That is the standard that we sell by. The Massausetts law calls for 3.35, but, as a matter of fact, the milk averages uite a good deal more than 3.35, and our agent decided on a 3.7 asis. The price per hundred has to be shrunken to three and a half mes, either 4 or 5 or 6 cents, as the value of butter happens to be. shrink my price, on account of being under the 3.7 trading point, iywhere from 15 to 25 cents a hundred more.

So that the price of between 5 and 6 cents is not quite as fancy as it oks. I wanted you to get the facts.

We Vermont farmers would be nicely fixed if we could get 8 cents quart at our doors. We could live as well as we should care to live.

TATEMENT OF W. H. BRONSON, BOSTON, MASS., REPRESENTING NEW ENGLAND MILK PRODUCERS' ASSOCIATION.

Senator McLEAN. What is your occupation?

Mr. BRONSON. New England Milk Producers' Association, Boston, charge of their research department there.

Senator WALSH. How large is this association?

Mr. BRONSON. It has about 20,000 members.

Senator WALSH. From all over New England?

Mr. BRONSON. Yes, sir.

Senator WALSH. And they are engaged in the production of milk small and large quantities?

Mr. BRONSON. Yes, sir.

Mr. Camburn has established a 10-cent rate on butter, we feel. I ish to present the case from the standpoint of what the equalized tes would be on milk and cream with a 10-cent rate on butter.

Equalizing milk on the butter-fat basis, 1 gallon of 4 per cent milk ith a churn gain of 20 per cent would make four-tenths of a pound butter. With a 10-cent rate on butter, that would call for 4 cents gallon on the milk.

The Fordney bill has given us a cent a gallon on milk, which shows that the milk is certainly not equalized with the butter rate. Even at 8 cents a pound on butter the equivalent rate on milk would be something over 3 cents a gallon.

Transportation costs from the center of production to Boston, for example, are one offset factor, making a difference of about one-half cent a gallon. The rate, therefore, we feel, to equalize that with 10 cents on butter, should be 3½ cents a gallon on milk.

The United States Tariff Commission, in their suggested——

Senator WALSH. What is the House provision on butter?

Mr. BRONSON. Eight cents, sir.

Senator McLEAN. How does the rate on cream compare with the rate on butter?

Mr. BRONSON. I will take that up when I have finished with butter, Senator.

Senator McLEAN. All right, sir.

Mr. BRONSON. The United States Tariff Commission, in their suggested reclassification and revision of sections of the tariff relating to agricultural products and provisions, page 13, paragraph 1, makes the statement—

> If it is desired to levy a duty on butter equivalent to that on the milk it represents the duty on 1 pound of butter should be 2.76 times the duty on 1 gallon of milk.

For example, suppose that the butter rate was 10 cents a pound as we propose; then the equivalent rate on milk should be 10 cents divided by 2.76, which would give 3.6 cents. We are asking for 3½ cents.

We therefore feel that the 3½-cent rate on milk is correct from the equalization standpoint of a 10-cent rate on butter. It is just a matter of mathematics as to how much butter fat there is in milk. It is not debatable, as I see it. We have the United States Tariff Commission's statement to back up the rate that we ask for.

Equalization as applied to cream: One gallon of 40 per cent cream with a churn gain of 20 per cent would make practically 4 pounds of butter. At 10 cents per pound on butter, the equivalent rate on 1 gallon of 40 per cent cream, considering transportation costs, would be 35 cents per gallon. The Fordney bill, on 40 per cent cream gives a rate of 10 cents per gallon.

The transportation cost from the center of production in Quebec and the center of production in New England gives an offset of only about one-half cent a gallon, and we have allowed an offset of 4 cents a gallon over its equivalent on the butter-fat basis.

The same authority from which I quoted before, the United States Tariff Commission, on page 11, paragraph 3, states——

Senator McLEAN. The rate in the emergency tariff is 5 cents a gallon on cream, is it not?

Mr. BRONSON. Yes, sir.

Senator McLEAN. Is that satisfactory?

Mr. BRONSON. No, sir. We are asking for 35 cents on heavy cream.

Senator McLEAN. You want 35 cents?

Mr. BRONSON. Yes, sir. We have here a comparison of the rates in the Fordney bill and the rates for which we are asking.

What the Fordney bill allows.	*What dairy organizations want.*
Par. 707. Milk, fresh, 1 cent per gallon; ur milk and buttermilk, one-half of 1 nt per gallon; cream, having less than per cent of butter fat, 5 cents per gal- n; having 30 per centum or more of itter fat, 10 cents per gallon.	Par. 707. Whole milk, sweet or sour, 3½ cents per gallon; cream, sweet or sour, having not more than 20 per cent of butter fat, 15 cents per gallon, for each additional 5 per cent or fraction thereof of butter fat, 5 cents per gallon additional; skim milk, 1 cent per gallon; ice cream mixtures, unfrozen, having not more than 15 per cent of butter fat, 15 cents per gallon; for each additional 5 per cent or fraction thereof of butter fat, 5 cents per gallon additional; frozen, having not more than 15 per cent of butter fat, 9 cents per gallon, for each additional 5 per cent or fraction thereof of butter fat, 3 cents per gallon additional.
Par. 708. Milk, condensed or evapo- ed: In hermetically sealed containers, sweetened, 1 cent per pound; sweet- d, 1½ cents per pound; all other, 1⅝ its per pound; whole-milk powder, 3 its per pound; cream powder, 8 cents pound; and skimmed-milk powder, cents per pound; malted milk, and mpounds of or substitutes for milk or am, 20 per centum ad valorem.	Par. 708. Milk, condensed or evaporated: In hermetically sealed containers, unsweetened, 1 cent per pound; sweetened, 1½ cents per pound; all other, 1⅝ cents per pound; whole-milk powder, 3½ cents per pound; cream powder, 8 cents per pound; and skimmed-milk powder, 1½ cents per pound; malted milk and compounds of or substitutes for milk or cream, 20 per centum ad valorem.
ar. 709. Butter, 8 cents per pound; margarine, 8 cents per pound.	Par. 709. Butter, 10 cents per pound; butter substitutes, 10 cents per pound.
ar. 710. Cheese, valued at less than cents per pound, 5 cents per pound; ued at 30 cents or more per pound, 25 centum ad valorem; cheese substi- es, 5 cents per pound.	Par. 710. Cheese, valued at less than 30 cents per pound, 5 cents per pound; valued at 30 cents or more per pound, 25 per centum ad valorem; cheese substitutes, 5 cents per pound; lactarene or casein, 4½ cents per pound (this article now appears on the free list); all other dairy products not otherwise provided for, 20 per centum ad valorem.

Senator McLEAN. Thirty-five cents a gallon on cream would be equivalent of 10 cents a pound on butter?

Mr. BRONSON. Yes, sir; heavy cream, 40 per cent. We are putting it on a basis which makes possible the bringing in of cream testing lower percentages, if they wish to. We have allowed for that.

As I started to state, the Tariff Commission, on page 11, paragraph of the reference already cited, states that on the basis of physical ivalents the duty on light cream would naturally be five to seven es that on milk, and on heavy whipping cream about eight to times. At a rate of 3½ cents per gallon on milk the equivalent on heavy cream would be from 29 cents to 36 cents per gallon.

Senator JONES. You have all these equivalents figured out here on basis of 10 cents per pound on butter?

Mr. BRONSON. Yes, sir.

Senator JONES. And this is what you think would equalize the ter commodity on that basis?

Mr. BRONSON. Yes, sir. We made a study to see what the differ- ce might represent between a manufacturer or a creamery, for ample, in Canada manufacturing cream into butter in Canada d selling it in the United States compared with sending the cream r to the United States and manufacturing it here. That study owed that a Canadian creamery within 60 miles of the United

States border could, in September, 1921—we took the latest month we had—have made 21 cents per gallon more on shipping cream to the United States to be manufactured into butter here than it could be manufactured into butter in Canada and shipped to the United States for sale.

Senator WALSH. That is under existing rates?

Mr. BRONSON. Under the rates as proposed in the Fordney bill. Under existing rates I think it would be even higher.

This is of importance, for the reason that 70 per cent of the butter produced in Canada is produced in the two Provinces of Quebec and Ontario, and some 50 to 60 per cent of the butter is produced within 60 miles of the United States border. This proposition came up at the time of the old Payne-Aldrich Act, and the Turner Center System in Maine wrote to Senator Frye, of Maine, about the inequalities, and the Senator said it was too late, that the hearings were all closed and nothing could be done. Mr. Bradford, of that creamery, told me the other day, "We were situated as well as anybody was, and decided to go into the business ourselves."

I have their record, which shows that from 1910 to 1916 they shipped in over 4,000,000 pounds of butter fat from Canada to be manufactured into butter at their plants in Auburn and other points in Maine, thus evading the butter rate, and by paying only the 5 cents a gallon on cream when the butter rate was 6 cents at that time.

We feel that unless the cream and butter rates are equalized you will have that coming into operation—the operation of what they call line creameries, where cream is bought in Canada, carried across to the American side and manufactured into butter, paying the cream duty and evading the butter duty.

To show that the producers are not the only people who recognize this inequality, I want to call attention to one of the public trade papers which shows that they also recognize the inequality of the cream and butter rates.

The New York Produce Review and American Creamery, published in New York, in its issue of July 6, 1921, page 562, has an editorial on "The new tariff bill," which, among other things, says:

> One of the most apparent inconsistencies in this list is the relation of duties on butter and cream. A gallon of 29½ per cent cream weighs about 8.35 pounds and contains about 2.5 pounds butter fat. Thus the butter fat in this cream would enter the United States on a basis of only 2 cents a pound duty, while a pound of butter fat entering the country as butter would pay duty at the rate of about 10 cents per pound. By skimming a very heavy cream (say 55 per cent) the duty per pound butter fat would be only slightly higher than with the thinner cream in spite of the 10 cents per gallon rate on creams testing 30 per cent or higher. This discrepancy should encourage the growth of gathered-cream creameries along our northern border and would possibly lead to some interesting experiments in the practicability of shipping high-test frozen or refrigerated sweet cream to this country from abroad.

That is the opinion of a recognized trade paper which ought to know something about equality between butter and cream rates and the possibility of gathered-cream creameries and the shipment of cream to the United States from Denmark and other points.

Senator WALSH. That paper is not a farmers' journal, is it?

Mr. BRONSON. No; it is a trade paper.

I have a statement here from one of the important cream dealers in Boston, metropolitan Boston, the David Buttrick Co., Arlington.

ass. They bring in anywhere from 100 to 500 or 600 cans of cream day. Mr. Buttrick writes:

ARLINGTON, MASS., *October 29, 1921.*

. W. H. BRONSON,
New England Dairy Tariff Committee, Boston, Mass.

DEAR SIR: With reference to your request for information regarding the tariff on am and the equalization of the tariff rate on cream with the tariff rate on butter, wish to make the following statement, augmented by a few figures, showing great ge between cost of Canadian cream and American f. o. b. Boston.

.. Cream dealers in Boston buying in Canada have been able to obtain their cream about $3 per 10-gallon jug of 40 per cent cream cheaper from Canada than from United States, not considering the exchange rate. They pay a duty at present of nts per gallon, which makes an offset of 50 cents per 10-gallon jug. This difference hree times made up by the difference in exchange rate.

The practice, of course, is to pay in Canada in Canadian money, d the exchange operates to the advantage of the cream dealer buy- g in Canada in that way [reading further]:

. We feel that if the business is properly handled there is no reason why there uld be a shortage of cream, provided the Canadian cream was shut off from the ston market, in that there is plenty of American supply to take care of the demand table cream, and through the proper use of cold-storage facilities it is possible to e care of the ice-cream trade with cold-storage goods. During the past two years re has been no acute shortage. A shortage really affects table goods only, and is erally due to increased consumption of cream in ice cream. This condition is y a matter of a few hours and does not require Canadian receipts to relieve it.

. We believe that since we sell our cream in the United States we should do our t to help move American goods by buying our cream in the United States rather n in Canada. If some dealers require Canadian goods, such goods should arrive he market at an equal price and not at a price that jeopardizes the movement of American product.

. We heartily approve of the tariff rate proposed by the New England Dairy Tariff nmittee, which would give about 35 cents per gallon on 40 per cent cream. We ieve that the tariff rate on milk and cream should be equalized with the tariff on butter.

Yours, very truly,

D. BUTTRICK.

Attached to this letter is a statement of the cost of 40 per cent am per 10-gallon jug, f. o. b. Boston, buying in New England and ying in Canada for the last four months.

Senator MCLEAN. What do you mean by 40 per cent ream?

Mr. BRONSON. Cream containing 40 per cent butter fat.

(The statement is as follows:)

American cream (Boston market).

IS OF PURCHASE: BOSTON CHAMBER OF COMMERCE, PLUS 20 PER CENT PLUS 4 CENTS.

Month.	Quotation.	Plus 20 per cent.	Plus 4 cents.	Cost B. F. in country.	Cost, jug, 40 per cent in country.	Plus transportation.	Cost, jug, 40 per cent f. o. b. Boston.

October	38.8	5.8	2.0	46.6	15.38	1.54	50	60	[illegible]

Mr. BRONSON. This point, it seems to me, is of some importance [illegible] the business men in Massachusetts, and especially in Boston. Und[illegible] the present system of buying in Canada the money is paid, of cour[illegible] in Canadian funds and the money goes to Montreal or Quebec. [illegible] does not come back to Boston, as far as freight is concerned. Th[illegible] money that you pay the New England producers goes out fr[illegible] Boston. It goes to the producers. They take it to grain men [illegible] storekeepers or some one else in the village, and it comes back [illegible] Boston and increases the amount of trade done in Boston. Th[illegible] amounts to anywhere from twenty to thirty million dollars a ye[illegible] We feel that from a business standpoint it is a good thing to keep th[illegible] money in New England and keep it with the farmers. We have p[illegible] a provision into our rates covering ice-cream mixtures. We feel th[illegible] possibly cream and butter fat might come into the country in th[illegible] shape of ice-cream mixtures and pay the rate on butter and the ra[illegible] on cream. We therefore put in a provision to cover that.

Senator WALSH. Don't you think this editorial might well go in [illegible] record?

Mr. BRONSON. Yes.

Senator WALSH. It points out admirably the inconsistencies of th[illegible] different dairy products and how the present rates are going to wo[illegible] out.

Senator SUTHERLAND. We will put it all in the record.

(The editorial referred to is as follows:)

[From New York Produce Review and American Creamery.]

THE NEW TARIFF BILL.

The new Fordney tariff bill introduced in Congress last week, representing [illegible] labors of the Republican Members of the House Ways and Means Committee, prob[illegible] contains no more inconsistencies and inequalities in the imposition of duties on [illegible] ports than may be normally expected under the methods of creating measures of [illegible] character inherent in our legislative system. As a general proposition our legisla[illegible] are swayed in their judgment of a fair margin of tariff protection by the pre[illegible] exerted by and the urgency of the appeal of their constituents. Just at this ti[illegible] the voices of the American producer and American manufacturer prevail. Protecti[illegible] from cheaper foreign products is the more frequently heard demand, and hur[illegible]

uties are the order of the day. Our tariffs move up and down with the swings of opular sentiment. And, as a rule, a swing to higher rates is followed sooner or later y a downward readjustment at the command of the "ultimate consumer."

The vagaries of the proposed schedule of duties on the leading dairy products may e indicated by the following rough comparison: If a Canadian farmer with 100 ounds of 3.6 per cent milk sought a market in the United States, he would pay a uty of about 11½ cents to 12 cents if he sent us the milk sweet; a duty of about 5¾ ents or 6 cents if he sent us the milk sour; a duty of about 7½ cents if he separated e milk and sent us the cream testing 29½ per cent, and a duty of about 14½ cents if e cream, containing the same amount of butter fat, tested 30 per cent. If he churned e cream and sent us the butter, the duty would be about 33 cents. If he condensed e milk, the duty would range from 40 cents to 65 cents, and more according to the gree of concentration and the form in which shipped. If he dried the milk and nt us the powder, the duty would be about 38 cents or 40 cents. If he made it up to cheese worth less than 30 cents a pound, the rate would be in the neighborhood 50 cents, while if the cheese were worth 30 cents to 60 cents a pound, the duties uld range from 75 cents upward to over $1.

One of the most apparent inconsistencies in this list is the relation of duties on itter and cream. A gallon of 29½ per cent cream weighs about 8.35 pounds and ntains about 2.5 pounds butter fat. Thus the butter fat in this cream would enter e United States on a basis of only 2 cents a pound duty, while a pound of butter fat tering the country as butter would pay duty at the rate of about 10 cents per pound. r skimming a very heavy cream (say 55 per cent) the duty per pound butter fat uld be only slightly higher than with the thinner cream, in spite of the 10 cents r gallon rate on creams testing 30 per cent or higher. This discrepancy should courage the growth of gathered-cream creameries along our northern border and uld possibly lead to some interesting experiments in the practicability of shipping h-test frozen or refrigerated sweet cream to this country from abroad.

The higher duties imposed on foreign eggs, in the shell, dried, and frozen, will no ubt be appreciated by the Pacific coast poultry interests. They did not secure all ey asked, but the barrier to cheap imports is perhaps sufficient to curtail the trade at was developing with the Orient.

The feature of the bill that we find most confusing is that section providing for an nerican valuation of imports on which duties are determined on an ad valorem sis. Cheese is the only dairy product that would be subjected to this bewildering position. It is proposed to value imports without regard to cost or replacement lue at point of origin, but on basis of value in the United States on date of shipnt. It is argued by Chairman Fordney that the new plan is more practicable and s objectionable than that prevailing at present, under which he claims invoices evidence of purchase price are frequently fraudulently altered. But a reading of new proposal gives no assurance that appraisers endeavoring to determine values re, often without evidence of value because of absence of comparable offerings, ll be able to make as close approximations of values as those at point of origin of imports. Under the plan an importer could not know in advance of shipment d hardly at time of shipment what duty he would be forced to pay.

In the case of cheese great confusion would arise because of the different method of ming duties according to the value of the product. Since the appraiser alone can ermine the value, the importer of cheese that is worth in the neighborhood of 30 nts could not be certain whether the duty imposed would be at the rate of 5 cents ound or 25 per cent ad valorem. Of course, all this confusion will help the manuturer of foreign types of domestic cheese, which since the middle war years have joyed the patronage of the American markets with little foreign competition, except m Argentina on certain of the Italian styles.

The bill, if enacted in its present form, would probably effectively shut out imrtant quantities of foreign butter, some types of cheese, condensed milk, and haps shell eggs also. Its passage would doubtless have a stimulating influence food prices in this country.

Mr. Bronson. I will file with the committee our brief. I do not ow whether the committee will want that.

Senator Sutherland. I think it should be printed. This is an portant matter to you people. It may be that it will throw some luable light on the subject.

BRIEF OF THE NEW ENGLAND DAIRY TARIFF COMMITTEE.

Paragraph 709 of the Fordney tariff bill provides duties on butter and oleomargarine as follows: "Butter, 8 cents per pound; oleomargarine, 8 cents per pound."

Paragraph 707 of the Fordney tariff bill provides duties on milk and cream as follows: "Milk, fresh, 1 cent per gallon; sour milk and butter milk, one half of 1 cent per gallon; cream having less than 30 per cent of butter fat, 5 cents per gallon; having 30 per cent or more of butter fat, 10 cents per gallon."

DEFINITIONS.

1. *Butter.*—United States Department of Agriculture defines butter as "the clean nonrancid product made by gathering in any manner the fat of fresh or ripened milk or cream into a mass, which also contains a small portion of the other milk constituents, with or without salt, and containing not less than 82.5 per cent of milk fat."
2. *Cream.*—The same authority defines cream as "that portion of milk, rich in milk fat, which rises to the surface of milk on standing or if separated by centrifugal force. It is fresh and clean. It contains not less than 18 per cent of milk fat and not more than two-tenths per cent of acid, reacting substances, calculated in terms of lactic acid."
3. *Milk.*—Milk is defined by the United States Department of Agriculture as "the whole, fresh, clean, lacteal secretion obtained by the complete milking of one or more healthy cows, properly fed and kept, excluding that obtained within 15 days before and 5 days after calving, or such longer period as may be necessary to render the milk practically colostrum-free."

OPPOSITION AND REASONS FOR SUCH OPPOSITION TO RATES ON BUTTER.

We are opposed to the present rate on butter because (1) relative costs of production between the United States and competitive foreign countries show that a higher duty is necessary to protect the United States producers; (2) the increased price level of butter requires a higher rate to give the same ad valorem protection as obtained under former tariffs.

Relative costs, New England and Quebec, Canada.—Based on the difference in the cost of milk production, considering transportation costs, it costs 10 cents per pound more to produce butter in New Eng and than it does in Quebec. In April of 1921 the cost of producing 1 pound of butter in New England was 55 cents and in Quebec 45 cents, leaving a difference in favor of Quebec of 10 cents per pound. Transportation costs to Boston on a pound of butter are three one-hundredths of a cent cheaper from New England than from Quebec. Milk production costs are cheaper in Quebec than in New England primarily because the cost of farm labor is lower in the former Province. (See Exhibit A for detailed costs.)

Relative costs, United States and Denmark.—Relative costs of production of butter between the United States and Denmark indicate that the cost of producing butter in the United States was 35 per cent higher than in Denmark in 1920, due primarily to cheaper labor costs in Denmark. (See attached detailed comparison of costs, Exhibit B.)

Increased price level on butter requires higher rate.—In 1897, when butter sold at 20 cents per pound, a duty of 6 cents per pound was imposed. At the present price level of from 40 cents to 50 cents per pound a duty of at least 10 cents per pound would be required to give the same ad valorem protection. (See price chart, Exhibit C.)

In 1897 the cash wage of farm labor by the month with board in the New England States was from \$17 to \$18,[1] while in 1921 the cash wage paid was from \$34 to \$—, more than double the wage in 1897. Other costs of farm operation have changed in like manner, and at the new level of prices and costs an increased specific duty on butter is required to give the same protection as was given in 1897.

OPPOSITION AND REASONS FOR OPPOSITION TO RATES ON MILK AND CREAM

We are opposed to the present rates on cream and milk because such rates as are carried in the bill are not equalized with the rate on butter. Our contention is that the raw materials—milk and cream—from which butter is manufactured should not enter the country at rates which are not equalized with the rate on butter.

Equalization as applied to milk.—One gallon of 4 per cent milk (8.6 pounds) with a churn gain of 20 per cent would make 0.41 pound of butter. At 10 cents per pound

[1] United States Department of Agriculture, Bureau of Statistics, Bulletin 99, p. 23.

n butter, the equivalent rate of 4 per cent milk, considering transportation charges, ould be 3½ cents per gallon.

Transportation costs on 1 gallon of milk to Boston from the center of production in ew England is $0.042, while from the center of Canadian supply in Quebec it is $0.0485 er gallon, a difference in favor of New England of $0.0065 per gallon.

The United States Tariff Commission[2] states that "if it is desired to levy a duty n butter equivalent to that on the milk it represents, the duty on 1 pound of butter ould be 2.76 times the duty on 1 gallon of milk." With the duty on butter of 10 nts per pound as we propose, the duty on 1 gallon of milk to equalize with butter ould be $0.10 divided by 2.76, or 3.6 cents per gallon.

Equalization as applied to cream.—One gallon of 40 per cent cream (8.3 pounds) ith a churn gain of 20 per cent would make practically 4 pounds of butter. At cents per pound on butter, the equivalent rate on 1 gallon of 40 per cent cream, nsidering transportation costs, would be 35 cents per gallon. Cream testing higher d lower percentages of butter fat should carry corresponding rates.

Transportation to Boston from New England and Quebec centers of production is, spectively, per gallon $0.0545 and $0.0605, a difference in favor of New England of .006 per gallon.

The United States Tariff Commission states regarding equalization of cream and ilk: "On the basis of physical equivalents, the duty on light cream would naturally five to seven times that on milk, and on heavy whipping cream about eight to n times." At a rate of 3½ cents per gallon on milk, the equivalent rate on heavy eam would be from 29 cents to 36 cents per gallon.

After paying the duties now carried in the bill (pars. 707 and 709) a Canadian eamery within 60 miles of the United States border could in September, 1921, have ade 21 cents per gallon more on shipping cream to the United States to be manuctured into butter here than it could to manufacture the cream into butter in Canada d ship the same to the United States for sale. The two Provinces of Quebec and ntario produce 70 per cent of the butter manufactured in creameries in Canada and m 50 to 60 per cent of the butter manufactured in these two Provinces is produced ithin 60 miles of the United States border. (See Exhibit D for details.)

The butter trade recognizes inequalities of cream and butter rates.—The New York oduce Review and American Creamery, published by Urner-Barry Co., New York, its issue of July 6, 1921, page 562, has an editorial on "The new tariff bill," which, mong other things, says: "One of the most apparent inconsistencies in this list is e relationship of duties on butter and cream. A gallon of 29½ per cent cream weighs out 8.35 pounds and contains about 2.5 pounds of butter fat.. Thus the butter fat this cream would enter the United States on a basis of only 2 cents a pound duty, ile a pound of butter fat entering the country as butter would pay duty at the rate 10 cents per pound. * * * This discrepancy should encourage the growth of thered-cream creameries along our northern border and would possibly lead to some teresting experiments in the practicability of shipping high-test frozen or refrigerated eet cream to this country from abroad."

Butter duty will be evaded unless cream carries a duty equalized with butter.—With e cream duty of 5 cents per gallon as in the Payne-Aldrich Act or free as in the nderwood bill, it was profitable to ship cream from Canada to the United States d then manufacture the cream into butter. One New England creamery (the mer Centre System) of Auburn, Me., brought in over 4,000,000 pounds of butter for this purpose from 1910 to 1916.

Ice-cream mixtures.—Cream might enter the country by the addition of sugar as ice-cream mixture and thus evade the rates on cream. We contend, therefore, at this combination now becoming of commercial importance should carry rates ualized with the rates on cream on a butter-fat basis.

HISTORY OF DAIRY INDUSTRY IN NEW ENGLAND AND CANADA.

For the past 20 years the source of Boston's supply of milk and cream has been ving farther and farther away with the decreased receipts from near-by Massasetts, Connecticut, and southern New Hampshire. (See Exhibit E.) The reason this change was the cheaper production costs in the area farther from the market. e next change which is now taking place is tapping of Quebec, Canada, for milk d cream. This is undesirable for the reason that (1) it results in large areas of m land in New England, which should support dairy herds, growing up to brush

---

[2] Suggested reclassification and revision of sections of the tariff relating to agricultural products and visions, p. 13, par. 1, prepared by United States Tariff Commission.

and timber, with their owners moving to cities for employment; (2) it results in the obtaining of absolutely essential food products from a foreign country, where it is difficult to properly supervise the sanitary conditions of production.

A recent survey of conditions of dairying in New England and Quebec show that sanitary facilities for producing milk, such as ice houses and milk houses, are much less numerous in Quebec than in New England. This survey also showed that the standard of living in Quebec is lower than in New England when measured by the question as to whether or not the wife and daughters help milk and higher than in New England when measured by the question as to whether or not the house has conveniences such as running water, furnaces, and bathrooms. The presence of these latter conveniences indicates more profitable dairy production in Quebec than in New England. (See Exhibit F for details.)

From 1900 to 1920 the population of New England increased from 5,600,000 to 7,400,000, an increase of one-third, while during the same period the number of dairy cows decreased from 893,000 to 843,000, a decrease of 50,000 in 20 years. In 1910 there were 189,000 farms in New England, while in 1920 only 156,000 are reported, a decrease of 17 per cent in 10 years. There is a like decrease in the acres of improved land.

During the period from 1900 to 1919, the production of butter in Canada increased from 36,000,000 pounds to 104,000,000 pounds, and from 1917 to 1919 the number of cows supplying creameries increased from 1,102,000 to 1,648,000—Quebec increasing from 546,000 to 565,000, and Ontario from 445,000 to 747,000.

NEW ENGLAND MILK, CREAM, AND BUTTER SUPPLY.

Dairy products sold from New England farms in 1919 amounted to over $94,[illegible] 000. Milk and cream need to be produced near the point of consumption because of their perishable nature, and New England now produces sufficient of these dairy products to supply her needs without receipts from Canada. In 1919, when 41[illegible] gallons of cream were shipped from Canadian points to Boston, the butter produced in New England creameries would have provided 4,500,000 gallons of 36 per cent cream or eleven times the amount necessary to replace the Canadian shipments. (See Exhibit G.)

The turning of the cream now used for butter to supplying the sweet-cream trade can not be accomplished in a few days when a cream dealer buying in Canada finds himself short. With a sufficient knowledge of increased market demands for sweet cream, a New England producer now making sour cream or farm butter would care for his product better so as to supply sweet cream. The butter produced in New England would have supplied nine times the amount of cream needed to replace Canadian cream shipments to Boston for the month of shipment (June). This butter would have provided a large amount of additional milk if more milk had been needed.

IMPORTATIONS OF MILK, CREAM, AND BUTTER FROM CANADA TO UNITED STATES.

The importations of butter from Canada (United States Foreign and Domestic Commerce Report) increased from 351,000 pounds in 1913 to over 9,000,000 pounds in 1920, at the same time the Reports of the Trade of Canada (years ending March 31) report increases in the exports of milk from Canada to United States of from [illegible] gallons in 1913 to 1,500,000 gallons in 1921. During the same period the imports of cream from Canada increased from 800,000 gallons in 1913 to 1,300,000 gallons in 1921. Of this importation of milk and cream 94 per cent of it came from the Provinces of Quebec and Ontario through the Vermont and St. Lawrence customs districts. Due to the cheaper production costs in Canada, the excellent markets in New England are being lost to the New England producer. This has resulted in a decrease in number of farms and cows and general lack of prosperity in the dairy sections of New England. (See Exhibit H.)

TARIFF SCHEDULE DESIRED.

For the reasons already outlined in this brief we desire the following paragraphs to read:

"PAR. 707. Whole milk, sweet or sour, 3½ cents per gallon; cream, sweet or sour, having not more than 20 per cent of butter fat, 15 cents per gallon, for each additional 5 per cent or fraction thereof of butter fat 5 cents per gallon additional; skimmed milk, 1 cent per gallon; ice-cream mixtures, unfrozen, having not more than 15 per cent of butter fat, 15 cents per gallon, for each additional 5 per cent or fraction thereof of butter fat 5 cents per gallon additional; ice-cream mixtures, frozen, having not more than 15 per cent of butter fat, 9 cents per gallon, for each additional 5 per cent of butter fat 3 cents per gallon additional."

"PAR. 709. Butter, 10 cents per pound; oleomargarine, 10 cents per pound."

TARIFF SCHEDULES ON OTHER DAIRY PRODUCTS.

In conjunction with other dairy organizations in the United States who have will present facts to support rates desired, we ask that paragraphs 708 and 710 be ianged to read:

"PAR. 708. Milk, condensed or evaporated: In hermetically sealed containers, isweetened, 1 cent per pound; sweetened, 1½ cents per pound; all other, 1¾ cents r pound; whole-milk powder, 3½ cents per pound; cream powder, 8 cents per pound; id skimmed-milk powder, 1½ cents per pound; malted milk and compounds of or ibstitutes for milk or cream, 20 per cent ad valorem."

"PAR. 710. Cheese, valued at less than 30 cents per pound, 5 cents per pound; ilued at 30 cents or more per pound, 25 per cent ad valorem; cheese substitutes, 5 nts per pound; lactarine or casein, 4½ cents per pound [this article now appears on e free list]; all other dairy products not otherwise provided for, 20 per cent ad ilorem."

COMPOSITION OF THE NEW ENGLAND DAIRY TARIFF COMMITTEE.

The New England Dairy Tariff Committee represents the following farm organ- ations in New England: The Grange, the State farm bureaus, the State dairymen's sociations, the State departments of agriculture, the State agricultural colleges, id the New England Milk Producers' Association. The personnel of the committee as follows: W. N. Cady, Vermont State Grange, chairman; O. M. Camburn, director dairying, Massachusetts Department of Agriculture, secretary; J. W. Alsop, Con- cticut Dairymen's Association; H. N. Sawyer, New Hampshire State Farm Bureau; . D. Jones, Maine Agricultural College; G. R. Little, Eastern New York Milk Pro- icers; J. J. Dunn, Rhode Island State Department of Agriculture; and W. H. Bron- n, New England Milk Producers' Association.

EXHIBIT A.

RELATIVE COSTS, NEW ENGLAND AND CANADA.

Milk.—The duties on dairy products are based upon costs of producing milk the New England States and the Province of Quebec, as determined for the month April, 1921. Accordingly, the cost of producing milk in the New England States id the Province of Quebec was as follows:

	Per 100 pounds.	Per gallon.
w England States	$2.93	$0.252
ovince of Quebec	2.45	.211
Difference in favor of Quebec	.48	.041

Cream.—Based on these costs of 100 pounds of milk, the cost of producing 1 llon of 36 per cent cream is as follows:

ew England States	$2.04
ovince of Quebec	1.64
Difference in favor of Quebec	.40

Butter.—Based on these costs of 100 pounds of milk, the cost of producing 1 pound butter in these two areas is as follows:

ew England States	$0.55
ovince of Quebec	.45
Difference in favor of Quebec	.10

Transportation costs.—The transportation costs on dairy products from New England nters of production and Province of Quebec to Boston are as follows:

Freight charges on dairy products from centers of production to Boston, Mass.

	Milk.		Cream.		Butter per pound.
	Zone.	Per gallon.	Zone.	Per gallon.	
	Miles.		*Miles.*		
Province of Quebec	281–300	$0.0485	281–300	$0.0605	[illegible]
New England States	201–220	.0420	221–240	.0545	[illegible]
Difference in favor of New England		.0065		.0060	[illegible]

These differences in transportation costs which favor New England should be sub-tracted from the differences in costs as given above to obtain the tariff protection needed to offset differences in cost of production.

Method of obtaining costs.—The milk costs are based on the "Warren formula" for the quantities of feed and labor required to make 100 pounds of milk, to which have been applied feed and labor costs in the two areas. The Warren formula is used as a measure of cost of milk production, with the same quantity figures applied in each case, with the exception of "overhead" costs.

New England States cost per 100 pounds of milk (Apr. 15, 1921).

Grain, 33.79 pounds, at $41.20 per ton	$0.[illegible]
Hay, 43.3 pounds, at $21.40 per ton	[illegible]
Other dry forage, 10.8 pounds, at $10.60 per ton	[illegible]
Silage, 92.2 pounds, at $8 per ton	[illegible]
Other succulents, 8.3 pounds, at $8 per ton	[illegible]
Labor, 3.02 hours, at $0.235 per hour	[illegible]
Total (representing 79 per cent of cost)	[illegible]
Final cost, including overhead	[illegible]

Province of Quebec costs per 100 pounds of milk (Apr. 15, 1921).

[Expressed in Canadian money.]

Grain, 33.79 pounds, at $43 per ton	$0.[illegible]
Hay, 43.3 pounds, at $20 per ton	[illegible]
Other dry forage, 10.8 pounds, at $10 per ton	[illegible]
Silage, 92.2 pounds, at $6.40 per ton	[illegible]
Other succulents, 8.3 pounds, at $6.40 per ton	[illegible]
Labor, 3.02 hours, at $0.187 per hour	[illegible]
Total (representing 85 per cent of costs)	[illegible]
Final cost, including overhead	[illegible]

Sources of costs.—The prices for grain, hay, and labor in the two areas were ob-tained by surveys made during April in Canadian territory from which cream is shipped to the Boston market and from representative territory in the various New England States, supplemented by a more detailed cost of labor and prices charged for grain from a study made by the New England Milk Producers' Association.

Grain and hay.—Grain and hay prices in the Province of Quebec were somewhat higher than prices in the New England States, as the following comparison of prices will show:

Grain and hay prices.

Feed.	Quebec.	New England States.
Corn meal ... per 100 pounds	$2.60	[illegible]
Ground oats ... do	2.20	[illegible]
Linseed meal ... do	2.75	[illegible]
Wheat bran ... do	1.90	[illegible]
Clover hay ... per ton	20.00	[illegible]

Based on the above grain prices, the cost of a balanced ration in Quebec would be 2.15 per 100 pounds of grain and $2.06 in the New England States. The prices for ay in the New England States are from the Crop Reporter, published by the United tates Department of Agriculture, in which the prices for the different States are eighted on the basis of the importance of the dairy industry, as shown by the producon of milk reported by the United States census for 1920, for each State. These eights applied are as follows:

Milk production in New England.

[Fourteenth United States Census.]

	Quantity of milk.	Per cent.
	Gallons.	
ine	77,876,881	21
w Hampshire	42,356,285	11
rmont	122,095,734	34
ssachusetts	76,316,309	20
nnecticut	54,894,287	14
Total	373,539,496	100

Silage.—From cost accounts kept in the New England States by the various w England colleges it has been determined that the cost of producing silage is $8 r ton. As labor is the principal item in the cost of producing silage, and the labor ts in the Province of Quebec were found to be 20 per cent lower than the New gland States, the cost of silage in Quebec was figured at $6.40 per ton

Labor.—The results of the survey in the Province of Quebec showed that the rage cash wage paid farm labor in April, 1921, was $36 per month and the average t of board was estimated by farmers as $22. This makes the total cost of hired or in the Province of Quebec $58 per month. The farmers of Quebec estimated t their labor worked from 11 to 13 hours per day, which would give a total number hours worked per month of about 310. This gives a cost per hour of hired labor as 7 cents. Labor costs in the New England States are based on returns from some farmers scattered throughout the New England States, and the returns from the ividual States weighted upon the importance of the dairy industry. The weighted h wage paid per month for "month labor boarded" in the New England States $44. The estimated cost of board was $29, making a total of $73. The number hours worked was found to be 310 per month, which gives a cost per hour of labor 3.5 cents in New England.

ages paid farm labor have been consistently lower in Quebec than in the New gland States, as shown by the following table:

Cash wages paid per month for farm labor.[1]

	Quebec, Canada.[2]	Maine.	New Hampshire.	Vermont.	Massachusetts.	Connecticut.
	$14	$34	$36	$35	$37	$36
	12	26	25	26	25	23
	12	26	25	27	25	25
	15	29	29	30	30	30
	27	36	33	35	38	35
	28	46	42	43	43	44
	35	49	45	45	45	45
	40	57	55	52	55	56

uebec, from the Monthly Bulletin of Agricultural Statistics for February, 1920 and 1921, published by Dominion Bureau of Statistics. New England States, from the Monthly Crop Reporter, United States rtment of Agriculture.

Monthly cash farm wages in Quebec were arrived at by dividing the annual wages and board, reported ales, by 12 and subtracting therefrom the value of board. The price of board is reported as: 1910, $12; $13; 1915, $13; 1916, $16; 1917, $17; 1918, $20; 1919, $23; 1920, $24.

Results of investigation made by the New England Dairy Tariff Committee, 1921.

	Quebec.	Maine.	New Hampshire.	Vermont.	Massachusetts.	Connecticut
Cash	$36	$47	$53	$41	$42	[illegible]
Board	22	26	28	27	33	[illegible]
Total	58	73	81	68	75	[illegible]

Other costs.—The percentage of total costs represented in feed and labor is esti-mated at a larger amount in Quebec than in New England, for the reason that a study of housing, dairy equipment, and cow interest and depreciation charges show lower costs for these items in Canada than in New England. This study, made from the Boston (Mass.) dairy division, shows the following barn scores for representative areas in Quebec and the New England States, both of which have been shipping milk to Boston for the same period of time:

Barn scores—Vermont and Quebec.

Locality.	Number of farms scored.	Per cent of farms scoring under 50 per cent.	Range of score.	Average score of 70 farms.
Milton, Vt.[1]	70	21.43 (15 farms)	39-65	[illegible]
Hereford, Quebec [1]	70	52.85 (37 farms)	39.2-66	[illegible]
Shelburne, Vt.[2]	70	42.85 (30 farms)	31.7-64	[illegible]
Sutton, Quebec [2]	70	62.85 (44 farms)	26.9-60	[illegible]

[1] Old territory, shipping to Boston for some time.
[2] New territory, shipping to Boston only recently.

These barn scores indicate that the cost of housing cows and equipment for han-dling of dairy products is lower in Quebec than in the New England States. The survey of Canadian farms indicated a like condition.

Interest and depreciation on cows.—Another item of importance in the "other costs" is interest and depreciation on cows. According to the Dominion Monthly Bulletin of Agricultural Statistics for February, 1921 (p. 52), the average value per head of milch cows for 1920 in Quebec was $75. The weighted average value of milch cows for the New England States according to the United States Bureau of Crop Estimates, as published in the Crop Reporter, throughout the year 1920, was $10[illegible]; in other words, the interest and depreciation charges on cows in the Province of Quebec was approximately 75 per cent of what they were in the New England States.

Cream costs.—Cream costs were determined by subtracting the value of skim milk from the costs given for milk. The value of the skim milk is based on the value of one-half bushel of corn, which in corn meal for April 15, 1921, was 56 cents per hun-dredweight. This gives the value of skim milk (85 pounds in 100 pounds of milk) as 48 cents, which when subtracted from the cost of 100 pounds of milk gives the cost of 1.2 gallons of 36 per cent cream as $2.45 in New England and $1.97 in Quebec. The cost per gallon is $2.04 in New England and $1.64 in Quebec, a difference of 40 cents per gallon in favor of Quebec.

Butter costs.—In determining the butter costs, the value of skim milk is estimated per 100 pounds as being equal to the value of one-half bushel of corn, which in corn meal for April 15, 1921, was 56 cents per hundredweight. This gives the value of skim milk (85 pounds in 100 pounds of milk) as 48 cents, which when subtracted from the cost of 100 pounds of milk gives the cost of butter fat sufficient to make [illegible] pounds of butter, allowing for a 3.7 per cent milk and a 20 per cent churn as $2.45 in New England and $1.97 in Quebec. The cost per pound in New England is 55 cents and in Quebec 45 cents, a difference of 10 cents per pound in favor of Quebec.

EXHIBIT B.

RELATIVE COSTS, UNITED STATES AND DENMARK.

Items of cost.—The principal items entering into the cost of keeping a cow are feed, or, and overhead costs, including interest and depreciation on cow's housing, etc.)f these items, feed makes about 50 per cent, labor 30 per cent, and other costs ut 20 per cent of the total costs.

Feed.—The only costs of feed used in Denmark which are obtainable are quo-ions for cottonseed-oil cake, which quotations show prices to be about 7 per cent er in the United States than Denmark last summer and this spring.

Wholesale prices of 43 per cent cottonseed meal, per ton f. o. b.

[2] m the Crop Reporter, published by the U. S. Department of Agriculture.

rhead costs.—The only items obtainable of overhead costs are the average s of milch cows, but these prices given are not directly comparable for the reason the prices for cows quoted by the American consul in Denmark are largely for bred cows for export, a much better class of stock than those quoted in the Crop rter for the United States. A comparison of these prices indicates that cows in nark are valued about 30 per cent above their value in the United States.

Average price of milch cows per head.

Year.	Denmark.[1]	New England.[2]	Northern United States dairy section
1914	$83	$64	[illegible]

Labor	30	[illegible]
Overhead	20	[illegible]
Weighted costs	100	[illegible]

Exhibit C.

INCREASED PRICE LEVEL ON BUTTER REQUIRES HIGHER RATES.

Change in price level makes higher duty necessary to provide same protection.—Previous to 1890 the duty on butter had been in the main from 4 to 5 cents per pound. In that year a duty of 6 cents per pound was placed on butter. This was reduced [illegible] 4 cents in 1894 and again raised to 6 cents in 1897, at which point it remained [illegible] the Underwood tariff act in 1913 reduced the rate to 2½ cents per pound. In [illegible] the market price of butter was about 20 cents per pound. The chart[1] shows the [illegible] of prices of butter from 1897 to 1921. Judging from this trend, the price of [illegible] should settle for the year between 30 and 40 cents. Assuming that 6 cents a pound duty on butter was correct in 1897 (which can be assumed since it was not changed in 1909), when butter sold for 20 cents per pound, 10 cents per pound duty [illegible] required at present to give the same protection to butter producers as was given [illegible] 1897.

Exhibit D.

COMPARISON OF TARIFF RATES ON CREAM AND BUTTER AND THE PROFITS WHICH [illegible] BE MADE IN SHIPPING CREAM TO UNITED STATES TO BE MANUFACTURED OVER MANUFACTURING BUTTER IN CANADA FOR SALE IN UNITED STATES.

[Expressed in Canadian currency.]

After paying the duties now carried by the permanent tariff bill (pars. [illegible] 709, and 710) a Canadian creamery within 60 miles of the United States border [illegible] in September, 1921, have made $0.21 (United States money) per gallon more on shipping cream to the United States to be manufactured into butter than it could to manufacture the cream into butter in Canada and ship the same to the United States [illegible] sale.

The Province of Quebec produces 51 per cent of her butter within 60 miles [illegible] the United States border, while 80 per cent of Ontario butter is within this [illegible] These two Provinces produce 70 per cent of the butter manufactured in creameries [illegible]

[1] Omitted in printing.

anada. This comparison of costs demonstrates that the duty on heavy cream should increased to at least 31 cents per gallon to equalize with an 8-cent duty on butter.

The following shows the cost of operation and delivery at the United States order of 10 gallons of 50 per cent cream made into butter under the two following ethods:

Shipping the cream to a creamery in the United States and there having the itter manufactured and selling the same in the United States, paying duties of cents per gallon on the cream.

Manufacturing the cream into butter at a creamery in Canada and then shipping butter to the United States for sale, paying a duty of 8 cents per pound on the tter.

Summary.

thod No. 1:	
Gain on shipping heavy cream to United States, paying 10 cents per gallon duty and manufacturing such cream into butter here (per 10 gallons of cream)	$4.61
thod No. 2:	
Gain on manufacturing cream into butter in Canada and shipping butter to the United States for sale, paying duty of 8 cents per pound on the butter (per 10 gallons of cream)	2.29
Difference in favor of shipping cream to United States for manufacturing into butter here, paying cream duty, over manufacturing cream into butter in Canada shipping butter here, paying butter duty (per 10 gallons of cream)	2.32
Per gallon difference in favor of shipping cream, 0.232	.23
Difference expressed in United States dollars (divide by 109.5 per cent per gallon of cream)	.21

Items of cost.

ream.—Cream for butter purposes is purchased from the Canadian producers the flat quotation for finest creamery butter at Montreal. The average quotation this butter for September, 1921, was $0.36 per pound. (Trade Bulletin, Montreal.)

Station expense.—A charge of 50 per cent per can for station expense is made. This expense to cover the cost of receiving the cream from patrons, separating the same, and loading onto cars. There would be a residual item of skim milk which has not been considered here.

Can charge.—A charge of $0.03 per can is made to cover interest and depreciation on cans. This is the cost as reported by Boston milk dealers to the New England Federal Milk Commission. A 10-gallon jug costs new about $5.25 and will last about five years.

Freight.—Freight charges are taken from railroad traffic rates on cream for a 60-mile haul.

Duties.—Duties are figured at rates now carried for cream and butter in the permanent tariff bill; cream, over 30 per cent, 10 cents per gallon; butter, 8 cents per pound.

Cost of manufacturing butter.—A cost of 5 cents per pound in manufacturing butter is recognized by the trade generally, as also is the 20 per cent overrun on butter fat.

Selling price of butter in United States.—The average September quotation of the Boston Chamber of Commerce for creamery extras was $0.4383 per pound. Canadian currency averages 9½ per cent premium for the month of September.

Freight on butter.—Obtained from Boston & Maine Railroad schedules of freight rates.

EXHIBIT E.

HISTORY OF DAIRY INDUSTRY IN NEW ENGLAND AND CANADA.

Changes in source of Boston's milk supply.—During the past 20 years there has been a rapid moving back of the source of Boston's milk supply with decreased supply coming from near-by Massachusetts and southern New Hampshire, resulting in increased supply from Vermont and recently the starting of shipments from Canada and northern New York.

Importance of dairying to the New England farmer.—Dairying provides the main source of income for the New England farmer. In 1919 the total income from the sale of dairy products was over $94,000,000.

Receipts from sale of dairy products, New England States, 1919.

[Fourteenth United States Census.]

Maine	$15,541,[illegible]
New Hampshire	9,62[illegible]
Vermont	26,634,[illegible]
Massachusetts	24,27[illegible]
Connecticut	14,38[illegible]
Rhode Island	3,7[illegible]
Total, New England	94,240,[illegible]

New England farms.—Proper protection to the New England farmer would do considerable to offset the decline in the number of farms which has taken place during the past 10 years, which ranges from 11 per cent in Vermont to 24 per cent in New Hampshire.

Number of farms in New England.

Cows in New England.—The number of cows in New England have shown a ady decline up to the period of high war prices of 1915–16, at which time the patri- c appeal for greater production of agricultural products resulted in an increased mber of dairy cows. Below are given the number of cows and heifers over 2 years l by census periods:

Number of dairy cows and heifers over 2 years old.

[United States Census.]

	1900	1910 [1]	1920
ne	173,592	139,392	175,425

FERENCE IN STANDARD OF LIVING IN TERRITORY IN QUEBEC SUPPLYING BOSTON WITH DAIRY PRODUCTS AND COMPETING TERRITORY IN NEW ENGLAND STATES.

Women and children milking.—At the same time that the relative cost of feed and or was obtained for Quebec and for the New England States information was also ained as to the relative standard of living in the two sections. In general, one ld say that judged by the percentage of farms reporting modern conveniences in houses, such as running water, furnaces, musical instruments, bathrooms, etc., t the Quebec farmers were considerably ahead of the New England farmers. s, however, was offset by the fact that 50 per cent of the farms in Quebec territory orted that their wives did milking, while in New England only two States reported wife milking—Massachusetts, where 9 per cent of the farms reported this condition, h 11 per cent in New Hampshire. Again, in Quebec 20 per cent of the farms orted the daughter milked, while the only New England State reporting this con- ion was New Hampshire, where only one daughter helped with the milking; 42 cent of the sons under 18 were reported as doing milking in Quebec, and from 20 cent to 30 per cent of the same class of labor in the New England States. In gen- l, the size of the family ranged somewhat larger in Quebec than in New England tes, being 5.3 persons per farm in Quebec and from 3.4 in Maine to 4.8 in Vermont.

Sanitary conditions.—This survey brought out the fact that sanitary conditions of milk production were better in the New England States than in Quebec. The fact that 30 per cent of the Quebec farms surveyed reported ice houses and 50 per cent milk houses, while in New England States, on the farms surveyed, from 74 per cent in Massachusetts to 100 per cent in Maine and Vermont reported ice houses, while from 65 per cent in Massachusetts and 92 per cent in Vermont reported milk houses indicates better care of the dairy products in New England than in Quebec. In order to produce a good grade product and have it in wholesome condition when it reaches the market ice houses and milk houses are essential.

ton does not need Canadian milk and cream.—That Boston does not need the lian production to give an adequate supply of cream is shown by the fact that 19, according to the United States Department of Agriculture, 15,799,023 pounds

of butter was manufactured in the New England States, which, if needed to give additional cream to replace the Canadian supply, would have furnished 4,500,000 gallons of cream of 36 per cent butter fat, 11 times the amount required. Boston obtained its largest amount of cream from Quebec in June, when 72,000 gallons were shipped. The butter production in New England would have furnished 666,000 gallons of cream, or over nine times the amount required to replace the Canadian production.

Butter production (in pounds) in New England, 1919–20.

In addition to the butter manufactured in creameries, over 14,000,000 pounds of butter was manufactured and sold from New England farms in 1919, which supply could also largely be used to replace the Canadian cream supply. This would have given over 4,000,000 gallons of 36 per cent cream.

Butter made and sold from farms in New England States.

EXHIBIT H.

IMPORTATIONS OF MILK, CREAM, AND BUTTER FROM CANADA TO UNITED STATES.

The imports of fresh milk from Canada were low previous to 1913, when only 8,000 llons were imported, but have increased rapidly since that time, with fresh milk the free list, until in 1920 about 2,000,000 gallons were imported. During this riod cream has declined, due to the decrease in the duty on butter, which made it s profitable to buy cream for manufacture into butter in United States, and the nd of the industry changing from cream shipping to milk shipping.

Supplemental Brief.

The New England Dairy Tariff Committee begs leave to present some facts whi[illegible] should be taken into consideration in the framing of a tariff on milk, cream, a[illegible] butter. We believe that the United States producers of dairy products should [illegible] given protection equal to the difference in the cost of production between the Unit[illegible] States and competing foreign countries. The importance of the dairy industry [illegible] New England is shown by the fact that dairy products valued at over $94,000,0[illegible] were sold from New England farms in 1919.

The cost of production secured for the New England States and the Province [illegible] Quebec for the month of April show a difference at this time in favor of Quebec [illegible] 3½ cents per gallon for milk, 40 cents per gallon for cream, and 10 cents per pound [illegible] butter. It is confidently believed by the committee that the costs secured for [illegible] period are nearer together than in normal times, since the decline in the cost of lab[illegible] and feed is taking place near the industrial centers more rapidly than in the outly[illegible] districts. It was also evident, from the household conveniences found in the Canad[illegible] Province, that dairy farming has been more profitable there, due possibly to the m[illegible] general engagement of the wives and daughters in the milking and other dairy opera[illegible]tions in Quebec.

There has been a continuous decrease in the number of farms in operation and [illegible] number of cows in New England for 30 years. This is due to only one thing—u[illegible] attractive returns, often actual losses. That live-stock husbandry is necessary to [illegible] maintenance of fertility and to providing a market for roughages produced in Ne[illegible] England is undisputed. On a general scale dairying offers the only solution to th[illegible] problem.

The use of dairy products by the urban population is greatly below what it should b[illegible] This is due to two things, viz, lack of appreciation of their importance, and th[illegible] difficulty of securing a fresh, uniform, wholesome product from remote regions. Bus[illegible]ness men everywhere agree that without a prosperous and thriving agricultur[illegible] contented industrial class is impossible.

ORGANIZATION OF THE COMMITTEE.

As a result of unfavorable conditions existing in the dairy industry, which ha[illegible] been developing for the past 20 years, there was brought together a representativ[illegible] body at Boston on February 24, 1921, to consider a tariff on dairy products with [illegible] view to bringing these matters to the attention of the United States Congress. Repr[illegible]sentatives from practically all of the State Dairymen's Association, State departmen[illegible] of agriculture, State granges, and State agricultural colleges of the New Engla[illegible]

ates were present. In addition, the Eastern New York Milk Producers and the ew England Milk Producers' Association were represented.

As a result of the action taken at this meeting each State group selected a representative to carry out the necessary work of formulating a tariff schedule. This oup consists of W. N. Cady, Vermont State Grange, chairman; O. M. Camburn, assachusetts State Department of Agriculture, secretary; J. W. Alsop, Connecticut airyman's Association; H. N. Sawyer, New Hampshire Farm Bureau; M. D. Jones, aine Agricultural College; G. R. Little, Eastern New York Milk Producers; J. J. inn, Rhode Island State Department of Agriculture; and W. H. Bronson, New gland Milk Producers' Association.

THE SCHEDULE OF TARIFFS NEEDED.

For the protection of the dairy industry in New England the committee has formued the following minimum duties: For milk, 3½ cents per gallon; for cream, 35 its per gallon; for butter, 10 cents per pound.

DAIRY CONDITIONS.

In New England the number of farms as reported by the United States census ve shown a marked decline in each State for 20 years, ranging from 11 per cent Vermont to 24 per cent in New Hampshire since 1910. Up to the beginning of h prices for dairy products in 1915–16 the number of cows in New England had adily declined. Dairying is the main source of income to the New England mer. Adequate protection on dairy products would do considerable to bring iculture in New England back to a more prosperous condition.

COST OF PRODUCTION.

The cost of production of dairy products in the Province of Quebec is lower than in the New England States.

Milk.—The cost of producing 1 gallon of 3.7 per cent milk is $0.041 cheaper in Province of Quebec, Canada, than in the New England States. Transportation rges to Boston favor the New England producer to the amount of $0.0065 per lon, which when subtracted from the $0.041 leaves the difference in favor of Quebec 0.0345 per gallon.

Cream.—Based on these costs, the cost of producing 1 gallon of 36 per cent cream 0.40 per gallon less in Quebec than in New England. Transportation charges Boston is $0.006 per gallon less from the New England center of production than n the Quebec center of production, which when subtracted from the $0.40 leaves difference in favor of Quebec of $0.394 per gallon.

Butter.—Based on the costs of milk, the cost of producing 1 pound of butter is 10 ts less in Quebec than in New England. Transportation to Boston of butter n the center of production in New England is $0.0003 per pound less than from Quebec shipping point, which when subtracted from the 10 cents leaves the erence in favor of Quebec of $0.0997 per pound.

SPECIFIC DUTY DESIRABLE ON MILK, CREAM, AND BUTTER.

rom an administrative standpoint, and due to trade practices, a specific duty milk, cream, and butter is desirable.

n 1897, when butter sold for 20 cents per pound, a duty of 6 cents per pound was pted. At the present price level of butter, a duty of at least 10 cents per pound ld be necessary to give the same protection.

CANADIAN MILK AND CREAM NOT NECESSARY TO SUPPLY NEW ENGLAND NEEDS.

he New England farmer can supply New England's needs for milk and cream. 1919, when 416,000 gallons of cream were shipped from Canadian points to Boston, butter produced by New England creameries would have provided 4,500,000 lons of 36 per cent cream, or eleven times the amount necessary to replace the adian shipments.

he butter production in New England would have supplied nine times the amount ded to replace Canadian cream shipments to Boston for the month of heaviest pment (June). The butter would also have provided a large amount of additional k if more milk had been needed.

Butter imports from Canada have increased from 350,000 pounds in 1913 to over 00,000 pounds in 1920.

STANDARD OF LIVING.

The standard of living in Quebec is lower than in New England when measured by the question as to whether or not the wife and daughters help milk and higher than in New England when measured by the question as to whether or not the house has conveniences such as running water, furnaces, and bathrooms. The presence of these latter conveniences indicates more profitable dairy production in Quebec than in New England.

Sanitary facilities for producing milk such as ice houses and milk houses are much less numerous in Quebec than in New England.

TARIFF SCHEDULES ON OTHER PRODUCTS.

The dairy farmer deserves a protection which is as effective as that applied to other industries, in order to encourage and maintain an intelligent class in the production of this most essential product, and in the preservation of farms in a high state of fertility.

IMPORTED OILS A MENACE TO THE DAIRY INDUSTRY.

In recent years the consumption of oleomargarine has increased tremendously, and at present 1 pound is consumed to each 2 to 3 pounds of butter eaten. The importation of vegetable oils, used largely for this purpose, has increased from eighty-two and one-half millions of pounds in 1912 to seven hundred and eighty-one millions in 19[illegible] and four hundred and thirty-five millions in 1920. This has been an important factor in promoting losses to dairymen throughout the country, and it may have damaged materially the health of the Nation. The New England farmer desires to see adequate protection against these products.

THE IMPORTANCE OF MILK IN THE DIET.

Eminent scientists and health authorities now recognize milk and its products as the most nourishing of all foods in daily use. The vitamines, present in abundance, are essential to growth, health, reproduction, and longevity. These are supplied most abundantly in fresh milk produced near the consuming centers and from cows whose ration consists of green foods for a considerable portion of the year. In these respects New England products are superior to those of Canada as a source of vitamines.

STATEMENT OF CHARLES W. HOLMAN, REPRESENTING THE NATIONAL PRODUCERS' FEDERATION AND VEGETABLE OIL TARIFF COMMITTEE OF THE NATIONAL BOARD OF FARM ORGANIZATIONS.

Mr. HOLMAN. Mr. Chairman, on behalf of the Associated Dairymen of California, who can not have their office representative present, through our federation they wish to file a supplementary brief to the one which is of the hearings of November 14.

I am referring now to the former brief filed by the Associated Dairymen of California in respect primarily to casein and sugar of milk, in which they are asking for a duty of 4½ cents a pound on both those products, and their arguments to sustain them.

SUPPLEMENTAL BRIEF OF ASSOCIATED DAIRYMEN (INC.) OF CALIFORNIA.

The original brief and the argument and figures herewith submitted were prepared jointly by the Associated Dairymen of California (Inc.), a State-wide organization of dairymen and representing 10,000 dairymen of the State of California, and by the California Central Creameries, one of the very large manufacturing companies in the United States which produces one-sixth of the butter made in California, and has produced and is prepared to produce any of the known by-products of milk.

The Associated Dairymen of California undertakes to speak for 10,000 dairymen who own and control 17 manufacturing plants in the State.

The Associated Dairymen of California requested the assistance of the California Central Creameries in the preparation of the first brief and of this argument for the reason that the California Central Creameries owns and operates plants located in the extreme northwestern county of California, Del Norte, to the southeastern county of California, Imperial. Its manufacturing experiences and those of the units of the

ssociated Dairymen of California jointly give an accurate representation of the airy products manufacturing situation of the State.

Consideration of proper tariff rates is an economic problem and the facts and figures resented herewith are the combined results obtained from plants of various sizes, rge and small.

Tariff rates on milk products of whatever kind should have a definite relationip one to the other.

In the brief previously filed it is set forth that the duties proposed in H. R. 7456 the better known of the milk products resolve themselves into rates equivalent from 40 to 50 cents per hundred pounds of raw milk.

Thus the duty of 8 cents per pound proposed on butter is equivalent to 40 cents er hundred pounds of milk from which it is produced, assuming 4 per cent milk nd a production of 5 pounds of butter per hundredweight of milk. The dairy ganizations of the United States are asking for a duty of 10 cents a pound on butter, hich is the equivalent of 50 cents per hundredweight of milk.

The proposed duty of 5 cents per pound on cheese valued at less than 30 cents per ound is equivalent to a duty of 50 cents per hundred pounds on the milk used in s manufacture, assuming a production of 10 pounds of cheese to each hundredeight of milk used in its production.

Similarly the proposed duty on sweetened condensed milk, by H. R. 7456, is the quivalent of 28 cents per hundredweight of milk; and the proposed duty on unweetened evaporated milk is the equivalent of 43.6 per hundredweight on the ilk used in its manufacture.

But the rates of duty provided by H. R. 7456 for raw (whole) milk or for any other f the dairy products, have no relationship to the duties provided for butter, cheese, nd evaporated milk.

For instance a duty of 1 cent a gallon is provided for whole raw milk, which is the quivalent of 12 cents a hundredweight.

A duty of 5 cents a gallon is provided in H. R. 7456 for cream up to 30 per cent f butter fat, an equivalent of only 6 cents per hundredweight on raw milk.

A duty of 1½ cents per pound is provided in H. R. 7456 for skim-milk powder, the quivalent of 13½ cents per 100 pounds of milk.

Casein (lactarene) is placed on the free list by H. R. 7456. So, too, is sugar of milk.

It is to direct attention to these inequalities, and to ask for their adjustment that this tatement is offered.

DISPOSITION OF SKIM MILK.

After cream has been separated from milk by the usual mechanical process, there emains sweet skim milk.

The disposal of this sweet skim milk is to-day one of the problems of the dairy ndustry. It is too bulky and too low in value to be transported to the cities for eneal sales. In fact, it is disposed of by one of the four following methods:

First. It can be fed to hogs and other stock. A wasteful process of converting one good food into another and far less quantity of food.

Second. It can be converted into skim-milk powder. This industry is of recent origin in the United States, but it is a growing one. The skim-milk powder, carrying practically no fat, can be kept almost indefinitely. Baking companies everywhere are using it. To introduce it into general household use is the present problem of those manufacturing it. It is being produced on a large scale in New Zealand and Australia, and can be shipped to the United States more easily than butter, as it requires no refrigeration.

Theoretically, from 8½ to 9 pounds of powdered skim milk should be produced from 100 pounds of milk, but in actual practice the recovery is from 7 to 8 pounds.

Many States in the Union have produced skim-milk powder.

The United States production of skim milk powder in the calendar year 1920 was 41,893,000 pounds, of which California produced 7,348,000 pounds, or between 17 and 18 per cent.

In the first six months of 1921 the production in the United States was as follows:

	Pounds.
January	1,513,000
February	1,426,000
March	1,826,000
April	3,326,000

	Pounds.
May	4,430,000
June	4,370,000
Total	16,891,000

In the first six months of 1920 the production was 24,953,000 pounds.

Production has been decreased by the low price and, in California, inability to secure lower overland freight rates than are now charged.

Powdered skim milk is selling in the San Francisco market at from 8 to 9 cents a pound.

COST OF PRODUCTION.

We herewith submit the report of the Northern California Milk Producers' Association for the six months ending December 31, 1920:

5,092,400 pounds of skim milk, at 30 cents per 100	$15,2[illegible]
Manufacturing cost	25,169.91
Total	40,447.11

The production was 363,091 pounds of powdered milk and the cost was 11.14 cents per pound.

For the period beginning January 1 and ending September 30, 1921, the cost was as follows:

3,042,900 pounds of skim milk, at 30 cents per 100	$9,12[illegible]
Manufacturing cost	18,647.[illegible]
Total	27,776.[illegible]

The total yield was 216,959 pounds and the cost of production was 12.81 cents a pound.

The California Central Creameries report the following costs: For 1920, dry skim milk made, 5,119,907 pounds; average cost per pound, 11.57 cents. For 1921, dry skim milk made, 5,239,474 pounds; average cost per pound, 8.59 cents.

The reason for the apparent cheapness of production in 1921 is that the California Central Creameries estimated its skim milk value this year at 30 cents per hundred pounds.

Third. Skim milk can be used in the production of casein and sugar of milk, one process being the complement of the other. The process consists of coagulating the casein in skim milk by means of an acid. The casein is separated from the remaining whey, washed, dried, and ground, generally finding its market in New York and eastern centers.

There remains in the whey sugar of milk to the extent of perhaps 3½ per cent of sugar and some albumen. The albumen is utilized as chicken feed and need not be further considered in this relation. The whey is boiled down in vacuum pans in the manner used in sugar refineries and for some uses must be subsequently refined.

CALIFORNIA'S INTEREST PARAMOUNT.

California's interest in the sugar of milk and the casein industry is paramount to that of any State in the Union.

In the last three years California has produced 40 per cent of the casein made in the United States. In 1920 California produced nearly 50 per cent of all of the sugar of milk. The Milk Producers' Association and certain private creamery concerns, the largest of which is the California Central Creameries, have installed the necessary plant and equipment. At present the plants are practically idle.

The chief competitor in the casein markets is the Argentine Republic, as will be seen by the following table of imports of casein into the United States in the years 1919 and 1920:

From—	1920		1919	
	Pounds.	Value.	Pounds.	Value.
France	368,810	$44,989	1,036,303	[illegible]
Norway			551	[illegible]
United Kingdom	2,257,387	264,542	222,404	[illegible]
Canada	25	5	385	[illegible]
Argentina	17,300,983	1,970,639	15,528,199	[illegible]
Brazil	201,066	20,840	33,046	[illegible]
British India	250,872	29,651	200,057	[illegible]
Japan	3,137	500		
Australia	179,502	21,255	56,009	[illegible]
New Zealand	677,040	79,245		
Total	21,238,822	2,431,666	17,076,926	[illegible]

The imports of casein for the first nine months of 1921 were 7,978,393 pounds, valued at $742,225. The chief country of origin, as in previous years, was the Argentine Republic. Attention, however, is directed to the fact that imports from Australia and New Zealand are developing.

Compare these heavy receipts from abroad with the American production, which, according to the Bureau of Markets, was as follows:

Casein production, in pounds.

Year.	Total, United States.	California.
918	10,935,548	4,551,644
919	13,685,243	5,596,192
920	(1)	4,765,000

[1] Not complete.

We can not compete with the Argentine casein, which usually is of the poorest uality and which has been sold in New York as low as 6¼ cents per pound. We can ot compete for two reasons, the cost of production and much higher transportation harges.

TRANSPORTATION CHARGES.

On November 10, 1921, in response to an inquiry as to transportation costs of casein om Buenos Aires to New York, the Associated Dairymen of California received the llowing telegram from W. R. Grace & Co., of New York:

SSOCIATED DAIRYMEN OF CALIFORNIA,
San Francisco, Calif.:

Casein, Buenos Aires to New York, we have no steamers. Lamport & Holt quote and Munson Line $10 per long ton weight.

W. R. GRACE & CO.

Six dollars per long ton is equal to about 26.8 cents per hundred pounds; $10 per ng ton is equal to about 44.6 cents per hundred pounds.

On November 22, 1921, the Southern Pacific Co. quoted the following rates on casein, gar of milk, and powdered skim milk from San Francisco to New York:

Freight rates, San Francisco to New York.

	Per carload.	Less than carload.
in	$1.42 per 100 pounds, 30,000 pounds minimum.	$4.42 ground or powdered; $3.75½ other than ground or powdered.
k sugar	$3.08 per 100 pounds, 24,000 pounds minimum.	
dered milk	$1.05 per 100 pounds, 60,000 pounds minimum.	$4.42.
Do	$1.42 per 100 pounds, 40,000 pounds minimum.	

Ve have here a differential favoring Argentine producers between 26.8 cents per pounds and $1.42 per 100 pounds or slightly over $1.15 per 100 pounds.

f the provisions of H. R. 7456 are permitted to stand and casein is permitted to ne in free of duty, the casein industry of California, whch amounts to 40 per cent of American industry, is thus $1.15 per hundredweight worse off than under free le. Our market is in New York and New York draws from the world.

asein production is comparatively a new American industry. Its development in ifornia has been due to the desire of the milk producers' associations and to certain nufacturing concerns to provide a fairly profitable remedy for the waste of skim k. Casein finds its outlet in the manufacture of glues and varnishes. It has been planting celluloid in the arts and manufactures. All of the so-called "French ry" is made from it. It is used in the manufacture of buttons and, generally king, whenever bone and celluloid have been used.

Sugar of milk, as stated, is a companion product. It is used in various medi[illegible] preparations, and during the World War it was extensively bought by foreign Govern[illegible] ments, we are informed, for producing certain smoke screens.

Unless we have adequate protection there appears to be little hope for these [illegible] industries in the immediate future.

SUGAR OF MILK COSTS.

The California Central Creameries has made no sugar of milk in 1921.

In 1920 the California Central Creameries made 810,891 pounds at a cost of [illegible] cents per pound.

The Milk Producers of Central California, of Modesto, Calif., under date of N[illegible] ber 19, 1921, writes:

"When we were satisfied that there was no chance of making money out of sug[illegible] milk at this time, we shut the department down at the end of September. W[illegible] now washing out some crude left on hand and this will be finished in a day or [illegible] at which time all work in that department will cease.

"The cost of the by-products plants which are idle on account of low commo[illegible] prices is at least $75,000."

From March 1, 1920, to February 28, 1921, the Milk Producers' Association of C[illegible] California plant at Modesto produced 940,680 pounds of sugar of milk.

The financial statement for that period is as follows:

Total cost, average of 20.25 cents per pound		$190,4[illegible]
Total sales for the period		196,[illegible]
Less—		
Commission and brokerage	$3,940.31	
Delivery	1,881.12	
		5,[illegible]
Total net sales		190,4[illegible]

This plant was, therefore, run for the period of one year at a net loss of $55[illegible]

CASEIN COSTS.

During the year 1920 the California Central Creameries, operating eight ca[illegible] plants, produced as follows:

Production	pounds	1,6[illegible]
Yield	per cent	
Paid for milk, per 100 pounds	cents	[illegible]
Cost of manufacturing, per pound	do	[illegible]
Total cost per pound	do	[illegible]

For the first eight months of 1921 the California Central Creameries operated [illegible] plants at various times, but to-day has only two plants in operation. It report[illegible] follows for 1921:

Casein produced	pounds	[illegible]
Yield	per cent	
Valuing milk at 30 cents per hundred pounds; no sugar made	cents	[illegible]
Cost of manufacturing, per pound	do	[illegible]
Total cost per pound	do	

The Milk Producers of Central California makes the following report on manufa[illegible] of 1,221,204 pounds of casein from March 1, 1920, to February 28, 1921, a year [illegible]

Casein production	pounds	1,221,[illegible]
Yield casein	per cent	[illegible]
Apportion half of 47,016,354 pounds of skim milk, at 30 cents per hundred, to casein equals 15 cents per hundred; other half apportioned to sugar of milk manufacture		$70,[illegible]
Cost of manufacture		66,[illegible]
Total		138,[illegible]
Cost per pound	cents	[illegible]

This run is the largest made by any single factory in California. It was only posble because the Milk Producers' Association of Modesto had large sugar contracts on hich was hoped to realize but which hopes were not fulfilled.

To make a résumé of the above operations of the California Central Creameries and e Milk Producers' Association, we have the following:

	Year.	Casein.	Cost.
		Pounds.	
lifornia Central Creameries	1920	1,677,581	$259,521.78
Do.	1921	477,688	77,385.45
lk Producers of Central California	1920-21	1,221,204	138,725.62
Total	....	3,376,473	475,632.85

Average cost, 14.08 cents per pound.

Because California casein is of better quality than that of the Argentine, California oducers are receiving offers of 9 cents a pound for their casein in San Francisco. duty of 4½ cents per pound would raise the return to 13½ cents per pound, which ould enable at least the larger plants to operate.

Fourth. Skim milk may be emulsified with coconut oil, a pernicious practice which s developed to extensive proportions in the United States in recent years. So nulsified it is "filled" milk—in other words imitation milk—which despite all deals is being sold in the cities as "milk" and is being used in ice cream manufacture. is also evaporated and canned and is sold by retail grocers as "milk" despite the rasions of manufacturers to the contrary. It is an imitation that bids fair to spread erywhere if the wholly inadequate duty of 2 cents per pound on coconut oil which pears in H. R. 7456 is allowed to stand.

SOME OTHER CONSIDERATIONS.

H. R. 7456 provides for a duty on butter fat as "cream" of 5 cents per gallon, the uivalent of 8.6 cents per hundred pounds of milk. It provides for a duty of 1½ nts a pound on powdered skim milk, or the equivalent of 13.5 cents per hundred eight of milk. This is a combined duty of 22.1 cents per hundred pounds on the hole milk.

It is immaterial to the producers of Australia and New Zealand whether they market eir product as cream or powdered skim milk or as butter. It is feasible to ship eet cream under refrigeration from New Zealand to California. Skim milk powder n be shipped as any other imperishable goods. Freight rates and the rates of duty e the controlling factors.

The duty on cream plus the duty on powdered skim milk should be equivalent to e duty on butter or cheese calculated back to their equivalents in raw milk.

The dairy organizations of the United States are asking for a duty of 10 cents a pound n butter. This is the equivalent of 50 cents a hundred on milk.

The dairy organizations are asking for a duty of 15 cents a gallon on cream containing) per cent of fat and 5 cents per gallon additional for each 5 per cent of fat above 20 er cent of fat. Except for considerations of freight rates, this provision would lead) the importation of cream with a low percentage of fat. As H. R. 7456 draws a line f demarcation in tariff rates between cream lower and higher than 30 per cent fat, et the following calculation apply to cream containing 30 per cent of fat:

The dairy organizations thus propose a duty of 25 cents a gallon on 30 per cent cream. his is the equivalent of about 40 cents per 100 pounds for the milk from which this ream was separated.

The dairy organizations ask for a duty of 1 cent a gallon on skim milk, which is the quivalent of 12 cents per 100 pounds.

Thus the dairy organizations are asking for a duty on cream and skim milk equivalent n 52 cents a 100 pounds of whole milk.

It is proposed by the dairy organizations and in H. R. 7456 that the duty on powdered ailk shall be 1½ cents per pound. Assuming that the production of skim milk powder verages 8 pounds to the hundred weight this proposal is that ordinary skim milk nd skim milk powder shall pay exactly the same rate of duty.

This allows nothing in the way of protection for the manufacturer. The proposition, n short, is that duty shall be the same on raw material as on a manufactured product.

In all calculations in the foregoing, we have based the price of skim milk at 3 cents per 100 pounds, which we believe to be fair under average conditions in the United States.

For the reasons set forth we ask the following schedule of duties per pound:

	Cents
On skim milk powder	3
On casein	4
On sugar of milk	4

Also that the schedules on whole milk powder and cream powder provided in H. R. 7456 be changed to conform to the general proposition that they shall be equivalent to 50 cents per 100 pounds on the raw milk from which they are made.

Mr. HOLMAN. I will state further that the officers of the National Milk Producers' Federation have decided to ask that paragraph 71 of the bill be extended, in line with our former request of November 14, to include sugar of milk at 4½ cents a pound.

On behalf of Mr. W. W. Hovey, general manager, Dairymen's League (Inc.), and Dairymen's League Cooperative Association (Inc.), Utica, N. Y., who is unable to be here to-day, I am filing brief which has been sent me, dealing primarily with the manufacturing costs of the 10 milk commodities which occur in the paragraphs.

BRIEF OF W. W. HOVEY, REPRESENTING DAIRYMEN'S LEAGUE (INC.) AND DAIRYMEN'S LEAGUE COOPERATIVE ASSOCIATION (INC.), UTICA, N. Y.

These two associations represent 80,000 actual milk producers, with a total of approximately 1,000,000 dairy cows, throughout the State of New York and parts of the States of Pennsylvania, New Jersey, Massachusetts, Connecticut, and Vermont.

It is respectfully urged that the following duties be provided:

Whole milk, sweet or sour, 3½ cents per gallon.

Cream, sweet or sour, having not more than 20 per cent of butter fat, 15 cents per gallon; for each additional 5 per cent or fraction thereof of butter fat, 5 cents per gallon additional.

Skim milk, 1 cent per gallon.

Ice-cream mixtures, unfrozen, having not more than 15 per cent of butter fat, cents per gallon; for each additional 5 per cent or fraction thereof of butter fat, cents per gallon additional; frozen, having not more than 15 per cent of butter fat, 9 cents per gallon; for each additional 5 per cent or fraction thereof of butter fat, 3 cent per gallon additional.

Milk, condensed or evaporated, in hermetically sealed containers, unsweetened, 1 cent per pound; sweetened, 1½ cents per pound; all other, 1½ cents per pound.

Whole milk powder, 3½ cents per pound.

Cream powder, 8 cents per pound.

Skimmed milk powder, 1½ cents per pound.

Malted milk and compounds of, or substitutes for milk or cream, 20 per cent ad valorem.

Butter, 10 cents per pound.

Butter substitutes 10 cents per pound.

Cheese, valued at less than 30 cents per pound, 5 cents per pound; valued at cents or more per pound, 25 per cent ad valorem.

Cheese substitutes, 5 cents per pound.

Lactarene or casein, 4½ cents per pound.

Sugar of milk, 4½ cents per pound.

All dairy products not otherwise provided for, 20 per cent ad valorem.

In comparison with the Fordney bill (H. R. 7456), there are requested increased rates on whole milk, cream, whole-milk powder, butter and oleomargarine; and additions of rates on ice-cream mixtures, lactarene or casein, sugar of milk, and all dairy products not otherwise provided for.

This country is more than able to sustain itself, so far as dairy products are concerned, making unnecessary the importation of such products from foreign countries. Furthermore, in order to assist the producer to secure fair prices for milk and products, it is necessary to provide sufficient tariff protection to at least offset the differences in the cost of production between this and foreign countries. An ample supply of domestic milk and milk products should always be available and the ret

the producers should not be so lowered by foreign competition as seriously to affect
e industry and to make the production of milk unprofitable.

Shipments of butter arriving into this country from Denmark, Holland, Argentina, nada, and New Zealand have had the effect of depressing the prices on the New rk market all out of proportion to the amount of butter received, and such depres-ns have been reflected back to the producer to a much greater extent and for much ger periods than similar receipts of domestic products would bring about. This dition should be prevented and no such opportunity should be allowed where price of butter could be manipulated to the disadvantage of the entire dairy lustry.

There are a number of manufacturing plants just on this side of the American border which cream or milk produced in Canada can be economically transported and de into products. This condition makes very necessary the increases in duties ght on milk, cream, and other products on a basis equal to that provided for butter.

Testimony already has been presented by witnesses showing that much lower costs production in foreign countries and the increase in the price level make necessary advance in the import duties on butter to 10 cents per pound and that milk, cream, l other products be placed on a basis equivalent to 10 cents per pound on butter, in er that the interests of the dairy farmer of this country may be protected ade-tely. This basis has been extended to milk and cream, and you have been shown t 3½ cents per gallon on whole milk, sweet or sour, and 15 cents per gallon on cream, et or sour, having not more than 20 per cent of butter fat, with an additional 5 cents gallon for each additional 5 per cent of butter fat, are necessary. Testimony also been, or will be presented, showing the necessity of 4½ cents per pound on casein actarene, and 4½ cents per pound on sugar of milk.

ontinuing this method of computing physical equivalents, to the other products, following data are presented:

ne hundred pounds of milk, containing 3.5 per cent butter fat, will produce approx-tely the following:

	Pounds.
weetened evaporated or condensed milk	[1] 40
etened condensed	[1] 39
ole-milk powder	[1] 12½
am powder, 4.8 pounds, and skimmed-milk powder	7.6
ese	9.4

o equal the rate of 3½ cents per gallon on milk with a butter-fat content of 3.5 per t, which would equal 41 cents per 100 pounds, the above commodities would require following rates based on a butter-fat basis only. These rates should be increased, ever, for reasons provided in the next paragraph: Unsweetened evaporated and densed milk, 1 cent per pound; sweetened condensed, 1 cent per pound; whole k powder, 3.3 cents per pound; cream powder, 8 cents per pound; cheese, 4.4 ts per pound

o manufacture the 39 pounds of sweetened condensed milk it would also require pounds of sugar and as the import rate in the Fordney bill on sugar is $1\frac{1}{16}$ cents pound, the rate on 16 pounds would be 17 or 0.44 cent per pound of sweetened con-sed milk, which added to the above 1 cent would raise the rate on sweetened densed to 1.44 cents. Additional processes of manufacturing and packing this cle involve such additional costs as should put duties on a basis of 1½ cents per nd.

ne hundred pounds of skimmed milk will yield about 3½ pounds of dried casein or ut [2] 8.2 pounds of skimmed-milk powder. As much skim milk is run away because o market or profitable utilization, duties of 4½ cents per pound on casein and 1½ ts per pound on skimmed-milk powder are requested so as to prevent these articles n foreign countries coming into this country and competing with our skimmed milk ch a way as to cause this domestic product to be thrown away.

ne hundred gallons of an average unfrozen ice-cream mixture with 12 per cent ter fat contains approximately 516 pounds of milk, 207 pounds of 40 per cent cream, pounds of condensed milk, and 120 pounds of sugar, which at the proposed duties ld be, respectively, $2.12, $8.75, $1.87, and $1.28, or a total of $14 per 100 gallons, or cents per gallon. Additional allowances for higher costs of manufacturing in this ntry as against foreign countries will be sufficient to justify a duty of 15 cents

---

[1] uthority: United States Tariff Commission.
[2] uthority: United States Tariff Commission. Suggested reclassification and revision of sections of the l relating to agricultural products and provisions.

per gallon on ice-cream mixtures containing up to 15 per cent butter fat. For ea additional 5 per cent of butter fat or fraction thereof an additional 5 cents per gal should be provided, the same as for cream when containing in excess of the ba amount of butter fat. Because of the swell of frozen ice-cream mixtures they shou take only 60 per cent of the duties provided on unfrozen mixtures, which would 9 cents per gallon on such mixtures containing up to 15 per cent of butter fat with additional 3 cents per gallon for each 5 per cent of butter fat or fraction thereof.

DEFINITIONS.

The United States Department of Agriculture has promulgated the following defi tions:

Condensed milk, evaporated milk, concentrated milk, is the product resu from the evaporation of a considerable portion of the water from the whole, fre clean lacteal secretion obtained by the complete milking of one or more healthy co properly fed and kept, excluding that obtained within 15 days before and 10 da after calving, and contains, all tolerances being allowed for, not less than 25.5 p cent of total solids and not less than 7.8 per cent of milk fat.

Sweetened condensed milk, sweetened evaporated milk, sweetened concentra milk, is the product resulting from the evaporation of a considerable portion of water from the whole, fresh, clean lacteal secretion obtained by the complete milk of one or more healthy cows, properly fed and kept, excluding that obtained wit 15 days before and 10 days after calving, to which sugar (sucrose) has been added contains, all tolerances being allowed for, not less than 28 per cent of total milk so and not less than 8 per cent of milk fat.

Condensed skimmed milk, evaporated skimmed milk, concentrated skimmed m is the product resulting from the evaporation of a considerable portion of the w from skimmed milk, and contains, all tolerances being allowed for, not less tha per cent of milk solids.

Sweetened condensed skimmed milk, sweetened evaporated skimmed m sweetened concentrated skimmed milk, is the product resulting from the eva tion of a considerable portion of the water from skimmed milk to which sugar (suc has been added. It contains, all tolerances being allowed for, not less than 2 cent of milk solids.

Dried milk is the product resulting from the removal of water from milk, and c tains, all tolerances being allowed for, not less than 26 per cent of milk fat and more than 5 per cent of moisture.

Dried skimmed milk is the product resulting from the removal of water f skimmed milk, and contains, all tolerances being allowed for, not more than 5 per c of moisture.

Malted milk is the product made by combining whole milk with the liquid separ from a mash of ground barley malt and wheat flour, with or without the additi sodium chlorid, sodium bicarbonate, and potassium bicarbonate, in such a ma as to secure the full enzymic action of the malt extract, and by removing water resulting product contains not less than 7.5 per cent of butter fat and not more t 3.5 per cent of moisture.

STATEMENT OF R. W. BALDERSTON, SECRETARY OF INTERSTA MILK PRODUCERS' ASSOCIATION, PHILADELPHIA, PA.

Mr. BALDERSTON. I am also appearing to-day in behalf of Philadelphia Interstate Dairy Council and the Pennsylvania St Dairy Council, which represent the allied dairy interests of Penn vania, New Jersey, Delaware, and Maryland.

Senator SMOOT. Briefly, what are you asking for?

Mr. BALDERSTON. I am also appearing here as chairman of Middle Atlantic Dairy Tariff Committee, cooperating with National Milk Producers' Federation, comprising the States of N York, Pennsylvania, Delaware, Maryland; and I am speaking rectly for the first group, representing 110,000 individual milk p ducers who are members of these organizations, too.

I want, Mr. Chairman, to file a brief, but I also have some infor tion which has come to me to-day and which is apropos of the

quest which we are making, namely, that the tariff on butter be 10 cents a pound and other dairy products in direct relationship with this tariff at the 10 cents a pound on butter.

I have here a letter just received from Mr. H. C. Taylor, who is Chief of the Bureau on Markets and Crop Estimates of the United States Department of Agriculture. I will file it, but I want to read one paragraph which introduces the subject which I want to treat of verbally [reading]:

On September 19 a cablegram was sent by one of the representatives of this bureau n London, stating that the British Government then held stocks of butter amounting o 90,000,000 pounds, and that Denmark was at that time booking orders for butter in he United States some weeks in advance. Since that time "Government butter" as moved very slowly on the market.

It is on account of this that we are filing at the present time, as well s on account of the fact that the present tariff is not sufficient to over the case, so that we are having these large importations of foreign utter.

WASHINGTON, *December 24, 1921.*

Mr. CHARLES W. HOLMAN,
Executive Secretary, National Milk Producers Federation.

DEAR MR. HOLMAN: Your request for information regarding the European dairy tuation as it may effect our market has been received. In addition to the information suggested in our recent conversation, some statistics of comparative prices have een compiled and charted in a form that may be of value to you.

On September 19 a cablegram was sent by one of the representatives of this bureau n London, stating that the British Government then held stocks of butter amounting o 90,000,000 pounds, and that Denmark was at that time booking orders for butter n the United States some weeks in advance. Since that time "Government butter" as moved very slowly on the market.

It should be explained that the Government stocks referred to are not a recent acquisition, but represent part of the quantity purchased from the Dominions under contract prior to decontrol of the trade in imported butter on March 31, 1921, and remaining undisposed of at that date. It was known generally that the British Government held a large surplus of butter at the time of decontrol, but the quantity as not definitely made known and was variously estimated by the trade at anywhere from 100,000,000 pounds to 200,000,000 pounds. This uncertainty as to the quantity held and the disposition to be made of it, hung over the British butter market as a depressing influence, contributing to the decline in price in April until the abrupt rise in July, when European production fell off, due to season and drought. Until that time the 1921 imports of butter into the United Kingdom had been on a prewar basis. During the first six months there were imported 240,000,000 pounds, as compared with 118,000,000 pounds during the corresponding period in 1920, and 233,000,000 pounds in the first six months of 1913. Consumption did not keep pace with this increased supply and the British market was glutted.

The inclosed graph indicates the average of weekly quotations of butter in Copenhagen, London, and New York, calculated on the basis of prevailing rates of exchange in Copenhagen on London and New York during the months since exports from Denmark to the United States began. It is of value simply as showing the trend of price levels in the three markets in relation to the trend of the imports of Danish butter y the United States. The imports as officially reported follow naturally at some interval of time the price situation and without regularity from month to month. In trend, however, the imports are seen to have come during 1919 and 1921, when the New York price level was relatively higher than the London price level, based in both cases on what the Dane could realize on his butter in terms of his own currency. When in 1921 the 6 cents tariff became operative and at the same time more could be realized in the London market, the United States received for a time practically no Danish butter. During the last half of the year an abrupt rise in prices, due to widespread drought, emphasized the weakness of the English market and the greater buying power of the United States, with the result that Danish exports to the United States were renewed.

During November, 581,029 pounds were received from Denmark, making a total for the 11 months of 1921 of 11,565,442 pounds as compared with 16,769,077 pounds

during the corresponding period last year and the 19,934,547 pounds for the en... year 1920. Butter imports from Canada during November were 823,612 pou... from Australia 421,246 pounds, and from New Zealand 11,200 pounds.

The situation suggests that Danish exporters are simply keeping open channe... trade that will make it possible to take advantage of the most profitable mark... any time. The same is true in a general way of exporters in the other countr... A similar study of prices indicates that New York prices for comparable grad... butter have in recent months been higher than the quotations in the London ma... for New Zealand and Australian butter.

In Australia and New Zealand at present, as in the United States, dairying ... relatively profitable, owing in those countries to low prices of meat relative to da... products.

It is true also that New Zealand and Canadian dairy interests are consciou... virtual monopoly of the English cheese market, the two countries together furnis... 90 per cent of the total cheese imports of the United Kingdom. The New Zea... Dairyman has seriously suggested the possibility recently of limiting cheese pr... tion in New Zealand in order to force cheese prices higher in the English mar... The policy suggested is that the factories having facilities for producing either but... or cheese turn early in the season (our early fall) to the production of butter ... until the report of lessened production of cheese had affected the prices ... In order to stimulate the British cheese market, New Zealand dairy interest... sufficiently organized, might conceivably export butter to the United State... increase their butter exports to England in order to limit the supply of cheese on the British market.

The degree to which the comparatively small shipments of foreign dairy prod... coming onto our markets may unduly affect prices is a matter that has not ... been given adequate study. It is planned, as you know, that through our organ... tion the effects of biased and inaccurate foreign market news may be as far as poss... eliminated. I am sure that you will avail yourself of any such service as we ma... able to offer.

Very truly, yours,

H. C. Taylor, *Chief of Bureau.*

Mr. Balderston. A trainload of Australian butter, compris... 300,000 pounds, is en route from San Francisco to New York, hav... ing left San Francisco on the 29th. This steamer load, compris... $1,100,000 worth of butter, reached a western port December 2... The Danish ship *Fredericka VIII* is en route to this country wi... a large shipment of butter. The amount of butter which has co... into this country in the last two months has been about 2,000,... pounds per month, of which over one-fourth has come from Den... mark. This is in direct support of what Mr. Loomis has just t... you about the inefficient way in which the tariff is dealing wi... this situation.

Senator Smoot. What is the export per month for butter?

Mr. Balderston. I do not have it just here, for these last tw... months.

I was going on to say there is a sufficient amount of butter pro... duced in this country to supply the domestic needs and leave ... small exportable surplus.

Senator Jones. You mean by that that there is sufficient supp... to meet the demand at the prices which the consumer must pa... now, do you not?

Mr. Balderston. There will be during the next few months ... sufficient amount, as I understand, of butter produced in this coun... try to meet all domestic demands.

Senator Jones. What was butter selling for before the war?

Mr. Balderston. In May of the present year the price got do... to 28 cents, which was the prewar basis.

I see what you are driving at, Senator; you are intimating tha... if the price is lowered, that we can then, of course, lower the pr...

o the American consumer. You all know that the American lairy farmers——

Senator SMOOT (interposing). I was wondering why you were sking more than 8 cents here now when your exports are over 50 er cent of what your imports are?

Mr. BALDERSTON. For the simple reason that we object——

Senator SMOOT (interposing). To any other coming in?

Mr. BALDERSTON. To being a dumping ground for butter from ther countries which want to flood this country at times when it uits them with surpluses which they can not sell in their regular narkets.

Senator SMOOT. They do not sell to countries that you export to.

Mr. BALDERSTON. I was in Denmark in June, 1920, and through he courtesy of the American consul I interviewed the leading Danish dairy specialists and marketing specialists.

They regard England as their legitimate market for their bacon and heir butter, which is the combination on which their agriculture s based. But when the English market is in such shape they do not want to demoralize it as it is now, then they send to this country their surplus.

I have here a chart which was obtained from the Department of Commerce, and which I will file, which shows that at the present time the price of butter in Copenhagen is the same as in New York, but they are willing to send it over here so as to support their own markets, which they had before the war and which they want to keep to themselves.

Senator MCCUMBER. Where do we export our butter to?

Mr. BALDERSTON. I do not know just at the present time.

Senator MCCUMBER. What character of butter is it that is compared with the butter that is consumed in the United States; is it of the same high standard, the export butter?

Mr. BALDERSTON. I am not qualified as an exporter of butter, Mr. Chairman.

Senator MCCUMBER. Do you know whether it is sold for a considerably less price than what it is sold for locally?

Mr. BALDERSTON. I do not. I want to refer next to the comparison of the Danish cost of production as compared with the American cost of production.

We have here, and I will file with you a comparison of the cost of production in Denmark as compared with the cost of producing milk and butter in Minnesota, which is in the center of the big butter-producing area, which shows there is a difference of 14 cents, or was last summer, operating at the same time in favor of the Danish farm.

Senator DILLINGHAM. On a pound of butter.

Mr. BALDERSTON. On a pound of butter. The Danish farmer, as I saw him in his dairy practice, imports quantities of cheap labor from Poland and neighboring countries, in which whole families come over to work in groups and to help harvest roots, hay, and grain.

They also have the most wonderful dairy climate in the world.

Senator MCCUMBER. There is something about this dairy business that I do not understand. You export the most to Great Britain. Denmark is only across the channel from the United Kingdom, and I can not understand how we can be exporting to Great Britain and

at the same time Denmark is also importing to Great Britain and exporting to the United States as well.

Senator JONES. I will say that is not the fact for the year 1921. For 10 months of 1921 we exported 700,000 pounds and only 65,000 pounds of that went to the United Kingdom. There went to Canada 1,904,000 pounds and to Panama 602,000 pounds, to Mexico 989,000 pounds, to Cuba 594,000 pounds, to Haiti 370,000 pounds, other West Indies 1,327,000 pounds, to South America 403,000 pounds, to the Philippine Islands 212,000 pounds, and to other countries 629,000 pounds.

The exports decreased considerably during 10 months this year compared with two previous years.

In 1920, for the first 10 months we exported 16,676,000 pounds; for 1919 we exported 29,687,000 pounds.

Senator MCCUMBER. I had assumed we had got back something near to normal conditions; for instance, going back into 1919, we exported to the United Kingdom, 19,483,348 pounds. That was during the first 10 months of 1919. It fell off to 65,000, as the Senator says, for the first 10 months of 1921.

Mr. BALDERSTON. The Danes have come back into their market again, and also the Australians, and to some extent I think the shipments from Argentina. The Danes in 1919 had reduced their production of dairy products very materially because they had not been able during the war to get American concentrates.

Senator JONES. Is there a tariff on butter in Canada?

Mr. BALDERSTON. I do not know.

Senator JONES. I see that we exported to Canada in the first 10 months of this year 1,904,000 pounds.

Senator DILLINGHAM. Senator, I have a recollection that statistics in the past have shown that about 5 per cent of all the dairy products in Canada were produced in the Province of Quebec. We get that product in New England under the present tariff. The rest of Canada is not given to dairying as is the old Province of Quebec.

Mr. BALDERSTON. There is an interchange back and forth across the border which takes up a good deal of the import and export figures.

I want next to simply refer briefly to the fact that in the State of Pennsylvania, in the year 1920, the census shows a total of 1,247,000 dairy cows, but the census of 1910 showed 1,421,000, or a total loss in dairy cattle during those 10 years of 174,000 dairy cows; and this is in spite of the fact that at the same time the population of the State has increased from 7,665,000 to 8,720,000.

Senator JONES. What is the wholesale price of butter here in the city of Washington?

Mr. BALDERSTON. I come from Philadelphia. The average price this week in Philadelphia for print butter of the kind which I suppose Senator Smoot would buy, was 56 cents wholesale, or the price to the retailer. That was the highest price I have heard of local creamery butter.

Senator SMOOT. The wholesale price of 56 cents?

Mr. BALDERSTON. The wholesale price of 56 cents to the retailer of a local creamery. That was our extreme high price received by a local creamery.

Senator JONES. What was that price before the war?

Mr. BALDERSTON. That price before the war was about 45 or 50 nts. That is the reason why I hesitate to give you exact figures, thout having the figures to go by. I do not have them here by . The price of butter is perhaps, if my memory serves me right, 2 per cent of the average of the five prewar years. If I am not rect, somebody please correct me. That is my recollection as ken from the United States Department of Agriculture statistics.

I simply want to refer to a brief which I have here showing the at increase in the dairy production in Argentina, and this schedule l be filled. It shows that there was something like seven times amount of butter produced for export and exported in 1920 than re was in 1910. In 1910 the total was 6,342,000; in 1920, 11 months ly. 37,700,000.

Senator JONES. Do you think that the wholesale price of butter in iladelphia ought to be maintained at 56 cents a pound or above?

Mr. BALDERSTON. I hold this, that the present production cost, ich I have here and which will be filed with you, as given by the ite College of Pennsylvania, New Jersey, and Maryland, would ke the price of butter at the present time 65 to 70 cents a pound. The cost of production in Minnesota, which I have from the State lege there, would show about 56 cents as the cost of producing it. You are all aware that the freight rates on butter from Denmark 1 cent a pound, unrefrigerated, or 1¾ cents in refrigerator vessels. e and three-fourths cents is the total freight rate in Minnesota in rload lots. Small creameries ship to New York and Philadelphia less than carload at 2¾ cents per pound. So that the argument is favor of the Danish farmer.

In Denmark they have innumerable little harbors, so that the llection of butter for export is very cheap. Little vessels go in most to every farm, or within a very few miles, so that the collect- g cost is not as great as it is in this country. They have small ms closely located, with large dairies on them. So that a small amery will not have to collect its cream or milk more than 2 or 3 les in any one direction in Denmark. This is not so in this country, ere many miles must be covered by wagon route in collecting milk cream.

Senator JONES. Is there exported from the United States to those untries a considerable quantity of feed for the dairy herds?

Mr. BALDERSTON. Before the war Denmark received large quanti- s of American concentrates, by-product feeds. They received bran some extent, but they were very fond of American cottonseed oil eal and linseed oil cakes.

During the war they could not receive this, and they learned to ow large quantities of peas; and they told me last year when I was ere that they did not expect for the future to be as dependent on merican feeds as they had been. However, they can receive, rough low ocean freights, from ports like New Orleans and Phila- lphia—New Orleans for cottonseed meal and Philadelphia for lin- ed oil cakes—their feeds very cheaply, due to the low freight rates. big firm in Philadelphia before the war exported linseed cake to enmark and Holland. At the present time it is hunting an Ameri- n market among Pennsylvania farmers for its product, because ere is not the same demand abroad.

The Danish leaders also tell me that they expected, when [illegible] was reestablished, to be able to obtain from Russia, which is [illegible] near at hand, quantities of these feeds, so as not to have to buy [illegible] American producers.

Senator WATSON. Can you not file anything else you have?

Mr. BALDERSTON. So far as I am concerned, Senator, I am through and I will file my brief and thank you for the attention this day.

BRIEF OF R. W. BALDERSTON, REPRESENTING INTERSTATE MILK PRODUCERS' ASSOCIATION.

The members of the Interstate Milk Producers' Association, who number [illegible] and who live in Pennsylvania, New Jersey, Delaware, and Maryland, have a [illegible] interest tha there shall be adequate protection for dairy products guaranteed [illegible] through pending tariff legislation. Labor and other miscellaneous costs which [illegible] up about one-half of the total costs of producing milk are as high within our [illegible] the country as perhaps anywhere in the United States, because of close [illegible] the great industrial areas centering around Philadelphia and Pittsburgh, [illegible] costs are much higher than formerly because of high transportation costs from the [illegible] growing sections in the West.

The number of dairy cattle on Pennsylvania farms has been gradually [illegible] as is shown by a comparison of the United States census of 1920, as compared [illegible] that of 1910, as follows:

	1920	19[illegible]
Calves up to 1 year	209,325	[illegible]
Heifers 1 year to 2 years	163,908	[illegible]
Cows 2 years old and upward	874,204	[illegible]
Total	1,247,437	[illegible]

Total loss in ten years 174,518.

During the same period, the population of Pennsylvania has been increased [illegible] 7,665,111 to 8,720,017 according to the same authority. The decrease in the [illegible] portion of cows to population is, in general, approximately the same for the ad[illegible] States of New Jersey, Delaware, and Maryland. This would indicate that [illegible] our Middle Atlantic States have a soil and climate unsurpassed for dairying [illegible] has been a movement toward restriction in the amount of dairy business [illegible] our farms, because our labor could be more profitably employed in those ind[illegible] near at hand which have had a fuller measure of protection for their markets [illegible] Exhibits A, B, C, D, and E, attached.)

Our eastern markets can receive dairy products with cheaper transportation [illegible] Canada than from the western part of the United States. All through the [illegible] mer and autumn a carload of Canadian cream came into Philadelphia each [illegible] The cost of producing this cream in Canada has been given you already in [illegible] tics compiled for the New England Dairy Tariff Committee. Canadian cre[illegible] approximately 40 cents per gallon less than the cost of producing cream in [illegible] sylvania. This cream can be sold in Philadelphia so cheaply that it pra[illegible] makes the market price for cream in Philadelphia.

TARIFF ON VEGETABLE OILS.

We would further ask that whatever figure is decided upon by Congress, [illegible] proper tariff tax on butter, be applied to vegetable oils to be used for human [illegible] The use of coconut oil as a substitute for butter fat has increased to an alarm[illegible] gree, as has been shown your committee by others who have appeared before [illegible] and need not be entered into here. A compound of skim milk and cocon[illegible] being manufactured in large quantities and sold in direct competition with [illegible] products, in the form of imitation or bogus evaporated milk and as imitation [illegible] and ice cream. We hold that it will undo the whole scheme of protective [illegible] this principle is not strictly adhered to.

CASEIN.

A by-product of the dairy industry obtained from the skim milk remaining when butter is made is casein. When this by-product can be sold profitably, it helps to increase the total receipts for the milk products, so that the returns to the farmers are more nearly commensurate with their costs. Large quantities of this casein are now being imported chiefly from Argentina, and we protest that it should not be placed on a free list but should have, instead, the same protection as other dairy products. (See Exhibit F.)

THE MENACE OF DANISH BUTTER WITH A COMPARISON OF MINNESOTA AND DANISH BUTTER COSTS.

At the present time foreign butter is coming into the United S5ates at the rate of nearly 2,000,000 pounds per month. (See Exhibit G.) Over one-fourth of this originates in Denmark. It is laid down at our eastern seaboard in the very heart of the consuming center of our country with a very low ocean freight rate—1 cent per pound without refrigeration, or 1¼ cents with refrigeration. Butter makers in Minnesota, the heart of the United States butter-producing section, must pay 1¾ cents f. o. b. to Philadelphia in carload lots, or 2¾ cents in less than carload lots. The comparison is distinctly in favor of the Danish farmer. (See Exhibits J and K.)

A year ago I visited Denmark for the purpose of studying Danish dairy methods. I discussed their production and marketing methods with a large number of marketing specialists and officials. They have a climate unsurpassed for dairying. They have access to the labor reservoirs of Poland and Russia for cheap contract labor to cheaply grow the roots, hay, and grain crops upon which they depend for the most of the feed for their cows. Ocean freights on cottonseed meal and linseed cake, etc., from points of exportation to Denmark do not make those concentrated protein feeds much higher in price than the average in United States. Innumerable safe harbors give the Danes unsurpassed shipping facilities for their butter.

England is a natural market for Danish butter and bacon, upon the combination of which Danish agriculture is established. England does not now consume unlimited quantities of good butter, and United States exchange situation somewhat favoring the move, the Danes are now, therefore, exporting to the United States a part of their butter. This enables them to keep the English market free and in favor of the seller. Many Danes told me frankly that they considered England their natural market, but they would have to take care of that market now and "nurse" it, as it were, and not to force too much butter upon it.

The United States, therefore, furnishes an ideal dumping ground for the Danish surplus any time that the English market needs relief. But more important than that, we must not overlook the fact that with a freight advantage, with cheap labor at their door, cheap eastern concentrates for the future, the Danish farmer can continue to undersell our Minnesota and Wisconsin butter makers in our eastern markets unless the import tax is sufficient to cover the difference in production costs.

Attached is a complete study of production costs in Minnesota and Denmark, showing that it cost 14 cents last summer more to produce and manufacture a pound of butter in Minnesota than in Denmark. (See Exhibit H.)

Denmark has not been alone as a growing exporter of butter and other dairy products to the United States. The Argentine Republic during the past 10 years has been increasing its exports by leaps and bounds, as is shown by the attached exhibit. (See Exhibit I.)

TARIFF SCHEDULE DESIRED.

For the reasons already outlined in this brief, we desire the following paragraphs to read:

"PAR. 707. Whole milk, sweet or sour, 3½ cents per gallon; cream, sweet or sour, having not more than 20 per centum of butter fat, 15 cents per gallon, for each additional 5 per centum or fraction thereof of butter fat, 5 cents per gallon additional; skim-milk, 1 cent per gallon; ice cream mixtures, unfrozen, having not more than 15 per centum of butter fat, 15 cents per gallon, for each additional 5 per centum or fraction thereof of butter fat, 5 cents per gallon additional; frozen, having not more than 15 per centum of butter fat, 9 cents per gallon, for each additional 5 per centum or fraction thereof of butter fat, 3 cents per gallon additional.

"PAR. 708. Milk, condensed or evaporated. In hermetically sealed containers, unsweetened, 1 cent per pound; sweetened, 1½ cents per pound; all other, 1¾ cents per pound; whole milk powder, 3½ cents per pound; cream powder 8 cents per pound; and skimmed milk powder 1½ cents per pound; malted milk and compounds of or substitutes for milk or cream, 20 per centum ad valorem.

"PAR. 709. Butter, 10 cents per pound; butter substitutes, 10 cents per pound.

"PAR. 710. Cheese, valued at less than 30 cents per pound, 5 cents per pound; valued at 30 cents or more per pound, 25 per centum ad valorem; cheese substitutes, 5 cents per pound; lactarene or casein, 4½ cents per pound (this article now appears on the free list); sugar of milk 4½ cents per pound; all other dairy products not otherwise provided for, 20 per centum ad valorem."

EXHIBIT A.

Record of cow-testing association, Blair County, Pa.

Number farms	[illegible]
Current expenses	$8,351.[illegible]
Grain	$13,712.[illegible]
Roughage and pasture	$11,190.[illegible]
Labor	$12,643.[illegible]
Hauling milk	$5,512.[illegible]
Interest depreciation, etc	$4,162.[illegible]
Decrease in inventory	$5,656.[illegible]
Total cost	$61,229.[illegible]
Returns, other than milk products	$6,625.[illegible]
Net cost	$54,603.[illegible]
Net cost plus 10 per cent for managing, lost time, etc	$60,064.[illegible]
Cost per 100 pounds	$3.[illegible]
Cost per quart	$[illegible]
Pounds milk per cow	[illegible]
Feed consumed per cow:	
Grains (pounds)	[illegible]
Silage (pounds)	5,[illegible]
Hay (pounds)	1,[illegible]
Stover (pounds)	1,[illegible]
Labor per cow except hauling:	
Man hours	[illegible]
Horse hours	[illegible]
Cows per farm	11[illegible]

Current expenses include insurance, taxes, repairs, medicine, bedding, breeding fees, salt, etc.; man labor charged at current prices for year and community; horse labor charged at current prices for year and community; breeding fees charged at actual cost; pasture at $2, $4 per acre per cow; feed at market price at the farm. manure credited at $15 per cow for what was produced at the barn; calves credited at current value at 3 days of age; interest charged at 5 per cent; increase or decrease in inventory gotten by taking inventories at beginning and end of year.

EXHIBIT B.

COST OF PRODUCING MILK IN THE HUNTINGDON COOPERATIVE COW TESTING ASSOCIATION, YEAR OF MARCH, 1920–APRIL, 1921.

[Pennsylvania State College School of Agriculture and Experiment Station.]

The information in this report has been calculated from figures that were kept by the tester in the Huntingdon Cooperative Cow Testing Association in addition to the regular association records. Special blanks were prepared for keeping a record of the labor, current expenses, and inventories. These records together with the regular association records on feed and milk production give the complete cost figures.

The following are the averages of 23 herds having a total of 271.2 cows, or an average of 11.8 cows per herd:

Average cost per 100 pounds	$[illegible]
Average cost per quart	$[illegible]
Average cost per pound butter fat [2]	$[illegible]
Average pounds of milk per cow	6,[illegible]
Average pounds of butter fat per cow	[illegible]

[1] Includes hauling.
[2] Credit for skim milk at 40 cents per hundredweight.

Pounds of feed required to produce 100 pounds of milk:

	Pounds.
ain	25.2
age	61.7
y	18.1
ver	13.6
een feed	2.1

Number of hours of labor required to produce 100 pounds of milk: Man, 2.2 hours; se, 0.04 hour.

Pounds of feed required to keep a cow for a year:

	Pounds.
in	1,562
age	3,830
	1,125
ver	844
en feed	133

Number of hours of labor required to care for a cow for a year (not including market-; of milk): Man, 140.4 hours; horse, 2.7 hours.

The average herd required daily 44 pounds of straw as bedding. Most herds were stured six or seven months while one herd was not pastured.

n calculating the records the following factors and values were used:

Heifers entering the herds during the year were charged at $95 each. Most of the ds are kept up by the addition of home-raised heifers. Practically no cows were rchased, while 45 heifers entered the herds during the year.

Pasture was charged at $2 per month per cow.

Man labor was charged at 30 cents per hour and horse labor at 20 cents per hour. is allows $7 per day for a man and team.

Straw was charged at $12 per ton, which was the farm value for this community last r.

No percentage rate of depreciation was figured on cows, since the inventory was en at both beginning and end of the year. This allows for any increase or decrease value. Depreciation on buildings and equipment was determined the same way. is amounted to about 10 per cent on equipment and 2 per cent on buildings.

A credit of $15 per cow was allowed for manure that was produced while the cows re in the barn. This is at the rate of about $2 per ton.

A credit of $5 per cow was allowed for all calves living at 3 days of age. There were no ws or bulls that died during the year, while there were 16 calves that died before ey were 3 days old. There were 254 calves, both living and dead, produced during e year. This leaves 17.2 cows that produced no calf during the year, either because ir breeding was neglected or they failed to breed. Every cow ought to have a lf during the year, and if she does not she should be disposed of.

Breeding fees were determined by figuring the cost of keeping the bull, except ere no bull was owned, when they were charged at actual cost to the farmer.

Five per cent interest was figured on the average value of the bull, and charges re made for insurance at 25 cents per year; 125 hours of man labor, at 30 cents per ur; 1 ton of straw for bedding, at $12; feed, at $86.71, and allowing a credit of $20 manure.

The feed was charged in the following manner: Hay, 7 pounds per day for 12 months, $21 per ton; silage, 15 pounds per day for 7 months, at $8 per ton; and grain, 5 unds per day for 12 months, at an average price of $2.38 per hundredweight.

The grain was made up of the following mixture:

	Pounds.	Amount.
ts, at $2.70 per hundredweight	300	$8.10
ta at $2.25 per hundredweight	300	6.75
rn, at $2 per hundredweight	300	6.00
meal, at $3 per hundredweight	100	3.00
Total, at $2.38 per hundredweight	1,000	23.85

Before figuring the cost per hundred pounds, 10 per cent of the net cost was added allow for the dairy's share of lost time and managerial ability, according to the uni-rm schedule adopted by the United States Department of Agriculture.

The cost of producing milk in this section was found to be divided in the following manner: Feed 45.4 per cent, labor 26.6 per cent, other expense 28 per cent.

The following is a detailed statement of the cost of keeping a cow for one year.

Feed:		
Concentrates	$36.37	
Roughage	37.08	
Pasture	10.95	
		[illegible]
Labor (does not include marketing)		[illegible]

COMPARISON OF COSTS OF BUTTER FAT PRODUCTION IN DENMARK AND UNITED STA[illegible]

This comparison of costs shows that for the year April 1, 1920, to March 31, 19[illegible] the cost of producing 1 pound of butter fat in Minnesota and Denmark was as follo[illegible]

Minnesota	$[illegible]
Denmark	[illegible]
Difference in favor of Denmark	[illegible]

The costs of production of butter fat in Denmark are compared with the co[illegible] Minnesota, for the reason that the costs of transportation of butter is the same f[illegible] both sections to the eastern markets and Minnesota is one of the important b[illegible] producing States.

Minnesota costs are based on costs as published in the University of Minne[illegible] Agricultural Experiment Station Bulletin 173 for a group of farms about Co[illegible] Minn., a butter-fat producing section. These costs as given in the bulletin have [illegible] brought up to date by applying new prices to the quantity figures given therein. [illegible] new prices for feed and labor were obtained from the Crop Reporter as publish[illegible] the United States Department of Agriculture. Other items of cost were obta[illegible] from the bulletin as published and through correspondence with the university.

Cost of butter fat production per cow year, Apr. 1, 1920–Mar. 31, 1921, Cokato, [illegible]

Feed per year.	Quantity.	Price.	C[illegible]
Oats ... pounds	328	[1] $1.87	
Corn ... do	511	1.81	
Barley ... do	82	1.85	
Bran ... do	144	2.15	
Shorts ... do	36	2.15	
Oilmeal ... do	18	3.25	
Alfalfa ... do	162	[2] 15.00	
Mixed hay ... do	3,063	13.25	
Corn fodder ... do	91	8.00	
Corn stover ... do	424	4.00	
Silage ... do	631	7.00	
Pasture ... days	177	[3] 2.00	
Labor:			
Man ... hours	132	[4] .35	
Horse ... do	34	[4] .13	
Overhead:			
Barn			
Equipment			
Bedding			
Sire service			
General			
Depreciation, at 12 per cent			
Interest on $80, at 8 per cent			
Total costs			
Credits: Calf, $5; manure, $10; skim milk, $21			
Net cost of butter fat produced per cow			

[1] Per hundredweight. [2] Ton. [3] Per month. [4] Per hour.

The average butter-fat production for the State of Minnesota is 150 pounds per cow; ıverage cost per pound of butter fat in Minnesota based on above figures, 54 cents er pound.

COSTS FOR DENMARK.

The detail costs given below were obtained from the bureau of agricultural costings, enmark, by the United States consul general at Copenhagen. The rates of exhange for conversion of Danish values to United States values is the average of the ıonthly foreign exchange rated in New York on Copenhagen as reported in the ederal Reserve Bulletins for the year April 1, 1920, to March 31, 1921.

osts of production of 1 kilogram of butter fat in Denmark in the year Apr. 1, 1920, to Mar. 31, 1921.

[From bureau agricultural costings, Denmark.]

	Kronen.	
odder:		
4/6 kilogram oil cakes, at 48 ore	2.21	
1 kilogram other concentrates, at 36 ore	.36	
1.6 food units of straw, at 25 ore	.40	
0.6 food units of hay, at 17 ore	.10	
7.0 food units of roots, at 23 ore	1.61	
5.2 food units of grass and green crops, at 17 ore	.88	
		5.56
ther expenses on the farm:		
Labor	.92	
Remuneration to owner or manager	.35	
Interest	.37	
Rent of dwelling	.28	
Articles of inventory	.08	
Horse labor	.08	
Sundry expenses	.11	
		2.19
rriage of milk to the dairy		.77
Gross expenses		8.52
edits:		
Value of manure	.59	
Value of 24 kilograms of skim milk, at 8.86 ore	2.13	
		2.72
Net cost 1 kilogram butter fat		5.80

Reduced to United States quantities and values: 1 kilogram butter fat equals 2.2 unds; 2.2 pounds of butter fat costs 5.80 kronen; average exchange rate on Copengen for the year April, 1920, to March, 1921, 1 kronen equals 15.99 cents; 2.2 pounds itter fat costs $0.927; 1 pound butter fat costs $0.418.

[1] From Argentine River Platte (a commercial publication), November 25.

BRIEF OF GRAY SILVER, REPRESENTING THE AMERICAN FARM BUREAU FEDERATION.

It is shown that a tariff is needed to protect the American dairy farmer from th[illegible] importation of quantities of dairy products, which, though small in volume, grea[illegible] depress the market price received by American dairymen.

It is shown that this tariff will not seriously increase the cost of dairy products [illegible] consumers, nor deprive them of the benefits of importation in case of a shortage [illegible] production within the United States.

IMPORTS AND EXPORTS.

Tables I to VI present the figures as to exports. Table VI balances imports [illegible] exports on a milk basis. They show that from 1910 to 1914 imports and expor[illegible] about balanced, but that exports have greatly exceeded imports since 1915 [illegible] diminishing rate since 1918, however, the excess being only 828,000,000 in the [illegible] half of this calendar year. The European cheeses have been included in Table VI as imports. It would have been better to have omitted them. They are larg[illegible] made from skim milk or other than cow's milk. Also they do not compete wi[illegible] our dairy products really.

As to butter, we have usually had an excess of exports, but since 1919 the exc[illegible] has decreased until for the fiscal year 1921 the deficit was 25,000,000 pounds. [illegible] June and July of this year, however, exports have been in the lead.

As to cheese, an excess of imports seems to be normal, but during the war th[illegible] reverse was true. For the fiscal year 1921 we were back on an excess import bas[illegible] Our exports of cheese are of the cheddar type, and our imports are over half of th[illegible] various European types not made in the United States at all, or in some cases n[illegible] made in sufficient quantities.

It was in condensed and evaporated milk that our big exports were made. "Th[illegible] Europeans have usually taken condensed rather than evaporated milk." The w[illegible] created a tremendous demand for condensed milk. Our production more th[illegible] doubled from 1914 to 1919. Exports grew to over 700,000,000 pounds in 1919. Sin[illegible] then, however, our exports have slumped badly, being only 262,000,000 in fiscal ye[illegible] 1921.

Our imports of milk and cream from Canada have always exceeded our exports [illegible] Canada. This is largely a matter of geography, the dairy sections of Canada b[illegible] nearer to our large cities in the East than any dairy sections of our own adequa[illegible] supply the needed milk and cream without being subsidized.

The Tariff Information Survey on dairy products shows that our imports of but[illegible] have mostly come from Canada and Denmark, Canada being in the lead increasing ever since 1916. Formerly considerable imports came from Australia and Ne[illegible] Zealand. Recently our imports seem to have returned to former channels, Denm[illegible] leading by a margin of 10,000,000 pounds in 1920 (calendar year). Netherlands [illegible] us over 3,000,000 pounds in 1920. Australia did not ship much here in 1920. [illegible] New Zealand sent us 645,000 pounds. Argentina has become a new entrant [illegible] the field, shipping us over 4,000,000 pounds in 1920.

Obviously the countries south of the Equator have a seasonal advantage over [illegible] our winter dairy production.

Our exports are mostly to the West Indies, Mexico, Central America, the north[illegible] States in South America, Philippines, and Canada.

The reason for our recent reversal in butter commerce is partly explained by Ta[illegible] VII. Ever since August, 1920, butter prices have been high in the United Sta[illegible] relative to prices of other farm products. Along with this must be taken the [illegible] that in Europe prices have been relatively low, butter being a luxury over th[illegible] Great Britain, by trade agreements with Canada, has also shut off the Danish imp[illegible]

Our cheese imports have come from Italy, Switzerland, France, and the Netherla[illegible] but recently considerable has come from Argentina. The imports from Argentina [illegible] partly of the Italian varieties, taking the place of what formerly came from Ita[illegible] Great Britain has always received the major portion of our exports, Cuba ra[illegible] second. Mexico, Central America, the West Indies, and Canada have received [illegible] of the remainder.

What little condensed milk has been imported came from the Netherlands [illegible] Switzerland up to 1916 and 1917, but since then has come mostly from Canada. T[illegible] Netherlands was back again in the game in 1920, but has shipped very little t[illegible] United States since last August. New Zealand shipped 111,000 pounds one mo[illegible] 1920, but has shipped none since. (I do not understand why the Netherlands should [illegible] to the United States when the United States is at the same time exporting [illegible]

ıntities to the United Kingdom and France; there must be some special reason it.[1] Our exports to the United Kingdom, Belgium, and France have been large ce 1916 and were still large in 1920. Cuba and the Philippines are the largest other ısumers of our goods. Panama and China also import our condensed milk.

PRODUCTION.

'he billion pounds of milk imported into the United States in the form of butter, ese, cream, etc., in the fiscal year of 1921, is only 1 per cent of our total production. ' excess of exports over imports was 7 per cent in 1917, but has been less than 1 cent in 1921. Our excess imports of butter in the fiscal year 1921 were only 2 cent of our total factory and farm butter production. Our total combined imports ailk and cream were about 1 per cent of the household use of milk and cream in United States. Foreign trade is therefore a minor factor in this field.

able VIII shows the growth of dairying in the United States in terms of dairy cows. get comparable figures, heifers a year old and over on January 1 were included. had over 3,000,000 more dairy cows in the United States in 1919 than in 1909. increase was from 3.2 per farm to 3.7 dairy cows per farm. The increase was slight, however, in the New England and North Atlantic States.

ut the absolute production of milk is important in this connection, but the increase elation to the demand. The question of the effect of a tariff on dairy products in long run depends upon whether our milk production will keep up with our popula- and our per capita consumption. (The tariff for particular emergencies or porary deficits like the present is a separate matter and will be discussed later.) answer to this question involves a consideration of the various systems of farming peting with dairying.

orn-and-hog farming always has had first choice of our farming land over dairy lucts, and it will continue to do so until our agriculture is very greatly intensified. ean by this that land that is well suited to growing corn for grain and feeding hogs be used for that purpose in place of for producing milk, and will, as at present, worth more per acre for that purpose than for dairying. Land not so well suited for will be used for dairying and will be worth less per acre. Milk, however, being ant a product which requires production near where it is consumed, will always produced in considerable quantity everywhere. Furthermore, a considerable pro- tion come as a sort of by-product to beef-cattle farming, or as a supplement to other enterprises.

ow, there is in this country a very large acreage of land available for dairy pro- tion that corn production will not need. It is located mostly on the northern of the Corn Belt. At present dairying is competing seriously with grain for this itory. Within the last 10 years, it has gained ground over grain farming in much is territory. The tendency will be for this to continue, for the simple reason that ying is a more intensive system of farming than grain farming, and growing popula- will gradually compel us to produce a larger product per acre. (At a still later e, cereal crops for direct human consumption tend to replace dairying.) At any one , the limit between grain farming and dairying will depend upon the relative es of grain and dairy products. The question is as to whether world prices for y products, that is, prices that will prevail under a system of free trade with other ntries, will give us an adequate home production.

urope in general is at a deficit stage in milk production. The limit in milk con- ption in a populous country, however, is likely to be reached before the limit of luction; that is, the economy of farm production may make possible the production xport of dairy products which the producers themselves can not afford to eat. is true of some of the territory exporting dairy products in Europe to-day. Thus however, other countries of Europe, more prosperous, have been able to absorb surplus. (Just now, due to the war cost, this probably is not true, but the condi- is probably temporary. We need not fear milk competition from Europe.)

he newer countries, like Argentina and Canada, are passing into dairy production. ada, being largely north of profitable growing of corn for grain, is essentially a and dairy region. We can expect a surplus production in that area. The petition of dairying in most of Canada is with grain, as in the United States. It kely that there is ample territory in the United States which can produce on even s with Canada so that we need not worry over production from that source. That not mean that there will not be imports from that source. If Canada were a

[1] xplanation seems to be that they are Nestle & Co. branded goods.

part of the United States there would be much moving of dairy products, especially milk and cream, over the present boundary. This is merely a matter of geography and location with respect to big centers of consumption in the United States. Under free trade the same thing will happen. The bulk of the movement will be toward the United States, because we have the population. So long as we are sending dairy products to Europe, putting a barrier against Canadian products will have no important effect, except for milk and cream, which must have a local market. If we develop a domestic deficit, then a tariff against Canadian butter, cheese, and condensed milk will be effective, prices will rise enough to attract more land into dairying away from small grain and corn.

Argentina has a large area, like the United States, that is better suited for dairying than for corn and where dairying competes with small grain. As in the United States dairying will expand as fast as small grain will let it.

The solution virtually is about this: The United States, Argentina, and a few other new countries have territory within them situated favorably, in an economic sense, for producing dairy products. Small grain and dairying and corn-and-hog farming, to some extent, are competing for this territory. Grain is well suited to export, as is corn. Dairying is likely in any of these regions to maintain itself at a point where it supplies the home demand, and some in addition for export. Grain will be exported in preference to dairy products. If, however, deficits develop in Europe or elsewhere, then prices will be high enough to favor exporting a little more dairy products and a little less grain. As grain prices are largely on an export basis in these countries, so also must dairy products be, even though little or no dairy products are exported. Competition with grain for land keeps them on this basis. In whatever export trade develops, the various countries named, United States, Argentina, will be on an even basis, except for differences in ocean hauls and interior hauls to exporting points. Our data on imports and exports show that the Tropics always are deficit areas, and this means that the United States, Argentina, and similar regions must have a surplus to export to them. All will compete for this trade. Prices at home will be set by this market, and the market in Europe in case there is a deficit there, less transportation costs in each case. The same is true for grain prices and grain prices at home keep in line with butter prices.

The purpose of this analysis is to show that price levels are likely to be adequate in the United States to call forth a domestic production sufficient to meet home consumption, and something of a surplus besides.

When the countries producing a surplus are examined more closely, however, some differences may develop, relating principally to methods of production in these countries and supplies of the factors of production. Dairying requires a larger ratio of labor and capital to land than does grain farming. (Labor for milking, feeding, etc., and capital for buildings, investment in herd, etc.) The particular region which is best supplied with both of these will be favored in dairy production. The level of wages in Argentina relative to the United States does not tell us anything. What we need to know is whether wages are higher or lower relative to land values and interest rates in Argentina than they are in the United States. In general interest rates are relatively high in Argentina and land and wages low. Let us suppose the following:

	Wages.	Interest rates.
		Per cent.
United States	$50	6
Argentina	25	8

Under these conditions, a farm enterprise would be favored in Argentina which, first, used a considerable amount of labor; second, a great deal of land per unit of product; and third, very little capital. (No accurate data covering these points have been discovered in the time at my disposal, but it would seem that Argentina in general does not lend itself strongly to dairying. In the special dairy regions conditions may be quite different, of course. Land values will be higher than the average, but probably not equal to the value of the good corn lands. Wages will be a little lower, and probably interest rates. If there is a large supply of family labor, that will mean more than lower wages.)

As for Canada, there are large areas where all conditions favor dairying, and area is great in proportion to population.

EMERGENCY TARIFF PROTECTION.

Table VII giving prices of dairy products, cereals, etc., from 1909 to 1921, the iverage of years 1909–1914 being taken as 100, shows that from 1916 (starting in July) intil August, 1920, prices of butter were below the prices of other farm products. For period of a year from May, 1917 to May, 1918, butter prices were fully 20 per cent elow the average. Since September, 1920, the opposite has been true, butter prices veraging nearly 30 per cent above other farm prices. During the war, the strong lemand was for cereals and textiles. Hence these prices rose fastest. The effect of his was that less than the proper number of hiefers were raised. We are now feeling he results two years later in a threatened deficit of dairy products. During the years rom 1917 to 1920, we were getting the milk from the expansion in dairying that came 1913 to 1916.

TABLE IX.—*Milk cows in United States, 1910 to 1921* (*Bureau of Crop Estimates*).

910	20,625,432	1916	22,108,000
911	20,823,000	1917	22,894,000
912	20,699,000	1918	23,310,000
913	20,497,000	1919	23,475,000
914	20,737,000	1920	23,619,000
915	21,262,000	1921	23,321,000

(Table IX contains the evidence for this statement.) Our prices were low in this eriod, and we had a large exportable surplus. We are now facing the possibility of deficit for a period. It may not actually develop, but the fact that prices have arted upward vigorously again of late indicates that it is likely to happen.

Part of the impending deficit is due to maladjustments that came during the war. here was a tremendous shift to condensed milk and cheese, and we are not back to a ormal basis yet.

If the deficit develops, then the tariff will maintain prices at a higher level until ch time as production catches up again. The tariff in the meantime acts as a subdy to the dairy industry, stimulating the industry to make up the deficit as quickly possible. Consumers are interested in this process as much as the producers—in ct, more so. There is always one danger connected with it, namely, that the subsidy ill overstimulate production, with a consequent period of a large exportable surplus. very moderate stimulant is all that can safely be advised.

LOCAL TARIFF ISSUES.

There is always a deficit of milk and cream in the New England States. Even ough much milk and cream comes from Canada, prices are always considerably gher there than in New York and Philadelphia. The effect of a tariff will be to ise prices on milk and cream to a still higher level in Boston. If the tariff is very gh prices will rise part way and consumption will fall off. (Condensed milk and ilk powder will be substituted increasingly for fresh milk if fresh milk prices rise uch higher in New England relative to the dairy sections in the United States.) he additional supply of milk will come in part from farms in New England, more rgely from farms to the west, and from creameries in New England. This will croach on New York and Philadelphia territory and raise prices a little there.

If the tariff is moderate, some milk will still come from Canada, prices will rise the ll amount of the tariff, consumption fall off less, and the rest of the supply will come om New England and West. The lower the tariff, the more will be imported.

It is a mistake to assume that producers will benefit by the full amount of the rise price. Only those who are now producing at present prices will benefit the full ount of the rise. The new production will take the place of other products (now oduced). Only the extra profit of the new enterprise over the old will be a benefit. me of the new producers will just break even and make no more profit than from eir former enterprises. On all the milk that is transported from longer distances, tra hauling costs will be taken out.

THE RATE—BUTTER.

It will be apparent from the foregoing analysis that no large permanent protection needed, even if it is highly important that we produce all our own dairy products ich seems to me open to some question. We do not produce all our own wool, flax, gar, etc., why should it be a serious matter if we do not produce quite all our own

butter? We probably can, however, even without a tariff; the question is purely an academic one. What is really needed is some way of stabilizing the industry. The tariff method of doing this on the whole is a poor method. Nevertheless it seems to be the easiest and most popular one. I would recommend that the remedy be applied cautiously, that a tariff be applied with the idea of giving the industry a stimulus to catch up, and not to over-catch-up.

It is difficult to predict what tariff will shut out all importations of butter until home production catches up; any tariff can be passed entirely on to the consumer up to the point where the added price cuts consumption down. In other words, a tariff can be used to extort a full monopoly price from the consumer until production catches up. The importer will sell for the same price (net) in this market regardless of the tariff, until home production catches up. The only difference will be that American consumers will not take as much if the tariff passed on to him is a stiff one.

The right way to figure is not the foregoing, but instead, what addition to price will give a good, healthy stimulus to the industry. I am of the opinion that 6 cents per pound is about all that is wise. I don't believe it well to shut out all foreign butter. But I think it will give our industry a chance to get back on its feet in plenty of time.

WHOLE MILK.

On the basis of physical equivalents, 6 cents per pound on butter equals about [illegible] cents per gallon on milk. Butter has to be manufactured, on the one hand, but the skim milk is left with the producer. These may be assumed to offset each other. Milk, however, is more expensive to transport than butter. But since the [illegible] purpose of using this method of equivalents is to keep milk from being shipped over the line to be made into butter, the transportation difference is not very important, unless one goes back a ways from the line. (It costs over 5 cents more to ship a gallon of cream from Sherbrooke to Boston than it would its butter content.) Transportation, however, may be considered as protection in this case.

The system of computing rates on physical equivalents is not valid. Only when the tariff is actually raising the price of our butter over Canadian butter is there an incentive to carting whole milk over the line to be made into butter. As we have seen, only temporarily or occasionally will there be this price difference. Since it is so transitory, no regular business will be built up on the basis of it. The so-called "line creameries" started in 1909 on the basis of the Payne-Aldrich differential [illegible] learned this to their sorrow. Besides, it would be cream that would be gathered in Canada and not milk anyway.

The real purpose of the tariff is to keep Canadian milk out of Boston and other New England markets. Very little milk is so imported anyway, but since the New England milk producers are interested in academic as well as practical questions we must address ourselves to it. Whole-milk prices in Boston are considerably above butter-content values. The system of arriving at prices to producers clearly recognizes this. Nor is the excess of milk prices over butter-content values a [illegible] thing. It varies from season to season, from contract to contract, from city to city. The tariff protection needed must therefore vary with these differentials. The higher the differential, the more likely milk is to be brought in from Canada, because more milk will be worth more as whole milk in Boston than as butter in Canada. Transportation rates of course affect this problem. They have doubled since [illegible]. This lowers the value of Canadian butter on the Canadian side (farther from its market), but raises prices of whole milk in Boston. Since milk is 24 times as heavy as butter made from its butter fat, the rise in rates has given added protection to the New England whole-milk market. Another factor in the problem that must be considered is competition with cream. Most of the cream comes from a distance entailing [illegible] cents per gallon of transportation expense. As cream, this same butter fat can be shipped for a tenth of this amount. The cream rate should be about 11 times the butter rate, less about 5 cents per gallon. The new milk supply shipped will largely come from stations in the United States now shipping cream. The whole-milk rate can safely be a little high relative to cream, because it is more bother to produce market milk than market cream.

The Payne-Aldrich rate was 2 cents per gallon. Just a little milk dribbled in under this tariff. A 2-cent rate for milk and about 10 or 12 cents on cream would be reasonable equivalents (2 and 17 cents or equivalent technically). The emergency bill levies 2 cents per gallon. Some milk seems to have been imported. This, however, may be temporary. The Fordney bill proposes 1 cent per gallon. It may be entirely adequate in the end. One cent on milk and 5 cents on cream would be near enough to equivalent.

CREAM.

Physical equivalence, assuming 40 per cent cream, would make 24.4 cents per allon as equal to 6 cents per pound of butter. A gallon of 40 per cent cream weighs .28 pounds. It contains 3.39 pounds of butter fat, which at 20 per cent overrun nakes 4.07 pounds of butter. ($4.07 \times 6 = 24.4$ cents.)

There is more purpose to the method of physical equivalents in the case of cream han of whole milk, because a large part of the cream comes out of butter territory in 'anada; also the buyers have to buy on a butter basis. However, only in case butter rices are higher in the United States than in Canada, as during the present temporary hortage, will there be a tendency for cream to be shipped over the line to be made nto butter. During a period of this kind, cream wagons might haul from Canadian erritory to advantage, but the volume of business represented would be small.

So far as Canada is concerned, shutting Canadian butter out of our eastern markets ill undoubtedly lower the prices in some areas on the Canadian side by a small mount, relative to prices in the United States, even though both countries are on an xport basis. New York is the most economical market for these producers. They re nearer to it than is Minnesota. Hence they enjoy the advantage of location with espect to it, which reflects itself in higher prices. When they are shut out of this arket, then butter must go into export over a more expensive haul. English prices ss cost of hauling will set the level of prices. New York prices in a period of export e set largely by export to the West Indies, Central America, and South America, though most of the time enough is exported to Europe to keep the two export prices line. The New York price thus established is about the same as the Canadian xport price. Now, to the extent that any Canadians can reach New York cheaper an they can Canadian export prices, they will be injured by a tariff shutting their utter out of the United States. Of course, it can not be very much.

Lower prices for butter in Canada will probably mean a little less production and ore grain and other competing crops.

Part of this same analysis applies to the advantage of location of the dairy regions the United States with respect to consuming sections in our own Southern States d to Central and South America. The Canadians have profited from this indirectly, that the moving of our butter south has left the New York market a little more open them.

The foregoing is merely an example of a local effect of a tariff which may result en though both countries are on an export basis.

To shut out Canadian butter permanently, therefore, a little tariff is needed to ercome this local advantage. I would say that 2 cents is more than adequate in dinary times, and 4 cents in emergencies.

It will later be developed that about 6 cents is all that is wise for a general emergency riff. If desired, the 2 cents for local protection can be added to the 6 cents for ergency protection, although it is my judgment that that is unnecessary, the 6 nts will be in force all of the time even though needed only in emergencies.

A further statement needs to be made as to tariff and grades of butter. Although e general level of butter prices may be no higher in New York than in Europe, it ay happen at any time that either the lower or the higher grades are selling at a emium there over other markets. This may encourage imports of those grades for while.

Also, as to local effect, local creameries make all kinds of butter. For a time, a nadian creamery just over the line may find it profitable to pay 2 cents tariff and sell the United States, because of a market for his very poor or very good butter.

But the total effect of the Canadian butter that comes to the United States is practically nothing so far as price is concerned. The effect is not as much as one-tenth of cent, for the simple reason that the amount is relatively infinitesimal. It is a case taking a cent or two of local advantage away from a few Canadian dairymen for the ke of an imagined advantage to us.

But of course tariffs are not made on the basis of the effects they produce, but rather lely for the sake of keeping out foreign goods.

Hence the tariff must be based mainly on keeping cream out at other times. The estion is one of balancing the value of Canadian cream for butter purposes in Canada ainst what it will cost to get an adequate supply of cream from this side of the line, d this is not a question of physical equivalents, but of higher costs balanced against wer consumption. The nearest calculation that can be made is on the basis of the tra cost of hauling the additional United States cream from Western New York and milar areas over the average cost of hauling the present supply obtained in the nited States. Some of the additional cream will be produced on New England rms at increased costs, but these costs will be balanced against added transportation

costs, the two being about equivalent. Hence one will serve as a measure of the other. The distance will have to be counted from New England to the new source of supply. Surely 10 or 12 cents per gallon is amply adequate for this. The emergency rate of 5 cents has not for the time being stopped importations. But butter is at a premium over Canada in the United States at present. Also it takes time to seek out new sources of cream supply. A year or two may be needed for the main buyers to make the shift, but it will surely come. I am not sure that 5 cents might not prove adequate after a year or two.

There is little or no danger involved of milk being shipped into the United States to be made into cheese. It is merely a question of foreigners making their export product up as cheese instead of butter if there is a deficit of dairy products in the United States and if import rates favor cheese. It usually takes about 10 pounds of milk to make a pound of cheddar cheese. A butter rate of 6 cents per pound of butter (25.2 cents per 100 pounds of milk) equals 2½ cents per pound on cheese. Transportation costs are higher. The Fordney bill proposes 5 cents per pound. The 1909 rate was 6 cents per pound. The 1913 tariff of 20 per cent was a reduction until cheese imports rose in value to 30 cents per pound and over in 1917–1920.

I am in favor of a reasonably high tariff on cheese. It will not permanently raise the price of cheddar cheese, since cheese prices can not permanently rise above butter price, equivalents—the two are in close competition over wide areas, and normally butter will not be affected at all by a tariff. Five cents means no more protection than 2½ cents. Most of our imports will be of foreign varieties, which are either more or less luxuries, or are consumed by our foreign population. They make a good source for revenue. The incidental protection afforded our Swiss-cheese industry will be worth while. The 5-cent rate is therefore satisfactory.

CONDENSED AND EVAPORATED MILK.

Under normal conditions from now on, there will need to be little protection for condensed and evaporated milk. Our exports are sure to be greatly in excess of imports. Just at present, however, the world is oversupplied with the product, and there is a good deal of dumping going on, from which we are suffering a little. The condensed industry is highly organized in Europe, the Nestle Co. being very aggressive after foreign markets. Only when prices of dairy products are relatively high in the United States, however, is there likely to be any condensed milk imported. The tariff is therefore largely for temporary conditions.

On the basis of physical equivalents, the duty on evaporated milk should be twice that on whole milk (6 cents per pound—one-fourth cent per pound on whole milk, or one-half cent per pound on sweetened condensed milk, two and one-half times that of whole milk, or five-eighths cents per pound. To this rate should be added a little protection on the conversion costs of manufacturers. The Fordney rates are 1 and 1½ cents per pound. They are satisfactory.

The Fordney rates on milk powders are based on equivalents and in proportion to those on condensed and evaporated milk.

A further statement is necessary here. It has been pointed out with respect to butter that effects of location will cause a tariff to lower the price of butter in territory close to the United States boundary by 1 cent per pound, perhaps 2 cents, at times. This will require a duty of 4 cents per gallon, or perhaps 8 cents, minus a small extra transportation charge for cream over butter.

It is also true that when butter prices are relatively high in the United States because of temporary shortages here, that cream can be profitably shipped from Canada to the United States in place of butter unless the duty on cream is equal to its butterfat equivalent. For this reason cream seems to be coming into the United States now in spite of an emergency tariff of 5 cents per gallon. If it were feasible to ask for a tariff at this time on cream at a rate of 24.4 cents per gallon, it would check this importation. But it does not seem feasible to ask for 25 cents when the most that has ever been levied is 6 cents per gallon. If the entrance of Canadian cream meant a serious loss to the dairymen of the United States there would be some purpose in it. If Canadian cream starts to lower the price of cream in Philadelphia, then more cream will be made into butter, and will receive the benefit of the high butter prices prevailing. Cream prices are always closely in line with butter prices. The dairymen's organizations are mostly able to shift from cream to butter and back very quickly. Here the damage to the dairymen is not very great after all—it is for the most part an apparent, not a real, damage. On the other hand, 25 cents a gallon on cream will cause a lot of opposition from all sources and will seriously prejudice the whole dairy program. The dairy interests of the rest of the United States can not afford to take this chance for the sake of the dairymen of the North Atlantic States.

BUTTER.

[Paragraph 709.]

STATEMENT OF O. M. CAMBURN, DIRECTOR OF THE DIVISION OF DAIRYING AND ANIMAL HUSBANDRY, MASSACHUSETTS DEPARTMENT OF AGRICULTURE.

Senator WATSON. Give your name, please.

Mr. CAMBURN. Mr. Chairman, I am O. M. Camburn, director of the division of dairying and animal husbandry of the Massachusetts Department of Agriculture, appearing as secretary of the New England Dairy Tariff Committee with relation to the Fordney tariff bill, H. R. 7456, paragraph 709, on butter.

This committee is opposed to the rate given on butter of 8 cents, in the first place, because the relative costs of production between the United States and competitive foreign countries show that a higher duty is necessary to protect the United States producers.

In the second place, the increased price level on butter requires higher rate to give the same ad valorem protection as obtained der former tariffs.

Comparing Canadian costs of production and New England costs production——

enator WATSON. You are speaking now of butter wholly?

Mr. CAMBURN. Costs of production as applied to milk, stated in ms of butter. We find a difference of 10 cents per pound in favor Quebec. That is, it costs 55 cents per pound to produce butter New England, and it costs 45 cents per pound to produce butter the Province of Quebec.

enator WATSON. Wherein lies the difference?

Ir. CAMBURN. The difference lies primarily in labor costs. We re used what is known as the Warren formula. The Warren mula is a formula developed by Dr. G. E. Warren, of Cornell iversity, which was used by the New York Federal Milk Comsion when they were serving during the war period.

Vhen we take the Canada figures together with the Warren formula l apply the prices as relating to the Province of Quebec and the es for New England generally, we find that the difference in the t of production is $2.93 per hundred pounds of milk in the New gland States and $2.45 per hundred pounds of milk in the Province Quebec. That 100 pounds of milk is 3.7 per cent milk, which ild be, stated in terms of butter, 4.4. That is, 4.4 pounds of ter would equal 55 cents per pound, and the Quebec costs of $2.45 ild be the equivalent of 45 cents a pound on butter.

ome would probably say, and justly, that we should consider asportation rates on that and deduct those. So we find that in zone 281 to 300 miles, which would be the Province of Quebec, transportation cost on account of the butter is 0.0067 cent, for the New England States, in the 201 to 220 mile zone, it is 64, or a difference of 0.03 of 1 cent per pound. So when you tract 45 cents, the cost of producing butter in Quebec, from the ents, the cost of producing it in New England, we have 10 cents pound reduced by 0.03 cent; that would be 9.97, which is pracly 10 cents a pound.

herefore we feel that, due to these comparative costs, the butter rests of New England are entitled to protection to the amount 0 cents per pound on butter.

enator McLEAN. About how would that affect the retail price of ter?

Ir. CAMBURN. I am not inclined to feel that it would affect the il price of butter.

enator WATSON. You produce the butter itself, do you?

Ir. CAMBURN. I was speaking in terms of butter, as that is the is on which we are conducting our argument from a butter standnt. Later another party will present the equalization which we is desirable for milk and cream. We are taking butter as the is on which to establish and make an equalization.

enator WATSON. You are speaking of butter?

Ir. CAMBURN. Yes, sir. The relative costs between the United tes and Denmark will be pointed out by another party, but the erican consul in charge at Copenhagen, Denmark, in a statement

concerning the various items which enter into the cost of producing butter—feed, labor, and overhead costs—when compared with New England costs, showed that it cost 35 per cent more to produce butter in New England than it does in Denmark. I am speaking of that because a considerable amount of Danish butter has been coming into this country.

Another reason why we feel justified in asking for 10 cents on butter is on account of the increased price level. In 1897, when the market price of butter was about 20 cents per pound, a 6-cent duty was put upon it. At the present time, the prices ranging between 40 and 50 cents, we feel that a 10-cent duty is not excessive in order to maintain the relative ad valorem duty.

Senator McLEAN. How does the cost of producing butter now compare with the cost of producing it in 1913, the year before the war?

Mr. CAMBURN. I have no data concerning that matter at the present time, Senator. You mean the comparative costs in Canada, Denmark, etc.?

Senator McLEAN. Yes.

Mr. CAMBURN. No; I have nothing on that.

Senator McLEAN. How does the price of butter now compare with the price of butter before the war, in 1913 and 1914?

Mr. CAMBURN. That would be shown in this Exhibit C, which will be given in the form of an exhibit to be presented as a part of this brief presented by the committee.

Senator WATSON. What is the distance from Boston to the center of the Canadian area from which this product comes? I should like to get the difference in the freight paid by the people in Boston and the Canadian people.

Mr. CAMBURN. The zone would be the 281 to 300 miles zone, between 281 and 300 miles for the Province of Quebec, while the center of the source for the New England States would be around the 200-mile zone. That is, for the year 1920. As Mr. Leach has stated, the source has been moving northward. In 1910 it was nearer to the city of Boston. In 1900, of course, it was still more close.

Senator McLEAN. I should judge from this chart that the price of butter went down to about 33 cents a pound early this season and that since then it has risen to something like 47 or 48 cents a pound. Is that correct?

Mr. CAMBURN. Yes, sir.

Senator WALSH. This year?

Senator McLEAN. Yes. So that the price is higher now than it was several months ago. Perhaps that is due to the seasonal cost of producing it?

Mr. CAMBURN. I was speaking of a range from 40 to 50 cents a pound in reference to the desirability of having a 10-cent rate on butter in order to maintain the relationship between the price of butter and the duty, in order to have an ad valorem protection similar to that given in 1897.

Senator JONES. The wholesale price of butter in Boston for the last week in October was 47 cents.

Senator WALSH. What is the section of Massachusetts that produces butter?

Mr. CAMBURN. I am speaking for New England as a whole.

Senator WALSH. Is there very much produced in Massachusetts?

Mr. CAMBURN. Not a great deal.

Senator WALSH. It is very much scattered?

Mr. CAMBURN. It would be something like three million pounds per ar for Massachusetts as a whole.

Senator WALSH. In the western part of the State?

Mr. CAMBURN. In a general way, in the western half of the State.

Senator WALSH. Is there much produced in New Hampshire?

Mr. CAMBURN. Not as much, Senator, as there was 20 years ago.

Senator WALSH. What about Maine?

Mr. CAMBURN. Especially is that true of New Hampshire and rmont, since those territories were originally cheese-factory terri-ies. Then, in time, they swung over to creameries. Those ameries became shippers of cream. Then, in time, after shipping am, they swung to the shipping of fluid milk. So that in New mpshire, where they formerly were making certain quantities of tter, we find little dairy farming but large quantities of milk being iduced. You might say it is moving northward. In our exhibits hown the range in 1910.

Senator WALSH. Is the range of butter moving northward, too?

Mr. CAMBURN. Yes, sir.

Senator WALSH. Is there much butter produced in Maine?

Mr. CAMBURN. That is shown in our Exhibit G, page 4, for 1920 d 1919 per month by States.

Senator WALSH. How much is produced altogether in New England, d what proportion is it to the consumption?

Mr. CAMBURN. Fifteen and three-quarters millions in 1919 and enteen and two-thirds millions in 1920.

Senator WALSH. What is the consumption?

Mr. CAMBURN. We have no direct showing on consumption. I uld not want to hazard a guess on it, Senator. Our production relatively small as compared with consumption.

Senator WALSH. Less than 10 per cent?

Mr. CAMBURN. Around that figure, I think.

Senator JONES. I have the statistics here for a few years.

Senator WALSH. I would like to have them at this point, Senator.

Senator JONES. In 1919 the domestic production of butter was 56,785,222 pounds.

Senator SUTHERLAND. For the entire country?

Senator JONES. Yes, sir.

Senator SUTHERLAND. That is production?

Senator JONES. Domestic production. The imports for con-mption were 3,020,399 pounds. The exports were 33,739,960 unds.

For 1920 the domestic production was 1,600,000,000 pounds; ports, 19,857,507 pounds. Exports were 27,155,834 pounds.

For 1921, to October 1—I have not the domestic production—the ports amounted to 12,172,730 pounds.

Senator WALSH. That is a substantial reduction.

Senator JONES. That is a substantial reduction; and the exports r the same period were 6,636,749 pounds.

Senator WALSH. That is a reduction also?

Senator JONES. That is also a reduction. The import value of the butter was 42½ cents per pound. The export value was 40 cents per pound for 1921 to October 1.

I have here also in this table figures showing the substitutes, oleomargarine, the quantity produced and exported and the value of the export and its value per pound.

(The statement referred to is as follows:)

Butter production, showing imports and exports.

Year.	Domestic production.	Imports for consumption.	Domestic exports.
	Pounds.	*Pounds.*	*Pounds.*
1919	1,556,785,222	3,020,399	[illegible]

Wholesale price of butter for week ending October 29, 1921.

CREAMERY, 92 SCORE.

[Cents per pound.]

	New York.	Chicago.	Philadelphia.	Boston.	San Francisco.	Danish.	Canadian.
Monday	47½	44½	47	46½	46½	46	
Tuesday	47½	45	48	46½	46½		
Wednesday	48	45	48½	47	46½		
Thursday	48½	46	49	47	46½	to	..
Friday	48½	46	49	47	46½		
Saturday	48½	46	49	47	46½	48½	

Senator WALSH. Does anybody know how much of the butter comes from Canada and how much from Denmark and other countries?

Senator JONES. Unquestionably the statistics of the Treasury Department will show it.

Senator SUTHERLAND. We ought to have in the record the principal countries from which we import our butter and the quantities.

Senator WALSH. Does the market in Boston get butter cheaper from Canada than from northern New York and from Wisconsin and other dairy States in the Middle West?

Senator WATSON. This gives it for 1917.

Senator JONES. It gives it up until 1919. In 1919 there were nported from Canada 4,095,403 pounds, valued at $1,843,511; from enmark, 21,136 pounds, valued at $18,087; from the United Kingom, 1,323 pounds, valued at $1,261.

Senator SUTHERLAND. That is about $1 a pound.

Senator JONES. Yes. From Australia, 3,265 pounds, valued at ,756.

Senator SUTHERLAND. There must be something wrong in connecon with the valuation of the butter from the United Kingdom.

Senator JONES. From all other countries there were imported 9,342 unds, at a value of $4,517, giving a grand total of importations of 131,469 pounds, valued at $1,869,132.

In 1920 the total importations were 20,770,959 pounds, valued at 0,916,770.

Senator WALSH. About 50 cents a pound.

Senator JONES. Yes; a little over that. So out of a total domestic oduction of 1,600,000,000 pounds the importations amount to only ,000,000 pounds.

Mr. CAMBURN. My recollection is, although I would not like to go that recollection, that the Danish production represents about per cent of the importation; but the foreign and domestic comerce reports would show.

Senator WALSH. Is that of a high quality?

Mr. CAMBURN. The very highest quality. The keenest competion that we have comes from Denmark. But that, I understand, ill be taken care of by another party, coming either to-morrow or xt week, a party who is quite well acquainted with the Danish arket and is handling the Danish butter importation question.

Senator WALSH. Are you familiar with the Boston butter market?

Mr. CAMBURN. Some.

Senator WALSH. Where does the butter sold in the Boston market me from—chiefly from Canada or the Middle West?

Mr. CAMBURN. I have nothing here in regard to the quantities that e coming into the Boston market. I have no statistics on that.

Senator WALSH. I was wondering whether they got Canadian itter cheaper than Middle Western butter or New York butter.

Mr. CAMBURN. Some 9,000,000 pounds came from Canada, but hat comes from the other States I do not know.

Senator WALSH. Into Boston?

Mr. CAMBURN. No; I mean into the country.

Senator JONES. I think it might be advisable to put into the cord at this point our butter importations, beginning in 1910. In e year 1910 there were 1,360,245 pounds; in 1911, 1,782,600 unds; 1912, 1,925,668 pounds; 1913, 1,162,253 pounds; 1914, 842,022 pounds.

That was the first year of the European War.

Nineteen hundred and fifteen, 3,828,227 pounds; 1916, 712,998 unds; 1917, 523,573 pounds; 1918, 1,805,925.

Mr. CAMBURN. In part 29 of the hearings which were held before is committee one of the cream dealers was pointing out the fact at he was unable to secure some 50 jugs of 40 per cent cream. fty jugs of 40 per cent cream weighing 82 pounds to the jug does ot sound like very much. However, he was rather disappointed, appears from his testimony, in not being able to locate that in

three or four days' time, writing out to several of the creameries over New England and not being able to locate it.

When you introduce 50 cans of 82 pounds each, it would be 4,100 pounds of cream. Forty per cent would be 1,640 pounds of butter fat. To secure that amount of butter fat would require some 41,000 pounds of 4 per cent milk. To produce that 41,000 pounds would require some 2,050 cows, if they were to produce on an average of 20 pounds a day. Of course, that is not a high production. So that the 1,640 pounds of butter fat, when made into butter, would represent almost a ton of butter—1,968 pounds of butter.

It is not surprising that a milk dealer can not go into the country and expect to find in two days' time the production of 2,000 cows or enough butter fat to be the equivalent of 1 ton of butter. A creamery which would have that amount of cream available would be in rather a serious condition. However, if they had anticipated the need for that cream it could have been secured as was shown by the replies of various creameries. The Robinson creamery, at Exeter, N. H., stated on May 28 that nearly all might be taken as sweet cream, that they could use it as sweet cream. They were receiving 6,000 pounds of cream monthly.

The Clover Ridge creamery of Millville, N. H., stated on May 3 that if there were a demand for it "We would put in a pasteurizer and sell sweet cream entirely. At present our cream is all made into butter," desiring to sell sweet cream if there were a market there.

The United Farmers' Cooperative Association at Morrisville, Vt., stated that they were shipping 60 per cent of their cream as sweet cream in 1920, and in 1921 it would be about the same.

Senator WALSH. This is in answer to the claim made by some persons who appeared from the wholesale market in Boston to the effect that they could get sufficient cream from the near-by market during a part of the year, but that there were parts of the year, particularly in the summer season, when they were forced and obliged to go to Canada because the supply was not sufficient.

Mr. CAMBURN. They were surprised at the fact that they could not write out to these creameries and secure from them an answer favorable to the shipping of 50 jugs of cream the next day. Had they anticipated that they wanted that cream in July or August and had arranged with those creameries previously, that supply is there, but the patrons need to be notified or at least be acquainted along in the previous winter with the fact that the cream can be sold as sweet cream, so that they can put up ice in order to take care of it and handle it satisfactorily so that it can be sold as sweet cream.

Senator WALSH. You contend that there is sufficient sweet cream produced to take care of the demand of the Boston market if proper notice is given to the producers so that they can store the proper amount?

Mr. CAMBURN. There is a sufficient supply of cream produced that could be taken care of as sweet cream, provided they knew in advance and put up a supply of ice; yes.

Senator WATSON. I notice that you are set down here as the director of the division of dairying of the Massachusetts Department of Agriculture. Is that correct?

Mr. CAMBURN. Yes.

Senator WATSON. In the last 10 years has dairying increased or ecreased in Massachusetts?

Mr. CAMBURN. It has decreased. The cow population in Massaıusetts back a good many years ago was about 200,000. Last year was about 153,000.

Senator WATSON. Do you think it has decreased because of Caıdian competition?

Mr. CAMBURN. That might be true, more especially recently. As e look at the conditions in 1900 and the sources from which milk ıme, we find that Massachusetts was supplying a goodly share of ıat consumed in the city of Boston and that as time goes on the urce continues northward, so that Massachusetts does feel the ımpetition of Canada in the milk coming to the Boston market.

Senator WATSON. Is any other reason operating to produce that me result?

Mr. CAMBURN. I do not recall any at the present time.

Senator WALSH. Do you not think that the abandonment of untry life for the industrial city life is largely or in part responsible r the depreciation in the number of cows and dairy farms?

Mr. CAMBURN. That might possibly be true in some localities. ıme of the men this morning were pointing out the great draw hich the city had for the farm boy.

Senator WALSH. Do you not think also that the health laws and e rigid quarantine laws and laws requiring strict inspection have d a tendency to cause a lessening of farm products?

Mr. CAMBURN. It is desirable to have good inspection in order to ke care of the consumer.

Senator WALSH. I am not complaining about it; I am speaking of e results.

Mr. CAMBURN. When the milk supply comes from a foreign coun-y—I trust it will never come to that, but there might possibly arise time when we would not be able to carry on that inspection.

Senator WALSH. I am not complaining about it. I rather approve it. But when I was governor of the State I recall that very freıently the farmers complained that the inspection was too rigid d that the visits of the inspectors were annoying and they were ing out of the business because of the rigid laws for inspection d the attempt to improve the output.

Mr. CAMBURN. Of course there has been an evolution in the spection the same as in many other things, so that those farms pplying milk to the city of Boston are now inspected by the dairy vision of the city of Boston, and the farmer whom you have just oken of is not bothered by the other inspectors unless his milk coming from a near-by source. So that the evolution there has en to a point where he has one or two inspections according to here his milk goes. If it all goes to Boston, he has one inspection.

Senator WALSH. Inspection laws were a very important factor one or two of the elections 5 or 10 years ago.

Mr. CAMBURN. That was before my time, Senator.

Senator WALSH. At that time there were a great many statistics ven claiming that the inspection laws were discouraging farmers ith one or two or three cows and driving them out of the business.

Senator JONES. Will you tell us about the inspection of the Canadian milk? Are the herds inspected up in Canada? Have you any information about that?

Mr. CAMBURN. We have only some limited information on that.

Senator WALSH. I think, Senator Jones, there are some provisions which require inspection of the sources of supply and that they can or do go into Canada and inspect the conditions under which milk is produced.

Is not that true?

Mr. CAMBURN. Yes, sir. In Exhibit A you will find a comparison of barn scores in Hereford, Quebec, as compared with milk in Vermont, showing that 21 per cent of the farms at Milton, Vt., fall below the score of 50 per cent, while at Hereford, Province of Quebec, [illegible] per cent of the farms fell below that score. At Shelburne, Vt., [illegible] per cent fell below, while at Sutton, Province of Quebec, 63 per cent fell below, showing that their dairy equipment is not up to the standard prevailing in New England territory.

Senator JONES. All of that milk is inspected in Boston, is it not?

Mr. CAMBURN. Oh, yes; on its receipt there.

STATEMENT OF J. R. MORLEY, OWATONNA, MINN.

Senator McLEAN. State your name and residence to the stenographer.

Mr. MORLEY. My name is John R. Morley. My residence [illegible] Owatonna, Minn.

Senator WALSH. Whom do you represent?

Mr. MORLEY. I am on the executive board of the National Dairy Union. I am supposed to represent on that board the cooperative creamery industry. I am also president and manager of the Minnesota Dairy Association. I am also a dairy farmer.

Senator WALSH. Where is the center for these cooperative creameries?

Mr. MORLEY. Largely in Minnesota. Our selling proposition is [illegible] the city of New York. We have a house in New York, and we [illegible] also members of the Mercantile Exchange there.

We find that the importation of Danish or foreign butter [illegible] detriment to the western farmer, as well as a demoralizer of [illegible] trade.

I have some figures for the year 1921 and the summary for [illegible] year 1920. I can give the figures for the year 1921 up to the [illegible] day of November, by months.

In January we received from Denmark 23,779 casks. They contain 112 pounds each. We received 2,670 boxes. From Holland [illegible] received 254 casks and 275 tubs. From Argentina we received 1,895 boxes. The total weight is 2,952,792 pounds. That was [illegible] the month of January, which was the time of the 2.5-cent tariff.

In February you will note there is quite a reduction. They received 13,849 casks of butter; 100 boxes and 50 tubs; 2 casks of Holland butter and 218 tubs; while from Argentina they received 2,988 boxes, making a total weight of 1,739,248 pounds. Then we had [illegible] boxes from New Zealand, which came by way of San Francisco [illegible] rail into New York during February. Those are only the receipts for the port of New York.

In March there were 34,400 casks of Danish butter and 1,288 boxes. here were 3,500 boxes from Argentina, making a total weight of 120,928 pounds.

In April we had 7,140 casks of Danish butter and none from the her points. The total weight was 799,680 pounds.

In May the emergency tariff was passed and there were 300 casks Danish butter, a total weight of 33,600 pounds.

In June there was none.

In July there were 700 casks, making a total weight of 78,400 unds.

Senator WALSH. When did the change in rate come?

Mr. MORLEY. In May, I think.

Senator WALSH. Two and one half to five?

Mr. MORLEY. Two and one half to six.

Senator WALSH. What was that?

Mr. MORLEY. Six cents.

Senator WALSH. That came in May?

Mr. MORLEY. That came in May.

Senator WALSH. In June there were no importations?

Mr. MORLEY. No importations in June.

Senator WALSH. How about July?

Mr. MORLEY. Seven hundred casks.

In August there were 403 casks, a total weight of 45,136 pounds.

In September there were 1,327 casks, a total weight of 148,624 unds.

In October there were 7,560 casks, a total weight of 846,120 pounds.

Up to November 10 there were 2,900 casks of Danish butter, 324 xes and 10 casks of Irish butter, a total weight of 344,064½ pounds.

Senator WALSH. Comparing the months since the emergency tariff came effective, is there shown a great decrease in importations?

Mr. MORLEY. There is a little explanation in connection with that. ou see, the heavy importations of last winter demoralized the market. The market went down in the month of June to 28 cents. That as caused by demoralization. New York dealers had put large antities of butter in storage. Of course, they lost a lot of money on . That was brought about by heavy importations of Danish butter ring the winter months.

Senator MCLEAN. What were those importations?

Mr. MORLEY. The importations for 1921 were 12,109,192 pounds, lued at—well, I figured those at 40 cents a pound.

Senator SUTHERLAND. You say for the year 1921?

Mr. MORLEY. Up to the 10th of November. The value was ,840,676.80.

Then, going back to the summer of 1920——

Senator WALSH. For the same period of time?

Mr. MORLEY. For the whole year. The total weight of imported itter received at the port of New York was 27,801,815 pounds, at a luation, figuring 61 cents per pound, which was the average price New York quotations for "extras"—the 92-point butter—of 16,959,107.76, making the total value of the butter imported into ew York from foreign countries; that is, across the water—I have t the figures on Canadian butter, although there is considerable of —$21,872,854.56.

Senator McLEAN. It seems that this butter was imported at a val-uation of from 40 to 61 cents a pound?

Mr. MORLEY. Sixty-one cents was the average price of New York extras. What we called extras is the 92-point butter.

Senator McLEAN. Is that duty-paid?

Mr. MORLEY. I am giving you the price of the butter.

Senator McLEAN. What was the price of the imported butter?

Mr. MORLEY. That would be practically the same, duty paid.

Senator McLEAN. Then the importations coming together with th large domestic supply affected the market?

Mr. MORLEY. Yes; it worked out in this way. When it comes comes in pretty large cargoes. To a certain extent, it has a senti-mental effect, but it does affect the market.

Senator McLEAN. Then the importers lose money equally with th domestic producers?

Mr. MORLEY. The importers did not lose money, because the butte is sold before it leaves. Oh, yes; they would be importers, that right; they would lose money, too. They lost money on this Cana-dian butter.

Senator WALSH. Do you claim that the emergency tariff which in-creased the rate has had a tendency to keep out the imported butte or not?

Mr. MORLEY. Well, we are looking for large consignments thi winter.

Senator SUTHERLAND. If the price goes up, that rate does n affect it?

Mr. MORLEY. No. I have been over to New York trying to g the situation over there.

Senator SUTHERLAND. There is considerable fluctuation betwe the summer and the winter prices?

Mr. MORLEY. Yes. The price this summer, as I said before, June went down to 28 cents.

Senator SUTHERLAND. There is always some fluctuation?

Mr. MORLEY. Yes; always some fluctuation.

Senator WALSH. But not as much as that?

Mr. MORLEY. No; not as much as that.

Senator WALSH. Notwithstanding the increase in rate through t emergency tariff, the price of butter has dropped during the summe

Mr. MORLEY. Yes; with the 6-cent tariff.

There were 2,900 casks of Danish butter unloaded last week in N York. Those casks contain 112 pounds each. That would be equ to twice that number of tubs. We ship it in tubs.

Senator SUTHERLAND. That is shipped in cold storage?

Mr. MORLEY. No; that is fresh butter.

Senator SUTHERLAND. I mean that it is in a refrigerator on its wa

Mr. MORLEY. Oh, yes; there is refrigeration on the vessels. Th is mechanical refrigeration on the vessels.

Senator WALSH. Have you figures of our exports during th months?

Mr. MORLEY. No, sir. I was rather surprised to hear of it.

Senator McLEAN. I assume those exports go to Cuba or Mexico

Senator WALSH. Mr. Loomis, where do we export to?

Mr. LOOMIS. To southern countries, tropical countries, chiefly.

Mr. MORLEY. There is another element in it that works against the ırmers of the West—the transportation rates. The different shiping points in Denmark can put butter in New York at a freight rate ' $1 per hundred. On the other hand, from our country, taking t. Paul as the zone, for instance, the rate is $2.15. Therefore, they ıve an advantage of $1.15 on freight.

Senator McLEAN. That is, a cent and fifteen one-hundredths per ound?

Mr. MORLEY. Yes; that is 1.15 per pound. That is quite an lvanatge in the matter of freight.

The conditions in the West among the farmers are a great deal ı has been told here about New England. There might be a little fference, because the farming there is more diversified, but everyıing else is worse than dairying. Now, if these $21,000,000 that ent to Denmark had gone into the West, they would probably have one considerable good.

We can not see any reason why our markets should be given over a foreign market when we are able to produce all that our people ant. We would like to see, as the others have said, the rate on itter made 10 cents a pound, and on other products corresponding.

We have the same condition in Minnesota, Wisconsin, North akota, Montana, and all along the line. We are right on the border. here is the same possibility of shipping cream into our country for ıurning purposes. I think the same discrepancy existed in the ayne-Aldrich bill, if I remember correctly. You see, there are some ırge churning plants in that part of the country that could easily t cream from over the line and make it profitable to buy the proıction in Canada. There is more or less milk produced in these estern Provinces in Canada. There is quite considerable produced Saskatchewan; probably it is not to the same extent as in Montreal; ıat country is now shipping to New York. I do know that Canadian itter is coming in in carload lots. It does not match up with the anish butter in quality. The Argentine butter is a lower grade itter, and so is the Canadian butter.

Senator McLEAN. In 1920 we imported 19,000,000 pounds of butter om Denmark at a value of more than $10,000,000; that is more than) cents a pound.

Mr. MORLEY. In 1920 we imported more than that.

Senator McLEAN. From Denmark?

Mr. MORLEY. Oh, no; not Denmark.

Senator McLEAN. I was speaking of Denmark.

Mr. MORLEY. From Denmark, in 1920, we imported 92,358 casks 112 pounds each. I do not have it figured out in pounds.

Senator WALSH. How much was the total importation in 1920 om all countries?

Senator McLEAN. It was 37,454,000 pounds.

Mr. MORLEY. For 1920?

Senator McLEAN. That is the total importation.

Senator WALSH. We exported 16,000,000 pounds.

Mr. MORLEY. The importations into the port of New York were 7,801,816 pounds, which, at a valuation of 61 cents per pound, ould be $16,959,107.76. That is at 61 cents per pound.

The largest proportion of the butter that goes into the city of ew York—and the same is largely true of Philadelphia—comes

from Minnesota, Wisconsin, Illinois, Iowa, and those western States. You take the posted receipts on the Mercantile Exchange in the morning, and I think you will see that 75 per cent of the butter that comes into New York comes from the West. There is a very small proportion from near-by points.

As stated by the gentlemen from New England, their butter goes mostly to Boston. Very little of our butter goes to Boston.

Senator McLEAN. Do you feel the competition of the vegetable-oil products, like coconut butter and cottonseed-oil butter?

Mr. MORLEY. We feel the competition after it is manufactured into oleomargarine.

Senator McLEAN. They call it butter, coconut butter.

Mr. MORLEY. Yes; they call it coconut butter or something of that nature.

Senator McLEAN. Do you feel that competition?

Mr. MORLEY. Oh, yes; but not so much when the price of butter is low as when the price of butter is high. When the price of butter is high they turn to oleomargarine and coconut butter. During the last year the consumption of that has been small. In fact, some factories have pretty nearly stopped its manufacture.

Senator McLEAN. What do you say as to the rates suggested by the witness who preceded you—Mr. Bronson?

Mr. MORLEY. That is what we would like to have. He has figured those rates out to correspond with 10 per cent on butter. We think that is perfectly reasonable. That is what we would like to have it. So far as the people I represent are concerned, 10 cents a pound on butter, with the corresponding rates on other products, would be satisfactory.

Senator McLEAN. Is that all?

Mr. MORLEY. That is all, unless you have some questions to ask.

Senator McLEAN. If you should think of anything later that you have not stated, you may present it to the committee, and the committee will have it printed in the record.

(Mr. J. R. Morley supplemented his statement to the committee by the following statement relative to the claims which had been made that supplies of cream were not available in this country for the manufacture of ice cream:)

I wish to add to my statements before the committee November 14. The question was brought up that there might be a possibility that sufficient cream could not be obtained for ice-cream purposes without going across the border. The cities of New York and Philadelphia have long since discontinued the attempt to obtain fluid cream for ice-cream purposes and have been using sweet butter; that is, butter manufactured without the addition of salt or artificial coloring matter. The sweet butter is homogenized or reduced to cream. By adopting this practice, they have an inexhaustible supply and at a less cost than undertaking to get the fluid cream. Whether they are using this method or not in Boston, I am unable to say. At all events, the [illegible] cream for ice-cream purposes is not an argument for admitting cream from Canada. The Minnesota Cooperative Dairies Association sold sweet butter to the Castle Ice Cream Co., at Newark and Perth Amboy, by the carload to be used for ice-cream purposes. No attempt is made by this concern to use any other supply.

After the passage of the Underwood tariff bill in 1913 importations of foreign butter began to come in from eight foreign sources. The breaking out of the war in [illegible] stopped this, and during the war we exported large quantities of butter to England. After the war and with a 2½-cent tariff and the rates of exchange being so much against all European countries, our market became very attractive. As a result, the importations mentioned.

In conclusion, we contend that the American farmer is entitled to the home market. The possibilities of our country to produce foodstuffs is unlimited and the necessity of importing foodstuffs will never come.

TATEMENT OF A. M. LOOMIS, WASHINGTON, D. C., SECRETARY OF THE NATIONAL DAIRY UNION.

My name is A. M. Loomis and I reside in Washington. I am secretary of the National airy Union. I am also assistant to Prof. T. C. Atkeson, Washington representative the National Grange, and am authorized by him to say to this committee that he pproves the requested amendment changing the rate of duty on butter from 8 to 10 nts a pound. The National Dairy Union is an organization of dairymen and butter anufacturers, incorporated under the laws of the State of Illinois December 18, 1903. he purpose of the organization is to promote the best interests of the dairy industry the United States.

THE BUTTER INDUSTRY.

The dairy industry is one of the great industries. The butter industry itself is vided into three distinct groups, all having a common interest in adequate tariff otection. One of these groups is the dairymen who make butter on their own farms. his in 1920 amounted to 675,000,000 pounds, representing over 14,000,000,000 pounds milk. The other two groups are those interested in factory production of butter, vided between the cooperative or farmer-owned factories and the centralizer or mmercially owned factories. These two produced in 1920, 863,500,000 pounds of itter, utilizing 18,000,000,000 pounds of milk. These three groups provided the arket for 36 per cent of all milk produced in the United States, provided nearly 15 unds of butter for every individual in the United States, and established the market ice at which the other 64 per cent of milk is sold.

The entire dairy schedule which will be or has been presented to your committee s been worked out on a scientific basis of equivalents based upon the 10-cent tariff hich we are asking on butter. There are many reasons for this, but the primary ason is that the price of butter in the New York City market is the largest single ctor in establishing the price of all dairy products in the United States, as will be own later on.

There are 24,720,000 dairy cows in the United States. There were 7,857 establish- ents, according to the Bureau of Markets, engaged in the manufacture of dairy oducts, with products valued at over $1,000,000,000. Half of this is the butter siness of the country. Dairy cattle are reported on four and a half million of the t and a half million farms reported in the 1920 census, and the estimate of capital vested in the farms where dairying is an important farm enterprise is estimated at er $55,000,000,000.

NEW YORK PRICE CONTROLS ENTIRE INDUSTRY.

It was stated that the rate of duty on butter is the basis of the entire dairy tariff hedule which is asked for and that the reason for this is that the price of butter is e controlling factor in fixing the price of all other dairy products, including fluid ilk. This is a fact which will be testified to by every person who appears before ou, no matter what branch of the dairy industry he may represent. Milk is sold in e Washington market on the basis of its butter-fat test, the price being fixed in cordance with the amount of butter fat in such milk. The great fluid organizations, ithout exception, in making up their estimates as to the asking price for their prod- ct, use the price of butter fat as the basis from which they start. I am not going into e reasons for this, although there are many good reasons, but will state this as a atter of fact which the dairy industry will generally substantiate.

For the purposes of this tariff discussion, we can narrow this price basis still further. he price of butter and butter fat in the United States is largely fixed by the opera- ons on one market, and that market is the New York Mercantile Exchange. There e many good reasons for this, which I will not discuss, but can state this as a fact, hich the entire dairy industry will substantiate, and that is that the largest single ctor in fixing to-day's price of butter anywhere in the United States is the price uoted to-day for 92-score butter on the New York dairy market. In a large way, e entire argument for a dairy tariff rests upon this single fact.

BUTTER TARIFF HISTORY.

In 1909 Congress in its wisdom established a butter tariff at 6 cents a pound. The rice of butter in the wholesale markets of the United States at that time ranged etween 20 cents and 40 cents per pound. This tariff continued in effect until 1913, hen a new law went into effect, fixing the rate of duty on butter at 2½ cents a pound, hich law had been in effect until the enactment of the emergency tariff bill last May.

Exhibit A is a table showing the imports of butter into the United States by fiscal years under these two tariff laws. The imports were negligible from 1909 to 1913. In 1914, the first year of the 2½ cents a pound duty, they jumped to nearly 8,000,000 pounds, or more than the entire period of the previous tariff law; 1915, 1916, 1917, and 1918 were war years, during which time countries which normally might have sent butter to the United States had other markets and greatly reduced production. In 1919 the result of the 2½ cents a pound tariff was again apparent with an importation of 4,000,000 pounds, which was multiplied by five in 1920 and still more greatly enlarged in 1921, when a total of more than 34,000,000 pounds of butter came into the United States, and the imports of 1920 and 1921 were far more than the total previous imports in the entire history of the country.

The emergency tariff law of 1921 went into effect within 33 days of the end of the fiscal year. After May 28, 1921, the imports of butter into the United States were negligible until the last few weeks. Imports in June amounted to 33,864 pounds; for July, 191,748 pounds; for August, 149,886 pounds; and for September, 397,[illegible] pounds. During October 7,560 casks (about 825,000 pounds) of Danish butter arrived in New York City, while 10,000 boxes reached San Francisco from Australia, about 500,000 pounds.

This situation is very significant, as it demonstrates that while the 6 cents tariff was effective for all necessary purposes before the war, when the normal price level of butter was approximately 25 to 30 cents a pound, this rate of duty is not sufficient or satisfactory on the present price level of butter.

WHY TARIFF IS NEEDED.

It is apparent from the figures here quoted that the total imports of butter are small as compared with the domestic production of butter. In the largest importing year the ratio of imports to domestic production was about 1 to 43, the imports amounting to not quite 35,000,000 pounds and the domestic production to a little over a billion and a half pounds.

The question then naturally arises, If the imports are so small, why is a comparatively large duty asked for or needed?

The answer to this question is twofold. First, it answers itself, for if there is so little butter imported, it demonstrates that we do not need any to be imported and can produce all we need ourselves, and that a duty of any kind or size will work no hardship on any of our own people; second, that the duty on even a small amount which does come in is needed because of the peculiar market conditions in this country which have been referred to—the dependence of the entire industry upon the New York price and the even balance between production and price in this country because of the purely competitive situation, so that a price protection in the New York market is absolutely required to protect this American industry, just as a general price protection is needed to protect any other manufacturing industry.

SMALL SHIPMENTS HAVE LARGE RESULTS.

The comparatively small shipments of butter reaching New York have large results in the prices paid for American butter everywhere. The New York price is controlling in all markets. Every price fluctuation in New York is felt directly and definitely back to the check the farmer gets for his milk or cream from which the butter is made which reaches the market in the period affected by this special shipment into New York. Butter is made every day. It is an expensive commodity. The industry, by and large, is organized in small units, strictly competitive. The butter must be sold from week to week by these small units "on the market." They are dependent upon the market price.

A single cargo of Danish butter reaching New York last year in July depressed the market from 59 to 55 cents. A cargo in January depressed the market from 57 to [illegible] cents. In only one instance did the market fail to react downward when [illegible] shipments reached New York and that was in April during the railroad strike, [illegible] 4,000,000 pounds came in and saved New York from a butter famine, but during the following month the market reacted from 75 to 66 cents a pound.

CONSTANT INFLUENCE ON MARKET.

I have prepared a careful abstract of the report of the Bureau of Markets of the United States Department of Agriculture covering the butter market for the [illegible] calendar year of 1920 and the present year up to the date when the emergency tariff

:nt into effect, showing the weekly fluctuation in prices, the amount of imports aching New York, and the comments of the official reporter of the United States overnment in the New York market, which I will file as Exhibit B. This shows that January, when under the normal conditions butter prices should be advancing to ver the greatly increased cost of production and handling at that season, 500,000 unds of Danish butter and large shipments of butter from Argentina and Holland ched New York and the price broke from 71 cents January 3 to 64 cents January 31. ipments continued to arrive, the largest one coming in April, when the railroad ike was in progress. This combination disrupted all ordinary market rules. New rk had such an acute shortage that even the 4,000,000 pounds of Danish butter had no ect and prices soared to 77 cents a pound in New York, while Chicago was selling m 10 to 12 cents under the New York price. In July there was a break from 59 55 cents at a time when butter normally does not decrease in price, due to the arrival over 7,000,000 pounds of Canadian, Danish, and Argentine butter, culminating in illion pounds of Danish butter reaching New York during the week of November and nearly a million pounds more during the week of the 25th. This price decline ntinued during January, February, and March of this year—declines almost unheard n the history of the dairy industry. I can not better illustrate the whole damage e than by quoting from the Market Reporter, the official publication of the United tes Department of Agriculture for the week ending February 5, when a decline rom 50 to 46 cents was registered. The Market Reporter says:

'Severe decline attributed to arrival of foreign stocks. The greater weakness was sed by the surplus of foreign butter arriving at New York. Danish which arrived previous week proved of excellent quality and many buyers took it in preference lomestic, so long as it could be purchased at or below domestic price. This caused h a backing up of regular arrivals that receivers simply had to drop prices to a point re Danish competition would be cut. The declining market, of course, kept buy- down to a minimum. Further arrivals of Danish are expected."

CONSUMER DOES NOT GET BENEFIT.

he buying public does not get the benefit of these price fluctuations.

he results of imports in the New York market as shown is to make the market ven, subject to sharp ups and downs. These declines and advances reported in ry day's wholesale quotations are reflected back to the producer in every instance, they are not reflected forward to the retailer except in part, and by the retailer he consumer in still smaller part. A continued decline is, of course, finally smitted to the consumer, but the whole trend of modern retailing is to retard lines in retail prices, to sell on buying price and not on replacement cost on a lining market and on replacement cost instead of buying price on an advancing ket. Every member of this committee knows that this is true.

ur demand for a tariff is a demand that Congress take action on the one factor in blishing prices of butter and dairy products over which it has any influence, so t the price finally established by all the factors will be as favorable to the pro- ers of butter as possible. The price of butter is fixed by a composite of many es, among them being the price of farm land, the cost of feed, the season of the r, the price of farm labor, the price of beef, the weather conditions, the credit ation, the movement into and out of storage. All of this amounts to what is ed domestic supply and demand. The farmers must perforce take their chances his situation, and there is no industry in the United States in which supply and and has a freer play, and less artificial interference than in the butter industry. price of butter every day in the year is a free competetive price, and this of f protects the American public against any exploitation by or because of a tariff. the dairyman and the butter producer are asking is that this condition of free com- tion be left alone, and that his market be protected by Congress in the only single or over which Congress has any possible effective control, namely, to protect market against surprise shipments, sudden influxes of unexpected and not needed gn butter, which unsettles markets, and causes violent fluctuations, hurting lucers, with no consequent help to consumers.

PRODUCER SUFFERS HEAVY LOSSES.

he daily production of butter in the United States is about 5,000,000 pounds. single shipment of Danish butter reaching New York has depressed the market nts a pound, and this depression has continued for three or four weeks before a e recovery takes place. That is, the price the producers of 5,000,000 pounds of

butter gets each day for perhaps a month is 3 or 4 cents a pound on the average lower than it would have been if one single million pounds of butter did not reach New York from Denmark or the Argentine or some other foreign country. In other words this single shipment, valued at perhaps three or four hundred thousand dollars, cost the American dairymen between one hundred and fifty and two hundred thousand dollars a day for the entire period of three or four weeks while the market was unsettled, or perhaps a million dollars a week for a minimum of three weeks.

TARIFF WILL STABILIZE MARKET.

We are making this demand for an adequate tariff on the single proposition that our market must be stabilized. Consumers have the same interest as producers in the stability of the market for any commodity. Immediately upon the fact becoming patent that butter marketing is to continue subject to the fluctuations noted above, which continued until the 6-cent tariff became effective in May, and have now been resumed, every butter receiver and dealer will take steps to protect himself against these fluctuations, and this will take the form and has taken the form of increasing his own margin, as insurance against the added risk. The consumer must pay this. As soon as the producers learn that they, too, are hit hard by these wild market ups and downs, they, too, will take steps to protect themselves. This will be a slow process and will take the form in the main of still more dairymen going out of business because they can not make it pay under this additional risk and burden.

COW POPULATION IS DECLINING.

The final argument for any tariff is to prevent an industry from going out of business. Consumers of butter have just as big a stake in preserving the American dairy industry at its present level, or a still greater one, as those engaged in the industry itself, for the price of butter is purely competitive. To permit the industry to decline further means inevitably higher priced butter, until the reaction downward is counteracted. A table has been prepared showing the decline in dairy-cow production in the United States in recent years, and is attached hereto as Exhibit C.

This shows a decline from 287 cows per 1,000 persons in 1840 to 237 in 1900, a decline of 50 per 1,000 in 60 years, or nearly 9 per year. It shows a further decline of 237 per 1,000 in 1900 to 218 per 1,000 in 1921, a decline of 13 per 1,000 in 21 years, or 6 per year during even the high-price war period.

DEALERS PROTECT THEMSELVES.

The influence of surprise shipments on prices is shown with special emphasis in Exhibit D, a table showing average prices of butter in the two months of November and December for the past 10 years. Everyone knows that these are the months of increasing shortage of production and increased cost of production, hence normal price advances are expected and required. This normal reaction happened in every year of the 10 except 2. Those two were the years 1914 and 1920. Nineteen hundred and fourteen was the only year the 2½-cent tariff was in effect before the war, and 1920 the only year it was in effect after the war when large shipments reached New York during those months. In each case these shipments resulted in violent fluctuations, reaching a depression for the two months of 1 cent in 1913 and over 8 cents in 1920.

This is what takes the heart out of butter producers and the butter trade. No dealer who withstood the slump of last November and December—and there were those who did not withstand it—will enter that kind of a market again unless he protects himself by seeing to it that he gets a bigger margin all the time to protect himself against such fluctuations.

SUMMARY OF ARGUMENT.

In closing let me sum up this argument.

The whole dairy industry in the United States rests on the daily price of butter in the New York market.

This industry is one of the largest and most essential in the Nation.

Experience shows that lack of proper tariff protection leads to imports of butter inconsiderable in amount as compared with the production and consumption in the Nation, but viciously effective in disrupting and demoralizing the one market which establishes national prices.

The interest of the consumer of butter and the producer of butter will be best served [illegible] stabilizing butter prices as far as may be, and to do this it is necessary to put a [illegible]ity in effect which will minimize the surprise shipments and their influence in [illegible]ammering down New York market prices.

Under a 2½-cent tariff this influence was at its worst.

A 6-cent tariff corrected it up to a certain point, but surprise shipments are now [illegible]ming in, and greater protection is needed.

The dairy and general agricultural interests agree that 10 cents is not too much to [illegible]k at this time.

EXHIBIT B.—*Effect of imports of butter on the market.*

[Market Reporter.]

Week ended—	Market price.	Imports.	Remarks.
1920.	*Cents.*		
Jan. 3	71 -69½	Danish, 300,000 pounds	
10	69½-65	Danish, Argentina, and Holland.	Foreign offerings, 59½-61.
17	65 -62	Danish, 200,000 pounds	
24	63-65 -62½		
31	64-62 -64		
Feb. 7	66-67 -66	Danish	Danish butter low as 50½ cents.
14	66 -66	do	The arrival of Danish butter relieved the shortage but boded ill for shippers and dealers.
21	67 -67½	Danish, 690,000 pounds	Receipts still below previous week.
28	65½-65	Danish and Canadian	Large quantities of storage stocks and arrivals [illegible] quired to prevent price advance.
Mar. 6	64 -64½	Danish, 720,000 pounds	Brokers are selling new consignments; as a result prices actually ranged lower than Chicago.
13	65½-67½	Danish and Canadian	In spite of large stocks of Danish and Canadian there was a shortage.
20	67½-68½		New offerings of Danish for future shipment around 56-57 cents.
27	68½-66		Little justification for the decline.
Apr. 3	66 -67	Danish, 4,000,000 pounds	Supplies were short.
10	67½-73		Strike served to cause shortage.
17	75 -72		Chicago selling 10 cents under New York.
24	73 -77		12 cents over Chicago.
May 1	73 -64		Storage drawn heavily.
8	63-64½-63		
15	62½-62½		
22	64 -61½	Danish, Holland, and Argentina.	
29	61½-60	Holland and Finland	
June 5	60 -55	Holland, Argentina, and Canada.	Butter going into storage.
12	56-57½-56		Fancy butter short on most markets.
19	56 -58		Receipts about 25 per cent lighter than last year
26	58½-59		Some of the foreign butter being stored.
July 3	59 -58	Canadian and Danish (light)	Storage less than last year.
10	57½-58		Surplus of undergrades.
17	57½-56½	Danish, Canadian, and Argentinian, 5,089,280 pounds.	Felt on New York market and reflected to [illegible] markets.
24	57 -56	Danish, 1,574,000 pounds	Danish butter largely put in storage.
31	56 -55		Prices declined; weak and unsteady.
Aug. 7	56 -54	Danish	Oversupply.
14	54½-55½		Danish in storage moved at 52¾. Holdings of [illegible] act as check. As soon as prices advance the [illegible] drawals become numerous.
21	55½-56		Surplus in undergrades.
28	56½-57	Danish	
Sept. 3	56 -57½		Danish offered from 55 to 56 cents. Holders of [illegible] ish ready to sell.
11	57½-58½		Shortage in fancy. Surplus of undergrade
18	58 -60		Danish selling at 3 to 5 cents below.
25	60 -62	Danish, 201,600 pounds	
Oct. 2	62 -61½	Danish and Argentina	Fresh Danish selling at 55 to 57 cents. Argentine [illegible] 50 to 51 cents.
9	62½-61		Undergrades serious problem, spread 13 to 16 cents [illegible]
16	61 -59½		Holdings heavy, new shipments arriving.
23	59½-57		Centralized butter hard hit and drops 5 cents at [illegible] cago.
30	58 -62		Raise due to jobbers, wholesale grocers, etc., [illegible] depleted stocks.
Nov. 6	62 -64		Fancy butter scarce, firm demand well above [illegible] cents. Danish not more than 54 to 56 cents. [illegible] offerings of Danish under 48½ f. o. b. New [illegible] does not help instill confidence.
13	64 -65	Danish, New Zealand, and Canadian.	Offerings of Danish at 51 cents but no [illegible] shown.
20	65 -65	Danish, Argentina, and New Zealand.	Danish at 6 to 8 cents below looked attractive. [illegible] offerings reported at 51½ to 52½. Argentine [illegible] at 40 to 45 cents, poor.
27	65 -57	Danish, New Zealand, Canadian, and Argentina.	Slump of 5 cents Friday. Foreign butter [illegible] ness. Fresh Danish 55 to 58 cents. New [illegible] at 62 cents. Canada at 61 cents. New York [illegible] ing at 8 cents below.

EXHIBIT B.—*Effect of imports of butter on the market*—Continued.

Week [e]nded—	Market price.	Imports.	Remarks.
1920.	*Cents.*		
[D]ec. 4	57 -51½	Danish	Increasing use of Danish stock a factor in downward trend. Fresh arrivals the only other factor. The policy of dealers was to sell at any price that would interest buyers.
11	52 -53½	Danish, 1,000,000 pounds	A fluctuating market is the best that can be expected for some time.
18	54 -55		After a month of weak and unsettled conditions, butter has taken an upward turn.
25	55½-56	Danish, 860,000 pounds	A good demand for Danish butter at 51 to 52½ cents.
1921.			
[Ja]n. 1	56 -57	New Zealand, 792,000 pounds	Foreign butter still a factor.
8		Danish and Dutch	
8	57 -53½	Danish, 145,600 pounds	Weakness on top grades, largely result competition foreign butter.
15	53½-52	Danish, 2,000,000 pounds; New Zealand, several cars.	Danish butter as low as ee; light receipts of fancy grades; market uneven and unsettled.
22	52 -50	Danish, 2,100,000 pounds; New Zealand, several cars.	Real weakness lay in expected arrival of Danish butter.
29	49½-49½	Danish, small shipments	Danish importers refuse to sell offerings at a loss. New Zealand still offered at 47 to 48.
[Fe]b. 5	50 -46	Danish, very heavy	Severe decline attributed to arrival of foreign stocks. The great weakness was caused by the surplus of foreign butter arriving at New York. Danish which arrived the previous week proved of excellent quality and many buyers took it in preference to domestic, so long as it could be purchased at or below domestic price. This caused such a backing up of regular arrivals that receivers simply had to drop prices to a point where Danish competition would be cut. The declining market of course kept buying down to a minimum. Further arrivals of Danish are expected.
12	44 -44		Recovery followed as soon as butter was cleared up. Shortage developed. Danish stock cleaned up.
19	45 -48		Do.
26	49 -52½	Danish arrivals	Do.
[Ma]r. 5	53½-53		Three vessels carrying butter expected to arrive.
12	53 -47½	Heavy Danish and New Zealand.	Weakness continued.
19	47½-45	Danish and New Zealand	Arrival of Danish stocks held accountable for severe break during recent weeks.
26	45½-46½		Receipts light.
[Ap]r. 2	44½-49½	Danish	Storage caused upturn; receipt of Danish stocks discontinued and withheld from markets; offerings limited.
9	51½-49		Reacted downward under heavy receipts.
16	49½-45		Market remained either unchanged or advanced fractionally through the week until Thursday, when New York weakened unexpectedly and declined 1 cent, causing other markets to follow; the decline was caused partially because about 10,000 casks of Danish butter was still unsold on the market.
23	46½-41		New York prices on Danish held until Apr. 22, when they cut 1 cent under the market. Buying in all markets was practically on a day-to-day basis.
30	40½-35½		5-cent break at Chicago.

RESOLUTIONS.

DES MOINES, IOWA, *November 8, 192[illegible]*

A. M. LOOMIS,
Secretary National Dairy Union, Washington, D. C.

Following resolution adopted by Iowa Creamery Secretaries and Managers' A[illegible]ciation November 3 representing cooperative creameries of the State:

"*Resolved*, That we earnestly request the Congress of the United States to imp[illegible] tariff requirement of 10 cents per pound on all butter imported into the United Sta[illegible]

W. A. WENTWORTH, *Secre[illegible]*

By Chairman Balderston of the committee on tariff schedules:

Whereas it has been distinctly and conclusively shown by data carefully compiled by competent authorities that a tariff of 10 cents per pound on butter was absolutely necessary in order that the dairy industry may prosper in the United States: Therefore be it

"*Resolved by this conference of the representatives of dairy associations assembled in uffalo, N. Y.:*

"1. That we respectfully urge upon Congress that the above-mentioned rate of aty on butter be agreed upon in the final passage of the pending tariff law.

"2. That we insist and urge all our constituent and allied interests to insist that the ntire dairy product schedule must be on a parity with the rate of duty on butter. 'e approve the entire schedule suggested by the United States milk producers' airy tariff committee, which was based on the comparative market value of the arious constituents of whole milk and is as follows: Milk, 3½ cents per gallon; cream, i cents per gallon; butter, 10 cents per pound; cheese, 5 cents per pound; conased milk, 2 cents per pound; casein, 5 cents per pound.

"We would call attention to the fact that casein has been overlooked by the Ways nd Means Committee. The American manufacturers of this by-product can not ist without proper protection.

"3. That any protection the dairy industry may receive by a tariff on dairy prodts themselves will be very largely negatived if there is not a duty on edible vegeble oils at least equal to the tariff on butter fat. We would urge that there be placed tariff on copra not less than 50 per cent of the rate of duty placed on vegetable oils. e also recognize the importance of these oils in the industries and arts and would ggest that importers and refiners be allowed a suitable rebate on all such oils that e denatured and used for any purposes other than human food."

Moved by Mr. Pattee, seconded by Mr. Holman, that the resolution be adopted as ad. Carried.

A. M. Loomis, *Secretary*.

Approved:

Milo D. Campbell, *Chairman*.

DDITIONAL STATEMENT OF A. M. LOOMIS, WASHINGTON, D. C. REPRESENTING THE NATIONAL DAIRY UNION.

Mr. Loomis. The committee has been very courteous to the dairy dustry in giving us this chance to finish our case. I am going to ke but a few minutes, as there are two other witnesses who want be heard. I suppose the committee will sit for a half hour or an ur longer.

Senator Smoot. You covered your subject very well before.

Mr. Loomis. I also represent, for this particular matter, Prof. C. Atkeson, Washington representative of the Washington Grange, ho has indorsed the position which we are taking here, and that in asking you to change the 8-cent item in the butter paraaph, 709, of the Fordney bill, to 10 cents, and this is the basis of e entire dairy schedule which is being asked for by other branches the dairy industry.

Senator Dillingham. That was agreed upon by the national sociation?

Mr. Loomis. Yes; recommended by all branches of the dairy indusy. I have here a letter which has just come to me, which I will t read, signed by W. A. Wentworth, secretary of the Iowa Creamery cretaries and Managers, in which he says just recently all the dairies the State of Iowa have indorsed this 10-cent tariff request.

Senator Smoot. How is it they have changed their minds from the st testimony?

Mr. Loomis. That is in accord with a telegram which is here, dated ovember 21; but this is in complete detail, giving names of other

organizations, and since November 21, when we had the previous hearing, the creamery organizations of the States of Minnesota, Wisconsin, and New York have also gone on record in favor of the 10-cent item.

We ask this tariff to prevent a disaster to the dairy interests of the United States such as has already overtaken the large part of the other industries in agriculture.

And in that connection I want to call your attention, without filing for the record, to the report of total value of the crops for the Unit States for the year 1921, which was issued this week, and to call you attention to the crop value totals in the United States to show wha has occurred to agriculture in the last few years in the most concre form in which it has ever been announced.

The total value of the crops for the United States for the year 1919 was in round numbers $13,600,000,000; in 1920 the value of th crops was $9,075,000,000. This year they are $5,600,000,000, or falling off in the two years of $8,000,000,000 in value from a total o $13,600,000,000. That is what has happened to agriculture in th United States.

Senator Gooding. What is the size of the crop?

Mr. Loomis. That is the total of the crops which are comput from the crop reporting service of the Department of Agricultur.

Senator Smoot. For those two years?

Mr. Loomis. For those two years.

Senator Jones. How does the quantity of the product compa

Mr. Loomis. There was a small decline this year, but only a sm decline in prices. $13,600,000,000 was the total for 1919, a $9,075,000,000 for 1920, a decline between those two years of a lit over $4,000,000,000, and they have declined over $9,000,000,000 $5,500,000,000 this last year.

Senator Dillingham. That is dollars, but not in quantity.

Mr. Loomis. That is in dollars, but the quantity figures are he

Senator Jones. The quantity was practically the same?

Mr. Loomis. The quantity was practically the same—it will c within 10 per cent.

The butter industry in this period is one of the few industr which has not suffered so serious a decline. The chief reason, think, for that—a reason which to me seems the chief factor—is t fact that in the early part of this year there was 6-cent ta enacted through the emergency tariff law.

Senator Smoot. How is it they still charge 70 cents for ordin and 85 cents for first-class butter?

Mr. Loomis. I can not answer that question, because I am buy my butter cheaper than that.

Senator Smoot. Where do you buy it?

Mr. Loomis. At the grocery around the corner from my hou where I am getting butter at 60 cents, first-class creamery butter.

Senator Smoot. I get mine from George Oyster, and I assure y I do not get it at 60, 70, or 80 cents.

Senator Dillingham. Perhaps, as some witness suggested yes day, the fault is with the purchaser.

Senator Smoot. Perhaps so.

Mr. LOOMIS. I want to call your attention to the chart prepared y the Dairy Division of the Department of Agriculture, with the xception of the red line. [Exhibiting chart to the committee.]

The black lines indicate the balance of trade, the exports and nports. The black lines to the right of the center lines represent utgoing exports, and the lines on the left-hand side represent nports.

If it had not been for the imposition of the butter tariff, it is evi- nt—and that is what the red line says—that the imports of butter is year would have been the largest in the history of the United ates, because we have four months this year upon which to figure. hat 6-cent dairy tariff stopped in the period of low prices in this untry—that is, in May and June of this year—and that 6-cent riff checked the flow of imports.

As soon as we get into the cold weather, into the time of high- iced butter, the 6-cent tariff proved to be entirely unprotective, d we are now getting a disorganized butter market from the flow of ports, which is the reason that we come here asking to have the ents raised not only to 8 cents but to 10 cents.

If it were not so late in the afternoon, I would like to read a part the extracts from the official report of the Bureau of Markets to ow that within the past four weeks in at least six daily reports of Bureau of Markets of declines of the New York butter market is orded, and in each case definitely either the imports which have n received at New York or the cables of lower offers have been ponsible for them.

want to call your attention to the fact that this time of year we receiving the butter from the Southern Hemisphere, which is their iod of chief production, and at the present time there are large ports of butter received in San Francisco and the west coast from stralia and New Zealand, and large imports are arriving at New rk City from Argentina, which are the disorganizing influences.

n my brief which I filed on November 21, and which I wish I ld call to your attention again, I discussed the influence of those ign shipments upon the New York market, and the point about t is that the butter prices of the United States are largely gov- ed and the chief factor is the New York butter quotations of each , and the fact that those butter shipments center in New York ses fluctuations in the New York market which are out of all pro- tion to the size of the shipments, and that is immediately trans- d back through the country until every butter man in the United tes feels the depressing effect of it.

s to the size of this industry, I want you to realize that we are of the class of small industries which have been taking much e, it is 1,600,000,000 pounds per year, and on the basis of present es has a value of something like $600,000,000. So that a fluc- tion of a cent or two in the New York market caused by the re- t of Danish, Holland or Argentine butter has translated back ugh the entire United States on the basis of a production of not than 5,000,000 pounds of butter per day in this industry.

ADDITIONAL BRIEF OF A. M. LOOMIS, WASHINGTON, D. C., REPRESENTING THE NATIONAL DAIRY UNION.

The National Dairy Union appeared in cooperation with other dairy in
before the Senate Finance Committee last week, urging amendments to the For
tariff bill now before the Senate, increasing the duty on butter to 10 cents a pou
and providing a schedule for all dairy products on the basis of a protection on butter
content relative to 10 cents a pound on butter.

J. R. Morley, of Owatonna, Minn., presented the argument for the National
Union, speaking also as a Minnesota farmer and as president and manager
Minnesota Cooperative Dairies Association.

A. M. Loomis, secretary of the National Dairy Union, filed a brief and a
of exhibits covering a study of the influence of Danish, Argentine, and New Zeala
shipments, particularly on the New York daily prices, upon which all dairy
in the United States are directly or indirectly based, showing that these
shipments are demoralizing, and the great need of the dairy industry is for stab
conditions.

An abstract of this brief follows:

After indicating the number of persons engaged and the amount of money inv
in the dairy industry and the butter industry which would be benefited by
tariff as requested, the brief took up the following points:

We are asking this tariff particularly to protect the New York dairy market
demoralization and fluctuations to stabilize the dairy industry of the entire count

It is not the amount of imports which might come in under a low tariff to
we object, but the influence of these imports in causing severe fluctuations in
market out of all proportion to their size, which fluctuations cause great los
producers and few, if any, benefits to the consumers.

The price of butter and dairy products throughout the United States is fixe
the daily New York quotations.

1. Butter is sold everywhere on New York basis. This is general trade pr
2. Cream buyers establish the price of cream on butter sales.
3. Cooperative factories pay members on the basis of butter sales.
4. Fluid milk prices are fixed in every large city on butter-fat basis, with the p
of butter fat as the major factor, and that fixed by New York butter prices.

All dairy authorities will agree on this thesis in general.

The influence of the New York market price is absolutely controlling and
price is absolutely competitive. Butter is made and sold in national and internat
competition and price agreements are impossible. Manufacturers of cheese and
other manufactured milk products are forced to pay for the milk at a price com
tively level with price paid by butter manufacturers because of the large siz
the butter industry.

Domestic butter is made and marketed in a comparatively even flow.

1. Butter is a purely agricultural product and like all other agricultural pro
(and unlike fabricated products), can not be controlled as to time and volume of
duction.

2. Bureau of Markets figures will show comparatively level movement of butt
market, affected only by seasonal conditions.

3. Price movements, when not affected by heavy or unexpected imports
comparatively small seasonal fluctuations, moving up in winter and down in sum
in accordance with the amount and cost of production.

Foreign shipments come in in large, often unannounced and unexpected quanti

1. Bureau of Markets daily and weekly reports show this to be true, and that
people know of arrivals, which therefore have effect of surprise offerings.

Influence of these foreign shipments is disastrous.

1. Bulk of foreign shipments come to New York City, affecting first and
seriously New York prices, which control the prices all over the country.

2. Shipments from Denmark are always large and sold in such manner as
organize New York market. (See Bureau of Markets reports.)

3. Shipments from Southern Hemisphere, Argentina, and New Zealand are
and cheapest in winter when American farmers are producing the least butter
highest cost, and consequently are most disastrous to American markets.

If further proofs of these self-evident facts are needed, they will be found
fact that during the year 1920 when the imports were the heaviest in the hist
the butter industry, the New York market was in constant fluctuation, entir
of all proportion to any changes or variations in the cost of or amount of dom
duction. Receivers suffered heavy losses in addition to still greater losses
back to producers. An exhibit is attached containing an abstract of the
of Markets of the United States Department of Agriculture on the New York

ırket January 1, 1920, to May, 1921, (when the emergency tariff went into effect) ıe fluctuations amounted to as much as 7 cents a pound downward in a single month. :e Market Reporter, April 19.)

Lower prices are passed back to producers.

!. A single import shipment of butter drives market prices down as long as that tter remains in the market, during which time the whole American production 5,000,000 pounds a day brings the producer only the lower price.

!. Cheese factory, butter factory, and condensory prices are adjusted to this basis. tter and cheese factories sell at regular intervals at these lower prices and settle h patrons upon the market price basis.

'hese price reductions are not passed on to the consumers except in small part.

. Retail price quotations in any city in the United States during the period of the ressions of the winter of 1920 and spring of 1921 will show this to be true.

. The general practice in retailing is to base selling price upon actual cost price in lling market and upon replacement cost in a rising market.

mports are not needed to supply the American market.

. Even during the inflated period of imports of 1920 and 1921, butter imported ounted to only from 1 per cent to 2 per cent of the American production—55,000,000 nds in 1920 and 1921 as compared with domestic production of not less than 3,200 lion pounds.

. During this same period 35,000,000 pounds was exported, and heavy losses were ed by inability to dispose of surplus stocks in storage at prices above cost.

'nsettled conditions result in steady decline in the industry.

. While there was only a decline of 3 cows per 1,000 people in the United States ing the war period when there was a large exportation of butter, there has been a line since the war of 5 cows per 1,000 people during the period of imports.

. Statisticians of the Dairy Division of the Department of Agriculture estimate t the falling off in exports and the increase in imports of dairy products since the e of the war has been almost exactly balanced by the decline in the number of y cows kept for milk in the United States.

en-cent tariff needed.

A 6-cent tariff was effective under prewar conditions, butter then being worth 25 cents to 30 cents a pound, with labor and equipment in proportion. Butter ow worth 48 cents a pound. Last year's average 61 cents a pound.

Six cents in emergency tariff proved effective only during the low price period ıne, July, and August when butter averaged about 35 cents a pound and is not :tive now, as shown by increasing imports.

en-cent tariff justified by difference in cost of production and is a fair ad valorem

Canadian costs, as shown by experts, are 10 cents a pound, less than American ı.

Danish butter supplants Canadian butter in English market; therefore Danish ı must be as low or lower than Canadian costs.

When the 6 cent tariff was effective it was equal to a 20 per cent or higher ad rem tariff on a basis of the 25 or 30 cent value of butter at that time. A 20 per tariff now would amount to 10 cents a pound or more. No protective rate in the e Fordney bill is figured at less than 20 per cent ad valorem.

SUMMARY.

e whole dairy industry in the United States rests on the daily price of butter in New York market.

is industry is one of the largest and most essential in the nation.

perience shows that lack of proper tariff protection leads to imports of butter, siderable in amount as compared with the production and consumption in the on, but viciously effective in disrupting and demoralizing the one market which blishes national prices.

e interest of the consumer of butter and the producer of butter will be best served tabilizing butter prices as far as may be, and to do this it is necessary to put a ' in effect which will minimize the surprise shipments, and their influence in mering down New York market prices.

der a 2½-cent tariff this influence was at its worst.

e dairy and general agricultural interests agree that 10 cents is not too much to at this time.

POULTRY AND EGGS.

[Paragraphs 711–713.]

STATEMENT OF KNOX BOUDE, PETALUMA, CALIF., REPRESENT-ING AMERICAN POULTRY ASSOCIATION AND EGG MARKETING ASSOCIATIONS.

The CHAIRMAN. Where do you reside, Mr. Boude?

Mr. BOUDE. I reside at Petaluma, Calif.

The CHAIRMAN. What is your occupation?

Mr. BOUDE. My occupation is that of a farmer who specializes in poultry. My farm is devoted to two products, poultry and apples. I am a specialist in poultry.

The CHAIRMAN. You speak for the American Poultry Association, do you?

Mr. BOUDE. Yes, sir. I represent some nine associations— Pacific coast cooperative associations of Washington, Oregon, and California; the American Poultry Association, which is the general association of the United States; and in respect to the tariff on eggs and poultry I have been given permission to present the views of the American Farm Bureau Federation and also of the National Grange.

The CHAIRMAN. Very well; will you proceed in your own way and inform the committee of your views?

Mr. BOUDE. Gentlemen, the American hen lays approximately 1,767,000,000 dozen eggs per year that find their way to the market from the farmers to the consumers. Another 500,000,000 dozen used upon the farms and in the various processes of incubation. that we have had a surplus during the past few years, and there been an exportation of 10,000,000, 20,000,000, and 40,000,000 do eggs per year. The amount paid for eggs to the farmers—the producers—in the United States was $782,000,000, and for poultry $441,750,000, making a total of $1,223,750,000. These figures ap to the last two years.

Senator LA FOLLETTE. What was that figure for poultry that you just gave us?

Mr. BOUDE. $441,750,000. In the matter of railroad transportation, there was hauled last year 251,350 carloads. In giving fig I do not take the highest estimates as reported by the Department Agriculture. We have not included the 500,000,000 dozens that were used on the farms for edible purposes or for purposes of incubation. I believe the Department of Agriculture places a value $250,000,000 on those eggs. So that the total figures for last year product are in excess of $1,500,000,000.

Senator WATSON. That does not include those sent by express, does it?

Mr. BOUDE. I could not say. There are some phases, Senator, which it is hard to get statistics. But the figures of the department are larger than my figures; so I think that we are conservative. It is a very large industry, because it concerns about 90 per cent the farms in the United States. The Government has fostered industry through the agricultural experiment stations and fo ways and means to increase the average yield per hen. But the remains that one important factor in the marketing of eggs is t

e hen produces eggs only about nine months in the year. The win- season is taken for a time of rest and growing a new set of feathers. The only solution that we have so far found to the process of dis- bution is cold storage. In the spring there is an enormous excess oduction, and from the daily accumulations sufficient quantities sent to cold storage to be distributed in an orderly manner during cold months, when fresh eggs are scarce and exceedingly high.

The CHAIRMAN. Is there any accumulation during the winter sea- n at all?

Mr. BOUDE. There is no accumulation during the winter. That curs only during the spring.

The CHAIRMAN. Absolutely?

Mr. BOUDE. Absolutely; we can get a few sport hens and pullets m which, if we house them and give them heat and a great deal special care and attention, we can get a limited supply, which nstitutes our source of fresh eggs for winter.

Senator LA FOLLETTE. Have you any statistics that show exactly production in the winter months?

Mr. BOUDE. I do not think I have. But just taking my ordinary ck it is about 20 to 30 per cent—20 per cent usually. Occasionally u will get an unusually favorable winter, where some of the spring nditions are reproduced. Then if those conditions are extra good u can get up to 30 per cent.

Senator LA FOLLETTE. About 30 per cent?

Mr. BOUDE. Thirty per cent is the limit; usually 20 per cent.

Senator MCCUMBER. Thirty per cent of the spring production?

Mr. BOUDE. Thirty per cent, provided you raise sufficient pullets, ich are very expensive to raise; that is, in the process of repro- ction, their eggs being used for incubation.

Senator MCCUMBER. That is where you would have mild weather?

Mr. BOUDE. Yes, sir.

Senator MCCUMBER. That would not be true in the North Central ates at all, would it, where they have long winters and cold nters?

Senator LA FOLLETTE. It all depends on how they are kept, nator.

Senator MCCUMBER. I assume that.

Senator WATSON. What is the extent of importation?

Mr. BOUDE. The importations rose in 1914, following the enact- nt of the Underwood-Simmons Act, to 6,000,000 dozens per num. Importers on the Pacific coast announced that they uld make an annual price of 15 cents per dozen, f. o. b. cars San ancisco, and offered yearly contracts. However, the war broke t, and the boats were taken off the Pacific, so that importations re prevented during the war period.

Senator WATSON. Where from?

Mr. BOUDE. They were brought from China at the rate of about 00,000 dozen per annum, but fell one year to 1,333,000 dozens. st year imports increased, and this year during the first eight nths there were 2,620,640 dozens imported. During the same riod eggs in frozen and dried form, aggregating 9,018,665 dozen, re also imported and came in competition with the American oduct. The Government statistics do not state the dried product

separately from the frozen, but each pound of dried eggs imported would represent approximately 3 pounds of fresh eggs.

The CHAIRMAN. Are these Chinese eggs imported over here in pretty fair shape?

Mr. BOUDE. They are getting them here in better shape all the time.

The CHAIRMAN. I would expect that they are a little spoiled, some of them.

Mr. BOUDE. They can remove the spoiled ones by candling and sell only the best ones to the public. The Chinese eggs are six weeks old and in some cases two months old when they arrive.

Senator WATSON. At what cost are they laid down?

Mr. BOUDE. I am going to put in evidence in a few moments the prewar prices of sending Chinese eggs as reported by our consuls. Here is a report of an investigation made by the University of Oregon. It shows that the costs before the war were from 2 to 6 cents per dozen as paid by exporters over there, or importers here, whichever way you wish to put it.

The following data, showing the very low prices at which eggs may be obtained from the Chinese producers in the various districts, are taken from reports of the United States consular officers at the principal egg markets of China:

Hankow (seaport): During the past five years the price of eggs has materially increased; in some districts it has more than doubled. This depends to a large extent upon the proximity of the producer to Hankow, where are located the manufacturing plants. Another important factor in the increase in the price of eggs, as well as other articles, is the method adopted by a British cold-storage plant here, which carries in cold storage to Europe game, poultry, eggs, and meat. This company sends out purchasing agents to collect eggs regularly in certain districts, which creates a ready local market for all the output and that at a maximum price.

The summer price of eggs, as ascertained from 20 localities, varies from 140 to [illegible] eggs for a Mexican dollar (40 cents United States currency), dependent upon the remoteness of the district from the large markets and the accessibility to transport.

During the season (that is, in the spring) eggs can be bought for less than 8 Hankow taels (approximately $5.29 United States currency) per picul of 133⅓ pounds. The number of eggs per picul varies from 1,200 to 1,500; thus, the price per dozen would range from 4.23 to 5.59 cents (United States currency). The average price is between $5.29 and $5.62, but it rises to $5.95 in the winter months.

Nanking (seaport): Eggs are purchased by the local exporters here at prices ranging from 40 to 42 cents per gross and are being consigned to the United States as follows:

Fresh, per dozen	[illegible]
Frozen, in tins, per pound	[illegible]

The rate of exchange and supply may ultimately cause some variation in the [illegible]. Thus far, however, the exporters have experienced no difficulty in securing all they can handle—about 25,000 dozens per day.

Shanghai (seaport): A few years ago the price throughout the year at the open ports on the Yangtze averaged 4 to 5 cash each. This is the equivalent in United States money of approximately 2 cents per dozen. The abolition of these old copper cash, however, and the substitution of 10-cash pieces (or cents) resulted in raising prices in general.

There are five grades of eggs on this market, the grades being by size of eggs. The larger eggs are intended for export. The up-country prices fluctuate constantly, and it is not possible to give even a season average. The egg-product factories buy by weight. The lowest price by weight (mixed grades) works out at about $6.50 Mexican for 1,000 eggs, or about $3.15 United States currency. Egg-product factories do not find it practicable to work when the price in the interior is more than about [illegible] Mexican (say $4.35 United States currency) per thousand.

Of the larger eggs, the up-country prices in the winter months run from $11 to [illegible] Mexican per 1,000. In summer, they are as low as $9 Mexican.

The egg prices fluctuate, of course, with the demand, and the heavy shipments to the United States have had something to do with increasing prices. Prices during the winter of 1913–14 ranged from 10 Shanghai taels (approximately $6.32 United

ates currency) to 17 Shanghai taels (approximately $10.75) per 1,000. To these ices must be added freight and charges, the latter including cases and fillers, packg, export duty, wharfage dues, insurance, and incidentals, averaging in the neighrhood of 1 tael (approximately 63¼ cents United States currency) per case.

The eggs are purchased by agents of the Shanghai retail produce merchants, who sit the farming localities at regular intervals for this special purpose. The eggs are en transported to Shanghai by rail, canal, or river shipments. The farmer generally lls his eggs at about $4.60 (United States currency) per 1,000. Of course, this price dependent upon the supply and demand and fluctuates accordingly. The transrtation charges are usually defrayed by the Shanghai merchant, who resells the gs to local exporters at various prices ranging from $6.25 to $8 (United States curncy) per 1,000. This price also fluctuates, but these figures are approximate. The porter, in turn, sells the eggs to his clients abroad at prices mutually arranged for her by contract or agreement. The cost of crating, packing, insurance, etc., are ually borne by the exporter.

Tsingtau (seaport): The prices vary constantly, being lower in summer than in nter. This office has no accurate data on the prices paid for eggs by the collecting ddlemen. From information obtained from local Chinese, however, it seems evint that eggs thus purchased probably cost from 2 cents to 5 cents (United States rrency) per dozen. They are small eggs.

Tientsin (seaport): The average prices paid by the exporters at the present rate exchange are from 20 to 40 cents (United States currency) per hundred, the procers being paid slightly lower prices.

Hankow (seaport): To-day (Sept. 2, 1915) fresh eggs sell in the market at about 900 sh (35 cents United States currency) per 100, and this is at least 25 per cent above e market price of five years ago. It can not be considered exorbitant, though se eggs are very small.

Canton (seaport): The following prices, in gold, are asked (May 20, 1915) per 1,000 chicken eggs by the wholesale dealers at Canton: Large, $9.10; medium, $8.40; all. $7.82. The prices are, of course, subject to fluctuation as exchange rises and ls.

Swatow (seaport): The price in the interior is about 5½ cents and in Swatow 7½ nts per dozen. In summer, when exportation is scarcely feasible, the price is lower.

Chefoo (seaport): With the introduction of railways into Shantung, the organizan of cold-storage facilities for the shipment of foodstuffs abroad, and the erection factories for drying and condensing eggs for foreign consumption, prices have risen ormously. Fifteen years ago $1 in United States currency purchased about 900 s about 1.3 cents per dozen). The lowest price, or rather the price at that season the year when eggs are most plentiful, is now 360 for $1, or about 3.3 cents per zen.

Harbin (inland): In general, the price of eggs in the Harbin market is 50 cents, ld. per hundred, in large quantities. They retail to the consumer at from 7 to 9 nts, gold, per dozen. It is believed that the farmer receives an average of approxitely 30 cents, gold, per hundred for his eggs.

Hongkong (seaport): Prices of ordinary lots early in March, 1913, ranged from 24 to $6.72 (gold) per thousand, fluctuating between comparatively narrow margins m day to day. During 1912 the highest price in the Hongkong market, wholee, was $6.68 (gold) per thousand.

The report of the Dominion Department of Agriculture for the ek of August 1–8, on page 4, contains the following in regard to inese bulk eggs:

The Paris health authorities have been inquiring into the advisability of using inese eggs in the making of cakes and pastry and have come to the conclusion that ring the hot weather the use of these eggs is dangerous. Chinese eggs are imported o Europe without their shells, being frozen and packed in kegs. Analysis shows at 24 hours after they have been thawed, a single teaspoonful of the mixture conns 36,000 harmful microbes.

M. Martel, the health inspector, who has been conducting the investigation, recmends that pastry cooks and restaurant keepers should be forbidden to use Chinese s, except for biscuit making, where the very high temperature is sufficient to kill e germs. Private consumers, of course, have never been used to Chinese eggs, ich are only sold in bulk.—Teuter, London Observer, July 24, 1921.

Senator WATSON. And do you know what the cost of a dozen eggs ould be from China laid down in Chicago.

Mr. BOUDE. I had prepared to touch on that a little later, when I brought up the matter of transportation costs.

Senator WATSON. I was trying to find out what the real competition of the American eggs was with the Chinese.

Mr. BOUDE. I will make just a few statements about the econom condition. In the spring of the year eggs always fall below the co of production upon the farms. This condition has always obtaine. During that time, of course, the consumer is protected for other portions of the year by cold storage. The eggs go in storage at lo prices, so they can provide a later supply at higher prices during th following fall and winter.

We have asked for a protection which will run uniformly at 8 cen per dozen upon shell eggs, which I am speaking of in this instan because we believe that that will come somewhere near the differen between the cost in America and the cost abroad. We originall asked for 10 cents a dozen, but we have reduced these figures to cents, because we have declining markets all over the world an declining silver which is a factor in Chinese trade.

The prices at Shanghai, prewar, were around 6 cents, as I hav already submitted in the report of the University of Oregon. Wi an 8-cent duty and 5-cent freight rate, which is the ordinary oce rate to Seattle, Portland, or San Francisco, that would enable the to lay eggs down at 19 cents per dozen. The price of eggs or the co of eggs in America has not been settled by the Department of Agri culture or the various departments of the universities. Some of th universities are now making surveys, and I assume the Departme of Agriculture is. We ordinarily took 25 cents a dozen as prew cost of producing 1 dozen eggs, when you reckon all the yea factors that have to do with the cost.

For 23 years, gentlemen, beginning with 1890, shell eggs were the protected list. They bore 5 cents a dozen duty during th time, except for three years, from 1894 to 1897, during the Wils Gorman or Wilson-Vorhees Act, when they were 3 cents a dozen.

Australia puts a tariff upon eggs of 12 cents a dozen, which is pr hibitory to us. But during their season, which is the reverse of ou they ship eggs to the United States.

They also have an embargo against Chinese eggs, for the benefit the home producer and the encouragement of home production.

Senator LA FOLLETTE. Did you give the total importation of eg for eight months? I understood you to give the figures.

Mr. BOUDE. Yes, sir.

Senator LA FOLLETTE. I mean the importation into this coun from all countries for eight months, or was that limited to China?

Mr. BOUDE. This is as reported by the Department of Commer up to September 1.

Senator LA FOLLETTE. And takes in all of the importations?

Mr. BOUDE. 2,620,643 dozens in shell alone, not including dr and frozen.

Senator CALDER. I was not here during the early part of y testimony. Can you give the committee the quantity of eggs im ported from Canada?

Mr. BOUDE. Yes, sir. The importations and exportations bac and forth across the border last year were practically equal, bein 215,000 cases of 30 dozen each. They have an import duty upon

gs of 3 cents a dozen, and the minister of agriculture at Ottawa so has the power to embargo the importations of Chinese eggs wheneer in his judgment it is against the interests of the Canadian pro-cers for them to be received.

Senator CALDER. And the duty at 3 cents a dozen in Canada ainst our eggs?

Mr. BOUDE. Against our eggs; we have none on theirs.

I wish to call attention to the fact that the Department of Agrilture, the universities, and the colleges have done all that they ssibly could to encourage the production of eggs in the United ates.

I wish to lay down just a few fundamental arguments——

Senator CALDER (interposing). Just before you get to that, did you ate the total amount of eggs exported from this country? Have u those figures?

Mr. BOUDE. I have not, but there is a gentleman to follow me who prepared to give those figures in detail.

Senator CALDER. I would like the record to show what quantity eggs were imported and what quantity of eggs were exported.

Mr. BOUDE. Prof. Rice, of Cornell, is here and will follow me. has charts showing this. He has made an academic study of whole situation and, Senator, he will present it to you. I am ly a farmer-producer, and am presenting this statement on behalf the producers.

I want to submit the following arguments as to why we should have adequate tariff of 8 cents a dozen: The Chinese eggs in shell, zen, and dried sell in competition with the American eggs, and ery egg that is imported from China displaces an American egg, cause we are producing a surplus, and ultimately, if you carry this t to its conclusion, it displaces the American hen and the American oducer.

The Chinese standards of living are entirely different from ours, d the American standard of living is high, and we are trying to rease or at least retain the American standard of living upon the m. We are pointing out that it is a desirable thing because of our ndards of living that we retain the present high production and put tariff upon the Chinese imports. Every Chinese egg sold is sold a price necessarily below the price of the American egg, and therere the American farmer can not compete when prices are cut.

Senator SMOOT. Are they as good as the American eggs?

Mr. BOUDE. They are inferior. So they cut the price and break markets where our eggs are sold.

Senator MCCUMBER. For cooking they answer the same purposes?

Mr. BOUDE. Oh, yes; they answer the purposes of a cheap egg. e are not going on record as desiring an embargo in the way of a iff, gentlemen. It just follows as a natural sequence that if we rmit too many of our farm products to be sold at a loss—this has en brought out by those appearing on behalf of wool and wheat d other things that are oftentimes sold at a loss—that it is going have an injurious effect upon our agriculture, and we wish to do that we can to keep agriculture upon the best possible basis.

I want to call attention to another thing that is an economic loss. ur American market is already overloaded with eggs. An effort is w being made to export 500,000 cases of the present surplus in

cold storage, because it is feared we have too many. The foreign markets, the rates of exchange—everything is against the exporta-tion of these eggs.

Senator CALDER. That may be so, but still the markets for cold-storage eggs keeps up in price pretty well, does it not?

Mr. BOUDE. That is because of a scarcity in fresh-egg production; they bid for the fresh eggs instead of using the eggs that have been stored for the normal consumption.

Senator CALDER. But in New York we are not getting our cold-storage eggs much cheaper than the fresh eggs, are we?

Mr. BOUDE. They took them away from us farmers at around [illegible] cents.

Senator CALDER. We are paying something like 65 cents to-day.

Senator CURTIS. I am paying 76 cents for fresh eggs.

Senator SMOOT. I am paying 85 cents for fresh eggs.

Senator CALDER. I want to help the farmer, but I also represent a city which is a great consumer of eggs.

Senator LA FOLLETTE. What is the farmer realizing for eggs to-day?

Mr. BOUDE. I recently looked up the quotations at the Kansas City market. I could not find the Omaha markets. The Kansas City market was around 50 cents for fresh and 40 cents for cold-storage eggs.

Senator LA FOLLETTE. That means after the eggs are delivered to the commission merchant?

Mr. BOUDE. That is what they are asking f. o. b. cars Kansas City, which is in the heart of the egg-producing district.

Senator LA FOLLETTE. Are you a farmer?

Mr. BOUDE. I am a farmer, yes, Senator, and I have no other method of making my living except on the farm.

Senator LA FOLLETTE. What are you realizing on the eggs that you are marketing to-day?

Mr. BOUDE. My wife wrote me that she was receiving 60 cents per dozen.

Senator LA FOLLETTE. Where did you ship from?

Mr. BOUDE. I sell at Petaluma, Calif.

Senator SMOOT. I paid 85 cents for them delivered at the house to-day.

Senator CURTIS. I bought 30 dozen last week at Topeka and had them shipped here, and they cost me laid down in Washington, after paying express, 66 cents a dozen—fresh eggs.

Senator GOODING. Your eggs go direct to the consumer, do they not?

Mr. BOUDE. There is a regular channel of distribution. We have never been able to break over that. We have to use the middleman.

Senator CALDER. The people in the centers of population are not able to go to the middleman. Take New York City, with 6,000,000 people. The farmers do not sell direct to us; their eggs go through two hands—two middlemen.

Mr. BOUDE. It is a study, gentlemen. I hope you can solve it some day. We are willing to do anything in the world to meet you and to study it out. I have studied it in California. It is a very difficult matter.

Senator SMOOT. Is it not a question of distribution rather than a uestion of importation? For instance, in the nine months ending eptember you exported 21,195,249 dozens of eggs, and we imported uring that same period only 2,707,933 dozen; and that is only bout one-seventh of 1 per cent of the importations as compared ith the exportations.

Mr. BOUDE. Precisely, so far as eggs in the shell are concerned.

Senator SMOOT. And is it not a question of distribution in this untry rather than a question of importation under a protective riff?

Mr. BOUDE. I can not agree with you, quite, Senator, in this way: nina is the largest potential egg producer in the world. In the last ur or five years she has increased her export trade by leaps and unds and especially since we put more boats on the Pacific. They l have refrigerator space available. We are wrestling with the oblems of deflation, and the fact that the farmer is not getting hat he used to get. It is simply a question of what China can do to , not entirely what she has done just yet, but what she is going on do. They assure us that they are able to put the American producer out of business.

Senator SMOOT. What do you ask for?

Mr. BOUDE. We ask for 8 cents on shell eggs.

Senator CURTIS. I want to add right there—and I think Mr. Mercer er there will probably recall the instance—in 1914 an importer of gs from China who lived in San Francisco came to Kansas City, o., and offered to sell eggs there at 10 cents a dozen.

Mr. BOUDE. On contract?

Senator CURTIS. Yes, sir.

Senator CALDER. A moment ago you said you were receiving 60 nts a dozen for your eggs?

Mr. BOUDE. Yes.

Senator CALDER. You do not want protection on those eggs, do u? Is not that enough?

Mr. BOUDE. But we are not getting at my place enough eggs to ore than meet the cost of our feed, because the flock is not laying ry much right now.

Senator SMOOT. Under the existing law it is 2 cents a dozen; ıder the Payne-Aldrich law it was 5 cents, and the House bill has ven you 6 cents, and you want 8 cents?

Mr. BOUDE. We want 8 cents. Under the Underwood-Simmons t shell eggs are free; frozen eggs are 2 cents.

Senator SMOOT. Eggs in the shell?

Mr. BOUDE. Eggs in the shell are free at the present time.

Senator SMOOT. I guess not.

Mr. BOUDE. Gentlemen, just a word about transportation. I wish call your attention to certain matters about rates. We pay from her Seattle, Portland, or San Francisco a rate of $3.33 per hundred unds to New York, which is the great consuming market in the nited States. That amounts to about 6 cents a dozen. When the izzards come, we are obliged to ship by express, because the spring mes quicker on the coast, and if there be any shortage it is just then at you need the eggs. So if they are shipped by express it is uble that, and it costs $6.66 a hundred, or about 12 cents per dozen.

When they ship Chinese eggs in train loads, as they came in last winter—they bring them to Seattle, Portland, and San Francisco and send them across—there is a rate of $2.60.

Senator LA FOLLETTE. What is their rate delivered at Seattle?

Mr. BOUDE. Their rate is between 4 and 5 cents, I understand, at the present time. But they are reducing the rate all the time. It is only about 6 cents through the Canal to New York, if they send them that way.

There was a point I want to bring out as to this compensatory duty in the way of transportation upon the imported Chinese eggs of 73 cents per hundred, which amounts to $146 on a carload of 20,000 pounds. I confirmed these figures with Chairman Clark when he was chairman of the Interstate Commerce Commission, so as to have them accurate before we should attempt to give them to anyone.

I just wanted to bring out one thought about it, that the importation of 8 dozen eggs or 8 pounds of frozen eggs puts an American hen out of business. At the present time these importations that we have received—importations particularly of frozen eggs—the gentleman who succeeds me is going to speak especially on that subject—with the shipload that is coming through the canal now for New York, there will be about 32,000,000 pounds of frozen eggs on board in storage.

That represents the product of 4,000,000 hens. That is only an example of what China can do to us if we permit these eggs to come without an adequate duty to protect the American producer.

Senator GOODING. Do you know anything about the average price of eggs in the Middle West during the month of April, May, and June of this year—the price the farmer was getting?

Mr. BOUDE. It ran from 10 to 12 cents, I understand, in Texas, Oklahoma, Kansas, and parts of Missouri. Of course, there was a high freight rate. The New York price fell almost to 20 cents. You consider the high transportation charges that would cause prices to decline at the farm to a greater extent.

Senator GOODING. Ten or fifteen cents a dozen to the farmer.

Mr. BOUDE. Yes, that would be about it.

I have presented the phase of the shell egg, gentlemen. The gentlemen who follow me will present the facts of the frozen egg and the dried egg. We are dividing the time and hoping not to repeat our facts and arguments.

STATEMENT OF HARRY LEWIS, DAVISVILLE, R. I., REPRESENTING INTERNATIONAL BABY CHICK ASSOCIATION AND AMERICAN POULTRY ASSOCIATION.

Mr. LEWIS. I reside at Davisville, R. I.

The CHAIRMAN. You are a farmer?

Mr. LEWIS. Yes, sir; a poultry and dairy farmer.

The CHAIRMAN. Will you state your views to the committee?

Mr. LEWIS. As Mr. Boude, the previous speaker, has just mentioned, in order to save the time of you gentlemen and not repeat, I am going to confine my remarks entirely to questions concerning the dry egg and the frozen egg.

First, just a word about quantity. It is unfortunate that the report of the Department of Commerce does not distinguish in detail as between importations of dry and frozen eggs, but from the

tatistics we have available it is a pretty good estimate to say that etween four and five million pounds of dried eggs are imported into he United States out of 25,000,000 or 30,000,000 pounds which the epartment reports in the form of frozen and dried eggs; in other ords, probably one-fifth come in in that form.

These importations came in last year. They have steadily been icreasing since 1914, and the evidence is that they will be much irger this year.

Just a word as to quality. Dried eggs are prepared from whites, olks, and the whole egg, or mixtures of whites and yolks. I do not now but what you gentlemen have seen the products to which I am ferring. In case you have not, I will give you a little of this so ou can see it [exhibiting sample of dried eggs to the committee]. I ould not advise you to follow the example of my stenographer the ther day, when we opened one of these boxes. Womanlike, she oistened her finger and dipped it into the dried egg, and she said ie has not wanted to eat an egg since. That is nothing against the iality, however, as in that form it is not very tasty.

The CHAIRMAN. What is that? [Referring to sample.]

Mr. LEWIS. That is dried egg. That is the form in which it is put it in commerce, primarily for the use of the housewife.

Senator SMOOT. What is it worth to-day per pound?

Mr. LEWIS. I do not know what it is selling at retail, but in conact prices anywhere from 90 cents to $1 a pound.

Senator SMOOT. And this bill provides 15 cents a pound?

Mr. LEWIS. Yes, sir.

Senator SMOOT. And the Underwood bill 10 cents?

Mr. LEWIS. And we are asking for 24 cents on the dried egg.

Senator SMOOT. What is a dried egg worth in China to-day?

Mr. LEWIS. The product, you mean?

Senator SMOOT. Yes.

Mr. LEWIS. Of course, that is made from shell eggs, which I rerred to, which are about 8 or 10 cents a dozen, and as it takes 3 zen eggs to a pound of dried egg, the process is approximately three mes that.

Senator SMOOT. The invoice prices on the last dried eggs that came from China was 16 cents per pound?

Mr. LEWIS. The desiccated eggs can not be as universally substited for shell eggs as the frozen product, because "lifting power" the white is partially destroyed by the process of drying. This roduct is used in large quantities in what is termed by the bakers flat baking." This product is used primarily in the preparation of ome foodstuffs, although it has other uses in this country in the ting of dyes for cotton cloth, and in making certain medical preparaons for skin treatment, etc.

From the best information we have the following facts apply rearding the prices, and the commercial uses of dried albumen are ipidly increasing in the United States. The product usually sells this country for 90 cents to $1 a pound.

The rate in the Fordney bill as reported by the House is 15 cents er pound specific duty on all three products—the dried albumen, ie dried yolk, and the dried whole egg. The American Poultry Asciation is asking the Senate Finance Committee to raise the rate 24 cents per pound, specific. Ordinarily it has been found true

by firms engaged in the business of drying eggs that 3 dozen shelled eggs make 1 pound of dried or desiccated eggs. There is an overrun, it is found, in the case of American eggs, which run somewhat larger and better in quality. The tariff rate of 8 cents per dozen on shelled eggs is in the proportion of 24 cents per pound on dried or desiccated eggs.

There are just two or three points I want to bring out in connection with the dried-egg situation in the way of argument for the tariff which we request. It is very evident from a study of the situation that in the last few years, due to the development of this industry in China, the industry in this country which previously existed on a fairly strong basis has almost entirely been destroyed, and I quote you figures from the United States Department of Agriculture to show proof of that [reading]:

> During 1918 the average price of fresh eggs in the United States was 48.45 cents per dozen, as compared with 12 cents in China. Labor costs are also considerably higher in this country than in China. Several years ago there were considerable quantities of desiccated eggs manufactured in this country. However, as a consequence of the comparative cheapness of Chinese labor and raw material, most of the machinery in these factories has been shipped to China for use in plants operated by American capital and under American management. Most of the dried product shipped into this country by these concerns is handled by their home agents.

The machinery for drying and desiccating these eggs is, a great deal of it, owned and patented by the firms carrying on the process.

In other words, as a result of the development of the Chinese egg supply, the drying industry in this country has practically been done away with.

Senator SMOOT. That is on account of the use of the frozen egg more than the dried egg?

Mr. LEWIS. Both to quite an extent. Probably the frozen-egg industry in this country has not been injured to quite the same extent as the dried-egg industry has.

Senator SMOOT. That has been increasing right along?

Mr. LEWIS. The main point is that the American egg is cheap enough to make this business profitable in this country even in spite of the tendency to import extensively from China.

As mentioned a little while ago, the prices received in the Southern States, and for some 10 or 12 weeks during the last spring of 192[illegible] the price of shelled eggs in the States of Texas, Oklahoma, Kansas, Missouri, and Nebraska ranged about 12 cents a dozen. This was down to substantially prewar level.

If they can freeze and dry eggs profitably in China at these prices, may we not do it also in this country?

The object in asking a tariff upon dried eggs is to induce the men engaged in buying and shipping eggs in these western and southwestern States to establish drying and freezing plants, using the American product and employing American labor. A protective duty of 25 cents per pound would be a material inducement to American business men to reestablish this industry in this country, and it does not seem to us a bit unfair to make the rate at that point.

Senator LA FOLLETTE. Do you know about what time the market dropped to 10 or 12 cents?

Mr. Lewis. Yes; in the spring. You see, the hen, as Mr. Boude reviously mentioned, lays eggs primarily to reproduce herself. Then we operate a poultry farm we are commercializing the reproductive functions of the hen, and the natural egg-laying season of the en is in the spring months. It is that season of the year that the rms of this country provide the great bulk of eggs which must rry us through for 12 months, and it is the one season of the year hen eggs are very, very cheap; and if it was not for refrigeration id methods of cold storage, of course, we would be paying fabulous ms for eggs this time of the year and we would get the eggs which ere laid in the spring at nothing; they would be worth nothing on e farm. So it is in the natural breeding season, in the spring onths, that the price reaches the lowest level, when the hen is oducing at the maximum.

The farm hen does not produce to any extent outside of that time. iere are a considerable number of eggs produced in country poultry nters on the east coast and west coast during the winter, but it is ly by very careful, painstaking methods, by immense investment equipment and by a great deal of training and experience that at can be accomplished, and it is only those very few eggs proiced in those sections that bring those fancy prices we have been eaking about; those who must have fresh eggs and pay for them gh prices when only a few are available. When you stop to think all the eggs consumed in New York City in a year less than 5 r cent are known as "near-by," you get some idea of how small a oblem the fresh egg is in this poultry problem throughout the nited States.

Senator Calder. Nevertheless, the market on cold-storage eggs lds up pretty well, does it not? I know that in New York we are t getting our cold-storage eggs much cheaper than the fresh eggs.

Mr. Lewis. Possibly so; and justly so, because it costs quite an m to put eggs in cold storage and keep them there. There is also big element of loss connected with it; the possibility of overproducn and the prices not holding up as they would otherwise; and if it is not for the cold-storage eggs, the probability is that you could t buy eggs for any sum at the present time.

The point I make is that the industry is doing us a service by oviding eggs for us at this time when we could not get them unless ld-storage products were available. In other words, it is equalizing e supplies, which is, of course, the thing that we are most familiar ith to-day.

The other point that I want to make is that we have in this country ough eggs for this purpose, so that it is not necessary for us to go China or to any other country to get our supply, and I quote rther from the Department of Agriculture report, "that, at the rate annual consumption in the United States of dried and frozen eggs, one-half or two-thirds the shell eggs annually produced in the ate of Texas were so prepared the product would more than pply the demands of the United States."

That seems rather a big statement to make until you study the oduction of a big State like Texas, which is one of our heaviest oducers of eggs in the spring months. The eggs produced annually the States of Texas, Oklahoma, and Kansas would, if dried or ozen, more than supply this particular trade in the United States.

The reason I mention that is that the argument is often made that we have not in this country enough eggs to meet the situation and to supply our own needs. But if one-half to two-thirds of the Texas supply were frozen, we would have enough for our own needs, and adding the other States, we would probably have enough of that product to supply the needs at the present time. Of course, we appreciate and anticipate that the industry of freezing and drying is going to increase and become more and more a factor in providing food for the American people as well as people in other sections of the world.

Another point which we want to consider is that the United States Department of Agriculture has made a careful study of this problem and the cost of manufacture, and the methods of manufacture are in a way no secret; bulletins have been prepared and a great deal of study has been devoted to the problem. So that our capital in this country can be used for that purpose. It is not a secret, although all of these practices, of course, are improved from time to time by secret processes.

In conclusion, I want to say that it is reported that a prominent importer stated that the average duty cost under the present tariff of all of his importations of dried eggs in all forms was 5 cents per pound. It is unofficially reported that a single small egg-drying plant was operated in America during the season of 1921, it being that of Swift & Co., at Wichita, Kans., out of a large number which operated previous to that time. The importations have greatly increased during the past six years, and there is a negligible home production of dried and frozen, although there is a considerable surplus of shell eggs produced in this country. It is apparent, therefore, that only an adequate duty will enable the business of drying eggs to be reestablished in the United States and be brought back and restored to the position which it formerly held.

It seems to me, gentlemen, that one of the things we want to do in balancing our agriculture is to try and make this country self-supporting and, so far as possible, independent of outside sources of supply.

Senator SMOOT. Do you agree with some that the drying of eggs is going to pass away and the freezing of eggs become the future method of handling them?

Mr. LEWIS. No; I do not think so.

Senator SMOOT. Which is the best product?

Mr. LEWIS. From the standpoint of nutritive value there are extensive studies being made at the present time on the dried product to determine the effect of drying the vitamine content. So far as nutritive properties—protein, fats, etc.—are concerned, there probably is no difference. But eggs, together with milk and other products which the farmer produces, have recently been found to possess a group of properties which we call vitamine, which are very essential to growth and development of the human race. Milk in butter fat and no doubt the fat in the egg yolk are very rich in these elements.

Senator SMOOT. They are not destroyed by drying?

Mr. LEWIS. No.

Senator SMOOT. Nor by freezing?

Mr. LEWIS. No.

Senator SMOOT. That quality remains the same?

Mr. LEWIS. Practically the same, but there is a destruction of the tamine in one of these, which is fundamental. But scientists are orking on it.

I was at a conference the other day with a doctor from Johns Hopns, where they have come to believe that one of the soluble vitanes in eggs was destroyed by heating, but the food value so far as tritive content is concerned is not injured.

So much for the dried-egg situation. Now, just a few words out the frozen eggs.

The grades of eggs principally used in drying and freezing are racked, dirty, and what are known as seconds." That is, an egg ich, in this country, can not be sold as first class for consumption. In the future it may be possible——

Senator CURTIS (interposing). They sell them to bakeries, do ey not?

Mr. LEWIS. To some extent, but they can not all be used up in period of production; they must be held over in some way, ich is best done by freezing.

Senator LA FOLLETTE. Are those seconds selected at the time ey are fresh?

Mr. LEWIS. Eggs are frozen at the time they are fresh or comratively so. They are broken, separated into yolks and whites, d frozen.

The problem of any country that attempts to standardize eggs is e disposition of seconds. Canada is facing that at the present ne. She has a very careful, complete, and well-worked-out eggading law. Putting that into effect has enabled her to largely pture the select-egg trade of England, but she has an immense oblem on her hands with those seconds, which she can not export, d these must be frozen or put into shape as best to be used by e trade.

In the future it may be possible and advisable during the spring ason, when there is a large production and prices rule low, so that e eggs can not profitably be shipped to other markets, to both y and freeze some of the better as well as the inferior grades in the est and Southwest. With high rates of transportation and labor entiful, an economic condition is created which will have to be ken into consideration in the development of a helpful governental policy. In other words, we do not for a minute wish to courage home breaking and freezing of eggs. But in view of the t that we have sufficient product to meet the needs it would seem though we need not be compelled to fight against this oriental mpetition, which is developing very rapidly.

With the prospect ahead of securing enormous profits through inese frozen and dried eggs with a nominal duty of 2 cents per und upon frozen and an average duty of 5 cents per pound upon ied, about the time of the passage of the act of October, 1913, the minating firms preparing these commodities abandoned the nerican producing fields and deliberately transferred their activis to China. The industry of freezing eggs has declined here since at time. On account of the increasing production in the United ates of shell eggs there are necessarily large quantities of under-

grades and checks, particularly in the producing season, and the spring surplus of this commodity is always difficult to sell, because the presence of a great quantity of first-class, high-grade stock on the market is naturally more attractive to the buyer.

Just a word about the rates. A tariff of 8 cents per pound is requested by the producers upon frozen eggs to America, which is the same rate which we request on shell eggs, for the simple reason that it takes it pound for pound; in other words, they are equal in reference to bulk or volume. The same reasons and the same arguments that apply to the request for a 24-cent tariff upon dried eggs apply almost invariably to the 8-cent rate requested on frozen eggs. It is ordinarily claimed that 1 dozen shell eggs make 1 pound of frozen eggs.

Senator WATSON. What is the difference between the cost of freezing and drying?

Mr. LEWIS. Freezing is a much less costly operation.

Senator WATSON. I supposed so.

Mr. LEWIS. It does not require the complicated machinery nor the trained labor.

Senator WATSON. What is the difference?

Mr. LEWIS. I can not give you the exact cost. I think that has probably been worked out and will be presented by Prof. Rice.

We feel that such a tariff law will give us back normal production and will at least approach the difference between the mere cost of living here and the cost of living in China. We certainly do not want to reduce our poultry producers and farmers to a condition of pauperism by compelling them to compete with Chinese labor. That may be exaggerating, but it certainly has a tendency in that direction.

I have just a few figures on the question of the cost of manufacture. The investment required for the profitable breaking of eggs is not large, although the Department of Agriculture will require the observance of certain sanitary regulations, all of which will result in the production of a high-grade product in this country. And there is a point I think we ought to remember, that the product which we get from this country, broken and frozen in our own breaking establishments, is manufactured under governmental supervision and certain sanitary precautions required, while when that same product is manufactured in China and shipped in here in a frozen state we have not the evidence or the assurance that the product has been produced under as sanitary conditions as it should be nor with the care that it should be.

In this matter of labor charge in the freezing of eggs, one of the large importers is reported to have stated that under favorable circumstances this had been only 1 cent a pound in their American plant. However this may be, in establishing a new industry by business men it sets a standard of efficiency and for economy. In other words, the breaking of eggs and the freezing of eggs can be done in a very economical and efficient manner at relatively low cost. After being broken the eggs are poured into cans holding about 50 pounds each and are then sent to the freezer. It is stated that until recently the cost of the can added 2 cents per pound to the cost of the product. Even after the customary business overhead is added to these figures, it will be seen that the cost of manufactur-

ıg is small. The eggs bought for manufacturing purposes at Shangai at 12 cents per dozen during the war were sold on yearly con'acts in the United States to the baking trade at approximately 5 cents per pound. Now that eggs are falling in price at Shanghai 6 and 8 cents per dozen, the frozen product is being contracted American bakers by the importers upon yearly contracts at about) cents per pound. This certainly looks like very attractive and 'ry remunerative business.

Just one or two arguments now in definite support of 8-cent tariff: First, our own production has been very definitely stifled by this 'iental trade. The fact that the importers have selling agencies in l of the principal cities of the United States and are prepared to :tend long credit, offer yearly contracts at flat rates per pound, and aintain ample supplies of frozen canned eggs in cold-storage ware)uses all over the country ready for immediate delivery, places the ıking trade of the country in the position of being absolutely 'pendent upon the importers for supplies.

In other words, they are assured of an immense supply through ıis source.

Speaking in plain words, we might say that the importers absotely have control of the trade through their ability to bring in this ımense quantity by contract with the bakeries a year ahead.

We have evidence, which is certainly interesting, to show that there es not seem to be a demand for the product produced here, for a ımber of reasons: On account of the tremendous production cost of gs in this country in the spring of 1921 there was a large supply of ıdergrades suitable for freezing and considerable quantities of the merican product were incidentally manufactured. In consequence this there has been a good chance for the independent firms conolling this product to deal with the entire baking trade by offering is supply to them.

It has been offered in one of the markets of this country as low as cents per pound under the importer's contract price of the Chinese ozen eggs, but without buyers, as they are bound by contracts to e importers, which, of course, has to have a year to run, because ade on the yearly basis. This situation operates as a great restric)n to the trade of the domestic product. Apparently the importers e in full control of the American markets for all frozen and dried gs. With the price in the spring of 1921 at Shanghai at 8 cents per zen and the selling price in the United States of 30 cents per und the year, it would appear to be a very profitable deal for the ıporters. Since the annual selling turnover in this country of dried ıd frozen eggs is supposed to amount to at least $15,000,000, it oks like there was a big profit in these transactions for somebody.

The CHAIRMAN. Are most of the eggs used by these bakeries ıported Chinese eggs?

Mr. LEWIS. The great majority of them; yes, sir. In other words, e amount of home-produced frozen and dried eggs is very, very ıall, especially of the dried product.

The CHAIRMAN. Are all these ready-made loaves of bread which u see advertised made with Chinese eggs?

Mr. LEWIS. They are practically all made with frozen and dried gs.

The CHAIRMAN. From China?

Mr. LEWIS. Yes, sir; because that is where the great bulk of our eggs come from.

The CHAIRMAN. If that were generally known, I do not think it would promote the sale of the bread

Mr. LEWIS. Of course, I am not here to question the quality of the product which comes into this country, although I suppose we might spend quite a time discussing the question of sanitary conditions surrounding its manufacture, the sanitary condition of the goods themselves that go into the product, and the condition of this product when it reaches this country. Obviously it can not be as good as that produced in this country and is a point, of course, to be considered.

I do not know that there is any other point I especially wish to make at this time, but to bring out one important point, which I think we all ought to concede, and that is this: That for years our Federal Government has been fostering the development of our agriculture, and especially the development of poultry husbandry in this country. Hundreds of thousands of dollars have been spent by colleges and by our extension departments to build up a more efficient production, to build up a larger production, to make this country self-sustaining so far as poultry and egg supply is concerned, and I can assure you that the evidence points to the fact that the continued importation of Chinese frozen and dried eggs, whether from China or from any other foreign country, is and will continue to break down and curtail American production, because they can be brought in here and sold at a point much below what we can produce at a profit, and it would seem the height of good business to create a moderate difference, which would be the difference between the cost of production there and here, and still leave to us a living wage and a satisfactory margin of profit; and I believe in that way that you will not be increasing the cost of goods in this country to the consumer, because we have, I think, submitted evidence to show that this country can and is producing enough eggs to meet its needs, and that if the industry of breaking and drying was fostered and developed in this country we would have a good substantial business here as we formerly had.

STATEMENT OF GEORGE CUGLEY, SPRINGFIELD, OHIO, REPRESENTING BUCKEYE INCUBATOR CO. AND AMERICAN ASSOCIATION OF INCUBATOR MANUFACTURERS.

The CHAIRMAN. What business are you in, Mr. Cugley?

Mr. CUGLEY. I am vice president of the Buckeye Incubator Co. I am also associated with the Continental Sales Co., of Springfield, Ohio, which deals very largely in poultry supplies, and also with the Cugley & Mellon Co., of Philadelphia, which is a retail distributor of poultry supplies.

The CHAIRMAN. You reside in Springfield?

Mr. CUGLEY. I reside in Springfield, Ohio.

The CHAIRMAN. Will you state your views to the committee on the questions before us?

Mr. CUGLEY. Gentlemen, in presenting my argument to you I would like to have you know that I am speaking in behalf of the American manufacturers who are intensely interested in this poultry and egg tariff, namely, the incubator manufacturers, the brooder manufacturers, poultry-feed manufacturers, poultry-remedy manufacturers,

cturers, poultry supplies and equipment manufacturers, and the ultry journal publishers. It was deemed wise to have me present e case for all these different groups rather than to have them appear r themselves.

I might say initially that this group of manufacturers and others e very much concerned about this tariff on poultry and eggs. The emendous increase during the last two years in the imports of gs especially and also of poultry has already had its effect on r home industry. One of the first places that we see this is with e producer of the baby chicks. You gentlemen may not be are of the vast industry that has developed in the production of by chicks. So, I will say briefly this—that we now have in the nited States a large number of institutions that are devoted entirely the hatching and distribution of baby chickens. Our largest tchery is located at Cleveland, Ohio, with a capacity of over 000,000 eggs. We have hatcheries all over the country with pacities from 100,000 up to a half million eggs.

Senator WATSON. Take an institution of that kind, with the pacity of a million eggs, how many broods do they turn out in a ar?

Mr. CUGLEY. On an average, about three. So that the incubator pacity of a million eggs will turn out normally 2,000,000 baby chicks a season, counting on about one-third loss on the three hatches.

Senator WATSON. Is the loss that great—is that the average?

Mr. CUGLEY. It will run about a third; yes, sir—that is, the infer-le and the unhatchable will reduce the number of chicks produced bout one-third of the total number of eggs set.

I mention the baby-chick industry because that is the place where e start in the poultry industry. There has been a great deal of terest developed in this baby-chick industry in the last few years, nd it was growing at a very rapid pace.

This year when the representatives of the incubator manufacturers ent out to call on the hatcheries to solicit their business for in-eased capacity, we came into frequent contact with hatchery ners who refused to consider any increase in hatchery capacity cause of this present situation. They have been watching this tuation with regard to importation of eggs very closely and, as I y, the importation has been increasing at such a rapid rate during e last two years that they are very apprehensive with regard to e future, and repeatedly they have refused to increase their hatch-g capacity because of their fear of not having a sufficient market take care of that increase.

I might say to you that the ramifications of the poultry industry ke in a great many things besides the mere producer. When we t down at the table to consume an egg, we simply think of it as an g, and that is as far as we go; the same thing with the chicken. ut the amount of money that is invested and the volume of business at follows the poultry industry runs into very large figures. And considering the protection of the producer I think we should also onsider the protection of the industries which are connected with e producer, taking the industry all the way through; and, with a iew of bringing to your attention the volume of business that is volved and the capital that is invested, I will go through briefly he course that follows the egg to the table, and in presenting these

figures to you gentlemen I want to say that most of them have been estimated because of the brief time in which I had to compile them. I think I can say to you, however, that they are reasonably accurate and I think in every case under the actual figures as they exist.

Taking the incubator industry, which, of course, is where the industry must start, with the hatching of the egg, there are approximately 56 incubator manufacturers in the country, and those incubator manufacturers are doing an annual business of approximately $8,575,000.

Following that is the brooder industry. The brooders are necessary to raise the chickens after they are hatched. Our brooder industry in the United States is running to approximately $5,000,000 annually.

The biggest item we have in connection with the poultry industry from a commercial standpoint is the matter of poultry feeds. The figures that we have compiled show that there is approximately $500,000,000 worth of poultry feed consumed in the United States annually; a large part of that $500,000,000 worth of feed is sold by commercial poultry-feed manufacturers, and the balance of it is fed on the farm. In that connection I think it might be well to call attention to the fact that on practically every farm where poultry is kept and farming included with it there is a certain amount of grain which would be wasted if it were not for the farmers ability to feed it to the poultry. So that there is an economic condition that enters into that.

The poultry-remedy business of the United States amounts to approximately $10,000,000 a year. That includes poultry remedies and disinfectants sold to the poultry farmers.

The value of the egg-crate industry, that is, the crates which are used to transport the eggs all over the country, amounts to approximately $10,000,000 a year, and the chicken-crate industry amounts to about $6,000,000 a year.

We next come to poultry supplies, which include the galvanized feeders and water fountains and various appliances which are used in connection with the poultry farmer. That industry amounts to approximately $4,500,000 a year.

The fillers which are used in connection with the egg cases and the cardboard shipping boxes which are used for the transportation of baby chicks amount to approximately $5,000,000 a year.

The poultry-journal publishing industry—and I might say in this connection, to give you some idea of the importance of the poultry industry, that the poultry journals of this country have a circulation of approximately 1,000,000 a month. The poultry-journal business as a whole will amount to about $1,000,000 annually; and in connection with the poultry journals I might mention, in passing, that the advertising which is carried on in the farming press of the country on poultry alone in 1920 amounted to $321,000 and on poultry supplies in 1920 amounted to $675,000, or approximately $1,000,000 in advertising, covering the two phases.

Those classifications that I have mentioned to you cover the principal industries that are connected with the poultry industry and, as you can see, they run into very large figures.

I have not said anything about the value of the transportation which follows all of these industries, including the transportation of

oultry and eggs themselves. But, taking the industry as a whole, it oes represent a tremendous investment, and these various industries hich I have mentioned here have been built up after very great fort on the part of those engaged in the different branches, and we e very much concerned, as I said, because of this present situation. 'e are very certain that if those Chinese eggs, particularly, are lowed to come into this country, where each egg is going to displace a American-produced egg, it naturally must reduce the volume of isiness that is now being done by these various concerns, and I can sure you that these different branches of industry can not stand a aterial reduction in their present volume of business.

The poultry industry has not been as prosperous as it might be in i various branches, and in that one connection I might say, taking e incubator industry in itself, that out of the fifty-odd concerns at are manufacturing incubators to-day there are approximately ly five or six which are on a commercial paying basis. Some of ose that have not yet reached that point have hopes of developing eir business into prosperous institutions. But if the importation allowed to go on and these various eggs allowed to displace Amerin eggs, I very much fear that their hopes will be shattered, and at the same will follow in some of the other branches of the industry.

There has been nothing said in connection with the duty on live d dressed poultry, and I just wanted to mention, in passing, that e industries which I represent are just as much interested in the ity on live and dressed poultry as they are in the tariff on eggs, cause one is quite as important as the other, and I trust in giving is matter your consideration that you will see that an adequate riff is placed on the live and dressed poultry, because we are also pendent upon the continuation of the production of American ultry for the American consumption.

Senator CALDER. What are the exports of live and dressed poultry -day?

Mr. CUGLEY. I can not give you that. Prof. Rice is prepared to re you that information.

'ATEMENT OF PROF. JAMES E. RICE, REPRESENTING THE AMERICAN POULTRY ASSOCIATION, ITHACA, N. Y.

Prof. RICE. Mr. Chairman and members of the committee, I present the American Poultry Association, having membership in of the States and including many branches and affiliated national, gional, State, and local organizations and individual members. also represent myself, as a farmer with 177 acres and 1,400 hens. it more particularly I desire to appear here in a capacity which think is more important than either one of those mentioned in is particular event, and that is my position as a teacher and vestigator in Cornell University, in the college of agriculture, as ad of the poultry department.

When this question of tariff legislation came up the American ultry Association asked me to make a scientific study, in so far as cilities were available, of the world poultry situation as it related a protective tariff.

When we appeared before the Ways and Means Committee last ring we confessed to the committee, as you will see in the copies our testimony and the brief that we are leaving with you, that

we were not prepared to take a final position in making recommendations. But we gave the best that we had at the time. Since then we have spent a large amount of time in an effort to arrive at the truth as to the needs for a tariff on poultry and eggs and egg products, and I want you men to accept my word for it that I am more concerned as to the accuracy of the figures and facts that I am going to leave with you than I am in the welfare of the poultry industry or for my personal interest in poultry husbandry, because, first of all, we should be good Americans.

If any of our findings can be used as an argument against a protective tariff I am going to say them just the same, because what we want and what you men want is to go before the American people with a protective tariff that will stand as sound and for the best interests of the consumer, for the producer, and for all concerned.

I am going to have available for you and leave with you therefore the results of our studies, with some 350 pages of typewritten material, 58 illustrations, and in addition some 10 or 12 illustrations that have not yet been included. Some of these illustrations I would like to present to you to-day in the form of charts[1] because I find it will save your time, it will save my time, and it will be infinitely clearer. Somehow I can not make a thing clear to anyone else unless I understand it myself, and I can not understand it myself unless I graph it and get it into form that the eye can understand as well as the ear. Therefore, with your permission, I would like to have my colleagues hold up just a few of these statistical studies, to see if we can get an idea of the world poultry situation affecting the United States.

The first study, figure 1,[1] and Table I represents the importations of eggs and egg products into the United States during 19[illegible] amounting to $13,878,795, of which only $309,651 was shell eggs.

It will be clear, therefore, that the great mass of importations into this country are egg products and not eggs in shell. There is a distinct reason for that condition; the reason is that the exporters in China find, first, that by breaking the eggs they can utilize a poorer grade of eggs than they could possibly export in the shell. That is true also in this country. The cracked and poorer quality, but not bad eggs, go into the prepared product. Second, the freezing and drying of eggs reduces transportation costs; third, it reduces storage costs; fourth, the manufacturers are able to standardize their product and therefore are able to sell it with a great deal more efficiency and dispatch; and fifth, they are able to make their contracts in the spring of the year when the great proportion of the egg supply is purchased at low cost, and therefore to sell it under contract for a year in advance, as has been stated, to be delivered throughout the entire year, as wanted through their large distributing agencies in this country, because they know early in the year the approximate quantity and cost of the yearly output.

Therefore, we see that the United States is materially affected by the volume of product coming from the Orient, amounting to $6,528,598, and, I think if the truth were known, much of this prepared product imported from Europe originally came from China, because we find American capital and English capital dominating

[1] All figures referred to by Prof. Rice are on file with Senate Finance Committee.

he oriental egg trade, but now some other countries, and the Chinese, re engaged in this Chinese egg industry.

Our problem, gentlemen, is not simply to meet competition with the heap labor of China; our problem is to meet a combination between rge American capitalists syndicating the cheap labor and natural sources in China. These large corporations, although sometimes pparently under different names in the two countries, are doing usiness in China and transporting their products into America to be ld through their large distributing agencies on this side.

A few weeks ago I returned from Europe after spending a couple of onths trying to find out in the time available the poultry situation er there; and I am prepared to say that it is my judgment that we re going to see greater importations of egg products from China in e very near future than we have had in the past. In London, the eatest egg market in the world, I saw, in a single establishment wned by a man who has been in business for 40 years as an importer eggs and egg products, eggs from China, Lithuania, from Poland, om Holland, from Denmark, from Australia, from Ireland, from otland, from the Balkan States, from North Africa, and South frica, and from some others, and the dealer told me if I would stay vo or three days he would show me eggs from Argentina and from anada which were on the way. This was a fair example of my perience with other importers. The general consensus of opinion nong these men is that we may expect to see greater importations om China to the United States than we have had in the past.

In other words, as soon as the world production begins to get back normal in the European countries and eggs from cheap-land, cheap-ed, and cheap-labor countries flow into the London markets, and is trade is increasing, there is going to be a greater tendency for e products that have been going into London from China to find an tlet in America. All the world appears to have its eyes on American ld and our better living conditions.

Total value of imports of eggs (shell) and egg products, United States, 1920.

China	$6,321,526	British West Indies	$[illegible]
Hongkong	112,280	British India	[illegible]
Japan	94,792		
England	627,744	Summary:	
Scotland	38,475	Asia	6,528,[illegible]
Netherlands	15,964	Europe	821,[illegible]
Norway	130,400	North America	38[illegible]
Canada	387,422	South America	[illegible]
Argentina	8,737	Oceania	10[illegible]
Australia	104,910		
New Zealand	131	Total	7,851,[illegible]

Figure 2 and Table II show the total exports of eggs and egg products from the United States and the countries to which they were exported. The total amounts of exports to each country is shown graphically on the same mathematical scale as in the case of the imports shown in figure 1. It will be seen that our total exports were $13,878,795 in 1920 as against total imports in the same year of $7,851,523, a balance of trade of exports over imports of $6,027,2[illegible]. Of this amount our export of shell eggs was $13,569,144, and of egg products $309,651 as against our imports of egg products of $7,223,6[illegible], of shell eggs, $617,909. It is clear, therefore, as shown by the graphs and the figures that practically all or to be exact 92.11 per cent of the importations are egg products rather than shell eggs, and that practically all, namely, 97.69 per cent our exports are shell eggs and not egg products. The graphs showing imports indicate in a striking manner the fact that the Orient is our principal source of eggs and egg products of which almost the entire amount $6,321,5[illegible] is received from China, and that in addition to this $94,792 came from Japan, and $112,280 from Hongkong, which should be considered as from China, making a total of $6,528,598 or 83.25 per cent of total imports from the Orient. It will be seen that nearly one-half of the importations from Canada, namely, $159,301, or 41.12 per cent of the total were shell eggs as compared to $228,121 in egg products which, it is a safe guess, originally came from China. The total value of importations from Canada was $387,422.

It is more than likely that the $627,744 worth of eggs and egg products imported from England together with the imports of $38,4[illegible] from Scotland and those from other European countries also came originally from the Orient. When we realize that the most reliable estimates of the number of fowls in China is 400,000,000 or 100,000,[illegible] more than the United States, namely, 25 per cent more, we understand the menace of oriental competition. The importations from Australia on the other hand are largely shell eggs, these being imported during our periods of highest prices, which is the period of largest production and low prices in Australia where the spring season occurs at the same time as our fall and winter in the United States.

The export figures show that Cuba is by far our largest customer for eggs, almost exclusively shell eggs, taking $6,368,757 worth, and that Canada is next in importance, receiving $3,369,096 worth. The Canadians are large buyers, notwithstanding the fact that Canada imposes a tax of 3 cents a dozen on American shell eggs, whereas we in our mistaken benevolence permit her to enter our markets free of duty.

Figure 3 and Table III show graphically the quantity and value the imports of eggs in shell, and egg products entered for conmption in the United States, including both entries for immeate consumption; withdrawals from warehouses for consumpon; and the duties collected for the year 1920. It will be seen that e quantity of shell eggs in dozens is about equal to that of the zen or liquid egg albumen, dried whole eggs, and dried egg albuen, and that each of these is greatly exceeded by eggs frozen or herwise prepared or preserved in packages, and of frozen, liquid,

or dried egg yolk. In the case of the eggs frozen there were 9,187,355 pounds valued at $1,503,932, paying a revenue of $183,747, and there was approximately the same amount of frozen, liquid, or dried egg yolks, namely, 9,109,774 pounds, having about twice the value of the frozen whole eggs, or $3,443,048, yielding a revenue more than twice as great as the frozen eggs, of $344,304.

It is clear from these quantities and values that apparently importers find it to their advantage to break and freeze or dry practically all of the eggs and to import them as frozen eggs or as egg yolks, the two principal imported commodities, or in lesser amounts as frozen or liquid egg albumen or dried whole eggs, or dried egg albumen.

Manifestly the tariff duties, if they are to accomplish the purpose intended of protecting the producers in America, and of bringing revenue to the Government, should be placed with special reference to the quantities and values of the egg products as compared to eggs in shell.

Table III shows the amount and source of revenue produced from imported eggs and egg products for the year 1920 from which it will be seen that the total amount of revenue derived was $912,6[illegible] Just how the proposed tariff rates would affect the revenue receipts it is difficult if not impossible to accurately estimate in advance. It would seem reasonable to assume that since it is expected that the proposed rates would not act as an embargo that the increase in the rates might increase the gross income as rapidly as the smaller importations might reduce it, leaving the actual amount of revenue about the same. It would seem that the present low rates are not serving to check imports to any material extent, which would mean that the importer rather than the Government is getting the financial benefits.

Senator LA FOLLETTE. Have those charts been so reduced, Professor, that they can be incorporated in the hearings?

Prof. RICE. They have. In this thesis on the imports and exports of eggs and egg products for the United States you will see practically everything I am going to show you, and there will be additional [illegible] written matter and charts placed at your disposal, so that any members of the committee who desire more detailed information may find it available.

TABLE III.—*Imports of eggs (shell) and egg products entered for consumption [illegible] United States, including both entries for immediate consumption and withdrawals [illegible] warehouses for consumption, with quantities, values, rates, and amounts of [illegible] collected for the year 1920.*

Commodities.	Unit of quantity.	Quantity.	Value.
Eggs in shell	Dozens	1,706,701	$617,909.00
Eggs frozen or otherwise prepared or preserved in packages n. s. p. f.	Pounds	9,187,355	1,503,932.00
Eggs, yolks frozen, liquid or dried	...do	9,109,774	3,443,048.00
Egg albumen, frozen or liquid	...do	3,113,008	[illegible]2,426.00
Eggs (whole) dried	...do	2,719,276	1,351,843.00
Egg albumen, dried	...do	2,719,582	3,041,968.00
Total			10,441,126.00

Figure 4 and Table IV: The way in which importations of eggs nd egg products have increased in recent years is shown graphically in figure 4, which gives the total number of dozens of eggs : their equivalents which have been imported into the United States ich year from 1910–1920, inclusive. This shows that nearly 5,000,000 dozens of eggs or their equivalent in egg products were nported in the calendar year 1920, and that 70,000,000 dozens of ggs, complete or incomplete or equivalents were imported. In lculating egg products into their equivalents in dozens of shell eggs appears that considerable more egg albumen was imported than g yolks, which accounts for the difference between 55,000,000 ozen complete eggs and the 70,000,000 dozens of incomplete eggs.

Figure 5 and Table V show the tariff duties on eggs and egg prodcts and the amounts of exports and imports from 1855 to 1920, om which it will be seen that until the McKinley-Morrill tariff of 890 no duties were levied on eggs or egg products. In the McKinleyIorrill tariff bill occurred a duty on shell eggs of 5 cents per dozen nd on egg yolks of 25 per cent ad valorem. In the Wilson-Voorhees ill of 1894 shell eggs were reduced to 3 cents and egg yolks were duced to 20 per cent ad valorem. In the Dingley-Morrill tariff bill f 1897 shell eggs were increased to 5 cents, egg yolks were advanced 25 per cent ad valorem, and frozen albumen was given a duty of cents per pound. In the Payne-Aldrich tariff of 1909 the previous uties were continued on shell eggs, egg yolks, and frozen albumen, nd in addition dried eggs received 15 cents a pound, and dried lbumen 3 cents per pound. Under the Underwood-Simmons tariff f 1913 the duty was removed from shell eggs and was reduced on egg olks to 10 per cent ad valorem and on frozen albumen to 1 cent, and n dried whole eggs to 10 cents, the duty remaining the same as efore on dried albumen; and for the first time a duty of 2 cents was laced on frozen whole eggs. In this chart it will be seen that for he fiscal year 1920 the total imports of eggs and egg products were 9,250,021 as against exports of $18,933,978 or a balance of trade of 9,683,957.

The next six charts, figures 6 to 11, inclusive, show for each year rom 1910 to 1920, inclusive, the amounts of eggs and egg products mported, as expressed in dozens, pounds, and dollars, and also how the tariff rates and the amounts of revenue derived from these mportations.

Figure 6 shows the imports of eggs in shell bearing a duty of 5 ents per dozen in 1910 to 1913, inclusive, but entered free of duty rom 1914 to 1920, from which it will be seen that by far the largest mportations occurred in 1914 and 1915 of 6,500,907 dozens and 1,058,863 dozens, respectively, and that during the fiscal year 1920 he amount was 1,708,701 dozens. The amount of tariff duty derived n 1913, the last year when a 5-cent duty was levied, was $63,588.

Figure 7 shows the imports of eggs frozen or otherwise prepared r preserved in packages, bearing no duty from 1910 to 1913, inclusive, and 2 cents a pound from 1914 to 1920, inclusive. In the latter year the revenue amounted to $183,747. It will be seen that no importations occurred of frozen whole eggs until 1914 and that the amount ordinarily was in the neighborhood of 2,500,000 pounds for

the years 1914, 1915, 1916, and 1917, but increased to the amount of 9,187,355 pounds in 1920.

Figure 8 shows graphically the imports of frozen or liquid egg albumen which first occurred in 1914 bearing 1 cent per pound duty and increased quite consistently until 1920 when the amount was 3,113,008 pounds valued at $582,426, paying a revenue of $31,1[illegible] for that year.

Figure 9 shows the imports of frozen, liquid, and dried egg yolks bearing a duty of 25 per cent ad valorem from 1910 to 1913, inclusive, and 10 per cent ad valorem from 1914 to 1920, inclusive. The importations were negligible until 1915, from which time they increased rapidly and consistently almost without exception until 1920, when they reached 9,109,774 pounds valued at 3,443,048 and paying a revenue of $344,304.

Figure 10 shows the imports of dried whole eggs which from 1910 to 1913 carried a duty of 15 cents per pound and from 1914 to 1920 of 10 cents a pound. The importations were negligible until 19[illegible] when they were 1,590,563 pounds, amounting to $417,417 and increased steadily until 1920, when they were 2,719,276 pounds amounting to $1,251,843 and paying a revenue of $271,927.

Figure 11 shows the imports of dried egg albumen bearing duty of 3 cents per pound from 1910 to 1920, inclusive. The importations increased very consistently from 699,612 pounds in 19[illegible] to 4,060,360 pounds in 1919 valued at $4,148,522. This amount decreased in 1920 to 2,719,582 pounds valued at $3,041,968, the revenue in 1920 being $81,587.

The total amount of revenue derived each year and for 11 years from 1910 to 1920, inclusive, for eggs and egg products is shown in Table XII. (See p. 2888.)

It is certain that a more equable arrangement of tariff rates would have produced a larger revenue.

The tariff duties which we recommend based on the quantity and money value of the egg products with respect to shell eggs, to be explained later, will, we believe, remedy the defect.

TABLE IV.—*The equivalents in dozens of the imports of eggs (shell) and egg products entered for consumption in the United States, including both entries for immediate consumption and withdrawals from warehouse for consumption during the fiscal years 1910–1920, transposed into their equivalent of eggs in dozens.*

[The total quantity of complete and incomplete eggs in shell is determined by taking the total quantity of imports of eggs (shell) and egg products entered for consumption in the United States, including both entries for immediate consumption and withdrawals from warehouse for consumption and transposing them into their equivalent of eggs (shell) in dozens by means of "The factors used in transposing egg products into their equivalent of eggs (shell) in dozens."]

Perhaps the most important fact that we might set before [...] which might be of assistance in helping us to arrive at a [...] conclusion as to the amount of duty which should be levied

estimate of the cost to produce a dozen eggs in the United States. e have been diligent in trying to arrive at those facts. The best at I can give you at the present time is shown here in the chart, ure 12 [exhibiting chart to the committee].

Every one of the records from New York State are based on a ate college supervised record. These are not individual reports of iat a farmer gives as an opinion or as a guess, but they are based on personally conducted cost-account records, where college exision specialists have visited the farms regularly to supervise the ords.

In undertaking to establish tariff rates based on the difference in cost of production between countries from which imports are eived and in the United States, it is necessary to establish a sound sis for determining the cost of production of a dozen eggs on an erage throughout the year, and for a period of years in the United ates, and what that cost is under normal average conditions.

Figure 12 and Table XIII show the actual cost to produce a zen eggs in the United States during the years of 1914 to 1920, lusive, on 149 farms, representing 105,481 hens. The figures are m actual cost-account records and surveys on farms, principally the States of New York and New Jersey, and including also a farm Kentucky and one in Indiana. Estimates on the cost of egg protion in California and Washington confirm the figures here quoted m the Eastern States, which leads us to believe that the cost of production on the west and east coasts of the United States, luding the cost of marketing, are essentially similar, some of the t account factors being greater in the East and others greater in West. Ths cost in the Middle West and the South probably are ttle cheaper than either the far West or extreme East, on account proximity to cheaper grain and general farm range conditions.

From figure 12 it will be seen that in 1914 it cost $0.317 per dozen New York, and it cost $0.29 for 1915 in New York, and in subsent years the costs were:

Jersey, 1915	$0.293
York:	
1916	.308
1917	.497
1918	.402
1919	.476
1920	.482
tucky, 1920	.411
iana, 1920	.373

t is interesting to observe that the 100 cost-account records and veys representing 79,847 hens in New Jersey gave a cost of $0.293 dozen and in the same year three farms having 3,825 hens in York gave a cost of $0.29 per dozen, showing that data taken impartial observers, and neither aware of the methods employed the other, arrived at essentially the same cost to produce a dozen s in New York as in New Jersey.

From estimates of the costs of egg production in years preceding war which is 25 to 30 cents per dozen, it is reasonable to assume t within a few years the cost to produce a dozen eggs will approach probably will not fall quite as low as the prewar cost. If, theree, we should assume an average cost of 27 to 28 cents per dozen the United States as a whole, we probably would not be far from truth. If we should accept this as out cost basis on which to

place a tariff duty on shell eggs which would serve to equalize the difference between the cost of production here, and in competi countries having lower cost of production, such as the Orient, Au tralia and Argentina, a duty of 8 or even 10 cents per dozen probab would permit eggs costing 15 to 18 cents per dozen, laid down America to be imported. Since it is known that shell eggs are so in America at 15 to 18 cents per dozen with apparent profit to th packers and importers the adding of 8 cents per dozen duty to the c of the imported products would make the total cost 23 to 26 cen per dozen for shell eggs and probably would not result as an emba and stop the importation.

TABLE XIII.—*Cost to produce a dozen eggs (149 farms and 105,481 hens) in United S 1914–1920.*

	1914	1915	1915	1916	1917	1918	1919	1920	[illegible]
Average cost per year to produce a do en eggs	$0.317	$0.290	$0.293	$0.308	$0.497	$0.402	$0.476	$0.482	$0.411
Number of fowls	1,549	3,825	79,847.5	3,366	4,074	6,865	2,211	3,469.5	[illegible]
Number of farms	1	3	100	6	6	15	6	10	1
Authority	C.U.D. F.M.	C.U.D. F.M.	N.J.A. Col.	C.U.D. F.M.	C.U.D. F.M.	C.U.D. F.M. C.U.D. P.H.	C.U.D. F.M.	C.U.D. F.M. C.U.D. P.H.	Ky.A. Col.
State	N.Y.	N.Y.	N.J.	N.Y.	N.Y.	N.Y.	N.Y.	N.Y.	Ky.

Figure 13 and Table XIV show the distribution of cost fac in egg production expressed in the terms of the per cent of e factor to the total cost. These figures are taken from caref kept cost-account records on a large poultry farm in New Y State where 2,000 or more birds are kept. They are for the ye 1914–15 in comparison with the years 1917–18 and 1920–21. Fr these three records it will be seen that the percentage of the costs feed and the total cost of egg production was 58.2, 64.2, and per cent, respectively, averaging 59.5 per cent; and that labor was 17.2, 13.9, and 18.1 per cent, respectively, averaging 16.4 cent. The depreciation of stock over and above the cost of rear for replacement was 13.3, 13.2, and 14.5 per cent, respectively, av aging 13.7 per cent; and the costs due to taxes, insurance, rep and interest were 7.2, 6.2, and 7.8 per cent, respectively, averag 7 per cent for each of the three years, respectively. The small ance of the cost remaining was for marketing, litter, and for mi cellaneous expenses. The two principal factors in the cost of duction, namely, feed and labor, are the two items in particular w are cheapest in our principal competing countries. It is to equal these two particular cost-account factors between the United St and competing countries that the tariff rates which we recomm have been determined.

Senator WATSON. That is all very interesting as showing the of production here. Can you show the cost of production abroad

Prof. RICE. I have been unable to do so. I am in personal cor spondence with two or three friends in China, who are teachers missionaries there, and Government service men, and none of t can give me anything like actual cost-account records. Chickens China are almost all in small flocks, of only 10 to 15 or 25 bir They are smaller flocks by a good deal than the average in this coun

d most of the eggs produced are sold, because they are a cash-oducing commodity, and they use their money to pay taxes and purchase rice and other cheaper food to eat.

The question of importance of dressed poultry importation is ite as serious in its way as the egg and egg-product importation. iave positive information that some of the big capitalists in this intry are building modern establishments for crate fattening ckens in China, as we have in the United States. They have ed as good an expert as can be found in the United States. He s been there for several years to develop that business.

We also have information that American capitalists are equally icerned in and are hunting for people to go to Argentina, for the son that they find it more profitable to use their American capital buy, and fatten, cheap Chinese and Argentine chickens with eap oriental and South American feed, and to buy and freeze d dry eggs and ship them into this country, than they do to employ nerican labor to produce those things in the United States.

TABLE XIV.—*Cost factors in egg production.*

[Expressed in terms of per cent of each factor to total cost.]

	1914–15	1917–18	1920–21	Average.

We want to come close to home and see what the poultry situation in the United States. Instead of using, as I could have done, the ap showing the total amount of eggs produced and consumed in e United States, by States, I thought it would be more instructive show the States that have an excess production, and the States at have an excess consumption, and the amounts.

Senator WATSON. When you subtract one from the other what do u get?

Prof. RICE. We show only the excess. This map, figure 14, shows ly the quantity after the total production of each State has been btracted from the total consumption to get the excess consumed, after the total consumption is subtracted from the total production get the excess production as the case may be.

We have seen that the United States produces more eggs than are nsumed. It is important to know which States are producing ore eggs or less eggs than they eat, and why. For this purpose ure 14 and Table XV have been prepared, showing graphically e excess production over consumption or excess consumption over oduction in various States. It will be seen from this study that e States of Wisconsin, Iowa, Illinois, Indiana, Missouri, Kansas, ebraska, South Dakota, North Dakota, Minnesota, Oklahoma, ennessee, Arkansas, Kentucky, Ohio, Montana, Idaho, Delaware, irginia, Wyoming, and the three Pacific Coast States, Washington,

Oregon, and California, produce more eggs than they consume. The great proportion of excess production is in the Middle West grain-growing section. Whereas, all of the New England States, and the Middle and South Atlantic States with the exception of Virginia and Delaware, of the East South Central States Alabama and Mississippi, and of the West South Central States Louisiana and Texas, of the mountain States Colorado, New Mexico, Arizona, Utah and Nevada, and Michigan among the North Central States consume more eggs than they produce. The excess consumption of the New England and the Middle Atlantic States is due primarily to the large population in the great industrial centers in proportion to the amount of productive farm land, whereas the excess consumption in the Southern States is due to the lack of diversified farming on account of specialization in cotton or some other farm crops.

Whatever the causes may be for failure to produce enough eggs to meet the needs of the State, it is clear to persons familiar with farming conditions that they are sufficiently well adapted to the efficient production of poultry and eggs to fully or more nearly meet the needs of these sections, provided the equitable tariff rates representing the difference in the cost of production in the United States and the Orient were to be placed on the importation of eggs and egg products.

If any State because of climatic or farm conditions can not produce eggs and poultry economically, other States more fortunately situated in this particular respect can be counted upon to supply the demand without importing poultry products from any country at any time. We can produce these products and deliver them as economically as any other country except for the factor of labor as applied directly to poultry or indirectly to the growing of the feed or manufacture of accessories or transporting and marketing of the products, all of which involve the employment of labor in our own country, which is entitled to receive the same protection as poultry men. The tariff rates which we urge are intended to represent the differences in labor costs of all the factors that enter into the production of poultry and of eggs and egg products, and placing them on the markets in America as compared to a similar or inferior quality imported from competing countries.

The figures showing estimates of consumption and production are based on our own calculations from figures of population and dozens of eggs produced as shown by the last census in 1919, and assume the same average consumption per capita of eggs in each State according to the average of 15.41 dozens of eggs per capita consumption for the United States, or 181 eggs per capita, which is approximately one-half egg per person per day.

Some of the more striking results in excess production over consumption are: Iowa, 83,434,993 dozens; Missouri, 64,440,716; Kansas, 48,713,133; Indiana, 37,680,248; whereas New York has an excess consumption of 98,795,857 dozens; New Jersey, 35,636,[illegible]; Massachusetts, 50,107,244; and Pennsylvania, 59,162,092.

Senator CALDER. Do I understand from this map that Kansas produces 48,000,000 dozens more eggs than she consumes?

Prof. RICE. Yes; Kansas produces 48,713,133 dozens more eggs than she consumes according to our own calculation, using United States Government figures of population and dozens of eggs produced.

Senator CALDER. And New York consumes 98,000,000 more than e produces?

Prof. RICE. Yes; to be exact, 98,795,857 dozens.

The CHAIRMAN. What are the figures for Pennsylvania?

Prof. RICE. Pennsylvania consumes 59,162,092 dozens eggs more in Pennsylvania produces, and yet Pennsylvania is the sixth in ik as an egg-producing State, exceeded only by Iowa, 120,697,319 tens; Missouri, 117,203,569 dozens; Illinois, 105,757,907 dozens; io, 102,377,143 dozens; and Kansas, 76,136,616 dozens of eggs in 19.

Senator SMOOT. Professor, did I understand you to say that we did produce enough eggs in the United States to feed the people of United States?

Prof. RICE. We are producing an excess; that is to say, the im-tations into this country are not so great as the exportations, and ports mean surplus.

Senator SMOOT. The importations are about one-seventh of 1 per it. Our exports are nine times as great as our importations.

Prof. RICE. My figures would not show it as great as that.

Senator SMOOT. I have got the figures here. I will take it first, if u want to, for the first nine months of this year. We exported 195,247 dozen eggs, valued at $6,735,772; we imported during the ne period but 2,707,923 dozen eggs, at a valuation of $794,352.

Senator MCCUMBER. It is admitted we produce more than we con-ne in the United States.

Prof. RICE. I think possibly the place where we differ is this: That se you are quoting perhaps allude strictly to shell eggs; the figures ave in mind are the entire quantity and value of the egg products d shell eggs combined.

Senator SMOOT. That does not make a particle of difference. If u want me to, I will quote those to you. So it makes no difference her way you go.

Senator WATSON. I understand, then, your contention to be that n though we have an excess production over consumption, and n though we export more than we import, throwing a small ount at a lower price on a glutted market would have a tendency decrease the price of the whole.

Prof. RICE. There is no doubt about it, and certainly we can not away from the fact that when those millions of dollars' worth of se cheap Chinese products are dropped into this country under se circumstances they tend to reduce the price and displace the ne amount of the American product. If our markets are already l they have to overflow somewhere and are exported.

We believe that the way to settle this question is to put an effective iff duty—our people have said 8 cents; I think that it ought to be her. We believe that 8 cents or even 10 cents will still allow eggs come in and will safeguard our consumers against monopoly. The ly monopoly is where somebody buys or makes and holds products sufficient quantity to manipulate the markets. The farmers can t do that with eggs and poultry, as they are the ones who do the oducing. There are too many of them and their products are too iversally produced to be controlled by the growers. We believe at there will be a tendency for a little higher price for a season or so th an equitable tariff on poultry and poultry products and will

produce enough more profit for a little while to stimulate other peopl[e] in America to produce more eggs and poultry, because the chicke[n] business is sensitive to economic changes, as I shall show later. I[t] will stimulate poultrymen in Massachusetts or Mississippi, for examp[le] to fill up their empty henhouses, or to put up another henhouse, or w[ill] induce others to go into the chicken-raising business who will prod[uce] eggs in this country at a price that will be just as fair in the end t[o] the consumer as it would be if we had allowed our henhouses to [lie] idle while a certain proportion of our eggs and egg products w[ere] being produced in Arentina and China.

TABLE XV.—*Excess production or consumption of eggs by States, 1919.*

[Per capita consumption of eggs in the United States in 1919 was 15.41 dozens, or 186 eggs, appro[x] one-half egg per person per day. Estimated State consumption is average per capita consu[mption] multiplied by State population. Difference between estimated consumption and actual, or consum[ption] data, from 1920 census of Population and Agriculture.]

Our argument is that we believe with proper duty those things can : produced here as economically as our standards of living will stify.

One of the features that I hope I can make clear is that the poultry dustry, more than any other branch of agriculture, is sensitive to onomic conditions. The poultry industry can go in or go out in ro years' time to such an extent that it will materially change pro- iction and values in this country.

Senator WATSON. You say the economic conditions are responsible r those fluctuations. To what extent did imports influence those?

Prof. RICE. I am very glad you asked the question, because as we id that the psychology of the situation has a very important effect— at is to say, when we learn of shiploads or large cargoes of the shell gs or frozen eggs or dried eggs coming into the market—it will imme- ately affect the sale of those commodities in the large markets, and would expect to see a drop in the market prices. I have frequently me into the large markets and have seen those Chinese eggs and -products sold, and have heard the merchants arguing for a lower ice on eggs because of the competition with the lower priced foreign oducts. Contracts are made and shipments arriving on falling arkets tend to further depress them.

The word "dumping," as you understand it, might not apply, but comes pretty close to it. They are dumping onto the American arkets large quantities of Chinese eggs and egg products, as we can ow, in the spring of the year on a falling market, and that has a ndency to lower the price of eggs throughout the entire United ates because local prices are governed by market quotations in large ies.

This works to the advantage of the men engaged in cold storage, ving taken advantage of their ability to influence the market if ey wanted to.

I think, my friends, one of the best things that we can do is to make impossible for that thing to take place, to manipulate the market.

Senator LA FOLLETTE. Have they not the power to manipulate at market regardless of the importation?

Prof. RICE. Yes, sir; I think so, and more than that, perhaps you e already familiar with the fact—if you are not you can verify y statement—eggs are gambled in the New York and Chicago te wheat, sold on futures and sold over and over again, and some- dy has to pay the bill.

Senator LA FOLLETTE. With what result on the price?

Prof. RICE. Of course, the tendency will be to widen the spread tween the price received by the producer and the consumer. his will lessen consumption and eventually the shock will fall upon e one at the bottom, the man on the land When you lower the ice received by the producer, you decrease the number of eggs in cubators and thus decrease the next years' production of eggs and e consumer suffers.

What I want to make clear, gentlemen, is this: That if it is true, we maintain, first, that America has the soil and the climate, e educated farmers and the conditions to produce eggs and chickens onomically, to sell to our own people. Whenever you allow eggs come in to this country at those lower prices it displaces just that nount of the American product and the American producer will go

out or go in to the poultry business according to the law of supply and demand. It is conspicuously true that there are many empty henhouses and houses not filled to capacity because the poultry industry has not yet come back since the decline during the war. In many States they are not producing as many eggs as they did 1[?] years ago.

Figures 15 to 24 and Table XVI: Until one carefully considers item by item the value of the products produced in the United States, he does not fully realize the great importance of the poultry industry. By comparing the value of the eggs produced and chickens reared annually in the various States with the value of some of the other principal agricultural products he is surprised to find that what appears to be small as a single farm unit becomes of great size in the aggregate for each State and for the United States. This is because poultry is so universally kept on farms. Farms reporting poultry kept far exceed those of any other kind of live stock, except horses and mules, the last census showing that 89 per cent of farms reported chickens.

The statistics which we have prepared deal exclusively with the production of eggs and chickens of the domestic fowl on farms and does not include the production of any other kind of poultry, such as turkeys, ducks, geese, pigeons, and the like, which, if included would have increased the figures about 6.4 per cent, and does not include the vast number of chickens reared and eggs produced in villages and in cities. Since the Government statistics include only poultry kept on farms of 3 acres or more,[1] this alone would greatly increase the value of the products to be credited to the poultry industry. Notwithstanding these omissions the figures will, I am sure, surprise nearly every one who has not given the subject careful thought. They show that not only are more persons directly engaged in the keeping of poultry than in any other kind of live-stock production or other single agricultural crop, but that the production's annual value greatly exceeds that of many of the agricultural products which we have been accustomed to give major consideration in the matter of legislation or research and education. In order that the figures may be more understandable, graphs have been made of two or more States in each of the geographical sections as defined by the Bureau of the Census of the United States to show the value of eggs produced and chickens reared, dairy products, wool, fruits, wheat, oats, corn, potatoes (white and sweet). It is to be regretted that statistical data is not yet available for all of the States, some of the more important of which we would like to have included in the presentation.

New England States: In the geographical regions in the regular order, published by the Government, we find that the three New England States, for example, Massachusetts shows a value for eggs produced and chickens reared of $9,004,007; Connecticut, $5,876,[?]; and New Hampshire, $4,341,810. These figures exceeded in value the wool, the wheat, the oats, the corn, and the potatoes, respectively, and in the case of Connecticut and New Hampshire exceeded [?]

[1] The enumerator must not report as a "farm" any tract of land less than 3 acres, unless there were produced on such tract products to the value of $250 or more, or unless it required the continuous services of at least one person. (Instructions to census takers, 1919.)

ılue of all of the fruits and, for products compared, was exceeded ıly by the value of the dairy products.

Middle Atlantic States: In the case of New York the value of the ;gs produced and the chickens reared was $42,841,499, which exeded by far the wheat, which was $20,556,621, or the oats, which as $21,595,461, or the corn, $24,691,113, and the wool, $1,976,986. ıe value of the chickens reared and the eggs produced nearly ıualed all of the fruits, which were valued at $51,519,503. In New rsey the value of the total of eggs produced and the chickens reared ıs $12,200,716 and exceeded the wheat, which was $3,087,324, oats .403,453, wool $32,020, and all fruits $11,809,078.

East North Central States: In the great diversified agricultural States Ohio, Indiana, Wisconsin, Michigan, and Illinois we find a large delopment of the poultry industry. In the case of Ohio, the value the chickens reared and eggs produced, which was $64,109,133, far ceeded the value of wool, which was $10,074,579; of all fruits 5,172,769, oats $39,795,590, and potatoes $18,186,036, but was s than the dairy products, which included milk, cream, and butter t sold and butter and cheese made, $81,148,586, whereas in diana the value of eggs produced and chickens reared was $52,765,-0, which exceeded the value of the dairy products, which was 4,072,646, all of the fruits, $4,842,535, and wool, $21,319,545. The ılue of the eggs produced and chickens reared in Wisconsin was 0,288,326, which exceeded in value the wool, which was $1,691,728; fruits, which was $5,043,189, and wheat $16,489,016. In Illinois ickens reared and eggs produced was $67,690,085, and exceeded in ılue the wool, which was $2,217,103; all fruits, which was $14,572,750, ıd was nearly equal to the dairy products, which had a value of 1,998,333.

West North Central States: The study of the value of the eggs proıced and chickens reared in 1919 in the great grain-growing and ock-producing section of the Middle West, shows the great imporınce of the domestic fowl in the production of human food. For exıple in Iowa eggs produced and chickens reared were valued at 0,212,544, which exceeded the value of the dairy products, which ıs $55,408,744, and vastly exceeded the value of the wool, which was ,762,486; of all fruits, which was $7,056,389; and the wheat, 4,479,372. In Minnesota the value of the eggs produced and ickens reared was $33,438,496, which exceeded the wool, which was ,557,736; of all fruits, $3,145,513. North Dakota showed a value eggs produced and chickens reared, which was $16,486,386; nearly ıual to the value of the dairy products, which was $19,576,343; and ceeded the wool, which was $913,176; of all fruits, which was 4,880; and corn, $5,427,636; and white potatoes, which was 0,142,747. Kansas had a value of eggs produced and chickens ared annually of $44,199,844, whereas the dairy products were ılued at $34,920,619; wool, $1,017,405; all fruits, $6,349,662; potaes, $8,005,316; and oats, $29,005,885.

Missouri, next to Iowa in value of eggs produced and chickens ared, was $66,271,029, which exceeded in value the dairy products, hich was $34,752,845; wool, $4,161,236; and all fruits, $18,454,698.

South Atlantic States: Take for example North Carolina: The ılue of eggs produced and chickens reared was $20,406,603; Georgia,

$26,218,622; Virginia, $25,137,968, which exceeded the value in each State of the dairy products, which was, for North Carolina, $14,912-137; for Georgia, $16,757,195; for Virginia, $19,167,935. And for all fruits for North Carolina, $6,554,397; for Georgia, $10,935,703; for Virginia, $17,770,660.

East South Central States: It will be seen by comparing the value of the eggs produced and chickens reared in Kentucky, $26,210,[illegible]; Tennessee, $29,065,336; and Mississippi, $15,132,499; that in each instance they exceeded in value the dairy products which were Kentucky, $22,487,710; Tennessee, $20,640,849; Mississippi, $11,772,201; and also exceeded in these States the value of the wool and all fruits, the wheat, and the oats, respectively.

West South Central States: The value of eggs produced and chickens reared in Oklahoma was $28,634,007; Arkansas, $16,245,1[illegible]; Louisiana, $8,835,402; and also these products exceeded in each instance the value of the wool; and in Louisiana and Oklahoma exceeded all fruits; in Arkansas and Louisiana exceeded wheat and the oats.

Mountain States: The value of the chickens reared and eggs produced in Colorado, $8,773,648, exceeded in value wool, which was $4,877,656; and all fruits, $8,757,678; and oats, $4,308,752. In Idaho chickens reared and eggs produced were valued at $5,673,217 and exceeded the value of the oats and corn combined. In Utah chickens reared and eggs produced had a value of $2,887,510 and exceeded in value the oats and the corn combined.

Pacific States: In the case of the three Pacific Coast States, the value of eggs produced and chickens reared in 1919 was for Washington, $13,779,958; for Oregon, $9,018,444; for California, $40,341,744. In the State of Washington the value of eggs produced and chickens reared exceeded the value of the wool, which was $2,254,025; the potatoes, $12,320,093, and the corn and oats combined. In Oregon the value of the chickens reared and eggs produced exceeded the value of the wool, which was $8,019,524; the potatoes, $7,433,878, and the corn and oats combined. In California the eggs produced and chickens reared was higher than the value of the wool, which was $6,695,461; the wheat, $36,938,477; the corn, $5,862,3[illegible]; the potatoes, $20,896,048; and more than four-fifths the value of the dairy products, which were $55,642,629.

From this brief consideration of the value of the chickens reared and eggs produced in comparison with some of the principal products which they closely approached or exceeded in value, one can not escape the conclusion that the poultry industry, because of its size as well as the importance of the products which it contributes to the nourishment and health of the Nation, is entitled to the same consideration in the framing of a tariff law that is given to other agricultural or industrial products.

TABLE XVI.—*Value of some agricultural products produced in 1919.*

ata: Fourteenth Census of the United States, 1920—Agriculture. Prepared by poultry department. New York State College of Agriculture, Cornell University, Ithaca, N. Y.]

Potatoes (Irish or white)	12,320,093	7,433,878	20,896,048

Figure 25 and Table XVII: It is a significant fact, which we should take seriously into consideration, that the population of the United States is increasing more rapidly than is egg production. The statistics of human population, as shown by the last census in 1919, was 105,710,620, and in 1909 it was 91,972,226, an increase of 13,738,354, which is 14.9 per cent increase. In 1919 the eggs produced was 1,656,267,200 dozen, as compared to 1,574,979,416 dozen eggs for 1909, or an increase of 81,287,784 dozen eggs, or 5.14 per cent increase during the 10-year period.

Not only has our population increased more rapidly than has egg production, but other statistical studies which we have made show that consumption of eggs per capita has materially decreased during the 10 years between the Thirteenth and Fourteenth Census periods. Our estimates from the Thirteenth Census figures, 1909, was an average consumption of 17.31 dozen eggs per capita. In the Fourteenth Census it was 15.41 dozen eggs per capita, a decrease of 1.9 dozen, or 21 eggs per capita. For the United States this would mean a reduction of 200,850,178 dozen eggs consumed, or 10.9 per cent. This reduction in the number of eggs consumed would be nearly equal to the combined egg production in 1919 of the States of Ohio and Illinois.

The inevitable conclusion from these two facts is that the United States, with all of its natural advantages for efficient production of poultry and eggs, is finding it more profitable to produce other products or to engage in other occupations. Otherwise our production would increase with our population, because there is an abundance of land, building materials, equipment, labor, and other factors for the successful and economical production of eggs.

The comparatively small increase in eggs produced and lower egg consumption per capita is undoubtedly due to the unfavorable conditions for the development of the poultry industry, largely as a result of the World War. Taking into consideration the United States as a whole, particularly in those sections very far remote from the large grain growing areas, the poultry industry suffered a serious decline during the war. Figure 30 shows in two parallel columns graphically the number of dozen eggs produced in 1909 as compared to 1919 for each State. Those on the left are the States showing increases in dozen eggs produced during the 10-year period, while those on the right show a decrease in dozen eggs produced.

These show conspicuously that all of the New England Stat- Maine, New Hampshire, Vermont, Massachusetts, Rhode Island. and Connecticut, and the Middle Atlantic States, New York and New Jersey, with the exception of Pennsylvania, were producing less eg- when the census was taken in 1919 than they were 10 years befor- The other States showing a decrease were: Michigan, Kansas, Dela- ware, Maryland, District of Columbia, Kentucky, Louisiana, and Texas. In Kansas, for example, there was a decrease from 81,987,- to 76,136,616, or 4,951,073 dozens, or 6.49 per cent, while there wa- an increase in population from 1,690,949 to 1,769,257, or 78,30- 4.63 per cent. In Texas there was a decrease in egg production fr- 77,377,977 dozen to 70,625,008 dozen or 6,752,869 dozen, or 9.- per cent. During the same length of time there was an increa- population from 3,896,542 to 4,663,228, or 766,686, or 19.21 per ce-

It will readily be seen that the conspicuous increases in producti- occurred in the large grain-growing sections in the Middle West and including the North Central States and also the Pacific Coast Stat- Iowa shows an increase in egg production of from 108,662,88- to 120,697,319, or 12,034,437 dozen, or 11.08 per cent, while the popula- tion increased from 2,224,771 to 2,404,021, or 179,250, or 8.10 pe- cent. California showed the largest increase in the production fro- 40,735,238 dozen to 64,123,885 dozen, or 24,388,647 dozen, or 59.- per cent, while the human population increased from 2,377,54- to 3,426,861, or 1,059,312, or 44.13 per cent.

Pennsylvania is a conspicuous example of a State that made a s- sational increase in human population and only a very slight incre- in the dozens of eggs produced, namely, an increase in populati- from 7,665,111 to 8,720,017, or 1,054,906, or 13.76 per cent, and a- increase in production from 73,683,489 dozen to 75,998,172 doz- or 2,314,683 dozen, or 3.14 per cent. As examples of States th- showed a large increase in population and a material decrease in eg- production are New York, Massachusetts, Connecticut, New Jers- Michigan, and Texas. For example, in New York there was a- increase in human population of from 9,113,614 to 10,385,227 - 1,271,613, or 11.39 per cent, and the reduction in the dozens of eg- produced, 71,191,449 to 62,175,162, or 9,016,287 dozen, or 1- per cent. Estimates that we are able to make of the decrea- poultry population on account of war conditions show an estima- decrease of one-third to one-half of the total poultry populatio- some of the New England and Middle Atlantic States. Thus it w- be seen that in these States the poultry population before the w- has not been fully restored.

Are we not under national obligation to enact such tariff legis- tion as may be necessary to make it easier for our own people in a- of the States to return to normal conditions, and to make su- profits as will enable them to produce eggs and poultry to sell dire- from the American farms to American consumers?

ABLE XVII.—*Population and egg production of United States, 1919–1909—States showing increase and decrease.*

[1] ... showing decrease in dozens of eggs produced in 1919.

gures 26, 27, and 28 and Table XVIII: Tariff rates should be d on the quantity and value that each egg product bears to eggs. The method which we have used in attempting to e at equitable rates on egg products is shown in figures 26, 27, 28, which show the estimated amounts of various egg products derived from shell eggs and the comparative values of the vari- egg products, assuming shell eggs to be worth 20 cents per dozen the products to be worth the prices indicated in the spring of

the year, the prices being the actual quotations furnished by larg importing firms, as shown in the tables. For example, it is shown in figures 26, 27, and 28, assuming that a dozen eggs in the shel weigh on an average 1½ pounds, then the frozen or liquid whole eg removed from the shell would weigh 1.16 pounds, and the frozen or liquid egg yolk would weigh 0.56 pound, while the frozen or liquid eg albumen would weigh 0.6 pound, or the two taken together would be the same as the frozen or liquid whole egg. The whole dried egg would weigh 0.32 pound, which would be the amount of the contents of the egg less the moisture which had been removed in the drying proce The dried egg yolk would weigh 0.25 pound and the dried egg albu men 0.17 pound, the larger proportion of moisture being retained i the dried egg yolk which is found necessary in the preparation compared to the greater evaporation of the dried egg albumen this chart is shown also the number of shell eggs, expressed in fra tions of a dozen, required to produce 1 pound of the egg produ For example, taking the same average weight for shell eggs as in cated above, as 1½ pounds, it would require, in order to produce pound of shell eggs, 0.666 of a dozen; for 1 pound of frozen or liq whole egg it would require 0.86 of a dozen; for frozen or liquid yolk it would require 1.8 dozens; for frozen or liquid egg albumen would take 1.66 dozens; for 1 pound of dried whole egg it would quire 3.16 dozens; for dried egg yolk it would take 4 dozens; and 1 pound of dried egg albumen there would be required 5.83 doze These figures and graphs show that if equitable tariff rates are to arrived at the rates to be decided upon should be in proportion the quantity and value of each of the commodities based on the va of shell eggs during the months when the largest number are pu chased for freezing and drying. Otherwise the importer would able to ship his products into this country in the particular fo either as whole eggs or egg yolks or egg albumen in the frozen dried forms, depending upon which commodity required the paym of the lowest duty in proportion to the value of the product. Jugg the preparation of egg products in order to avoid paying tariff du has been resorted to successfully in the past and should be prevent in the future. This can best be accomplished by making the rates fit the quantities and values which the products bear to quantity and cost of shell eggs and other actual costs which into the manufactured products.

Figure 27 gives the wholesale market price per pound and dozen of shell eggs and equivalent in egg products, using the ac wholesale market prices quoted for March, April, and May by porters, this being the season when the great bulk of eggs is pu chased in the Orient, to be frozen or dried for export at which t the products are sold under contract for a year in advance to delivered as wanted. Obviously the prices at this season of the ye would be more nearly correct, although not exact, as a means of es mating values for a year than it would be to take the average each month in the year or for a market price at any particular sea Not being able to estimate accurately the average cost to break freeze or dry the numerous egg products, we have used the sell price as representing the comparative values of egg products.

[t will be seen from the table that assuming eggs in shell to be rth 20 cents per dozen, then a pound of shell eggs will be worth 166; frozen whole eggs, $0.245 per pound; frozen or liquid egg ks, $0.26 per pound; frozen or liquid egg albumen, $0.245 per ınd; dried whole eggs $0.75 per pound; dried egg yolks, $0.60 per ınd; dried egg albumen, $1.50 per pound, not including the cost manufacturing. When expressed in the wholesale price per dozen eggs in shell and for egg products in the United States in April, !1, as follows: The value of each product derived from a dozen s weighing 1.5 pounds would be, for eggs in shell, 20 cents per ;en; frozen or liquid whole eggs, $0.2842 per pound; frozen or iid egg yolks, $0.1456 per pound; frozen or liquid egg albumen, 1470 per pound; dried whole eggs, $0.2400 per pound; dried egg ks, $0.1500 per pound; dried egg albumen, $0.2550 per pound. se figures are based on the proportionate values as per wholesale es quoted above for each of the egg products that would be duced from a dozen of shell eggs weighing 1.50 pounds.

n figure 28 is shown a comparison of the proposed tariff rates on s and egg products, which are based on the weight of United States s weighing 1.5 pounds to the dozen, and the wholesale price in the ited States of imported eggs in comparison with the rates in the dney bill and the recommended increase in rates for the Senate . From these estimates it will be seen that in the case of frozen iquid whole eggs the rates based on the actual quantity and value this egg product, assuming shell eggs at 6 cents per dozen, the iff duty should be $0.073 per pound instead of 4 cents, as in the dney bill; and if the rate on the frozen or liquid whole eggs were be based on the actual quantity and value of this egg product, ıming shell eggs at 8 cents, then the frozen product rate should $0.097 instead of 8 cents per pound, as recommended in the Senate , so that an 8-cent rate per pound for frozen or liquid whole eggs ower in proportion according to comparative values than shell s at 8 cents per dozen.

n the case of frozen or liquid egg yolks the rate based on the actual ntity and value of this egg product, assuming the rate on shell s at 6 cents per dozen as in the Fordney bill, should be $0.077 pound instead of 4 cents per pound, as in the Fordney bill; and rate based on the actual quantity and value of this egg product, ıming the rate on shell eggs to be 8 cents per dozen would mean t the frozen or liquid egg yolks should carry a rate of $0.103 pound instead of 8 cents as recommended for the Senate bill. In case also the 8-cent rate recommended is lower than the estimated ount based on shell eggs at 8 cents per dozen.

s to the frozen or liquid egg albumen the rate based on actual ntity and value of this egg product, assuming shell eggs at 6 ts per dozen, as in the Fordney bill, would be exactly 6 cents per nd for the frozen or liquid egg albumen instead of 4 cents per ınd, as provided in the Fordney bill, and the rate based on actual ntity and value of this egg product, assuming shell eggs 8 cents dozen, would be 8 cents per pound for the frozen or liquid egg umen, which is precisely the same as the rate recommended for Senate bill.

The dried whole egg rates based upon actual quantity and value of s egg product, assuming shell eggs at 6 cents per dozen, as in the

Fordney bill, would mean a tariff duty of 0.225 cents per pound instead of 15 cents per pound, as in the Fordney bill; and for rate based on actual quantity and value of this egg product, assuming shell eggs at 8 cents per dozen as recommended for the Senate bill would be 30 cents per pound for the dried whole egg instead of 24 cents as suggested for the Senate bill. Here again the recommended Senate rate would be considerably less than the estimated rate for the dried whole egg.

For the dried egg yolk the rate based on the actual quantity and value of this egg product, assuming shell eggs at 6 cents per dozen, as in the Fordney bill, would mean an 18-cent per pound tariff rate on the dried egg yolks instead of 15 cents per pound, as in the Fordney bill, assuming the rate to be based on actual quantity, and the value of this egg product, and assuming shell eggs at 8 cents per dozen, the rate should be 24 cents per pound for the dried egg yolks which is the same as recommended for the Senate bill.

Taking the dried egg albumen and assuming the rate based on actual quantity and value of this egg product, assuming shell eggs at 6 cents per dozen, as in the Fordney bill, the rate should be 45 cents per pound instead of 15 cents per pound, as provided in the Fordney bill. Taking the rates based on actual quantity and value of this egg product, assuming shell eggs at 8 cents per dozen, then dried egg albumen should carry a tariff rate of 60 cents per pound instead of 24 cents as recommended for the Senate bill.

From these studies it will be seen that the rates recommended by the poultry producers to be included in the Senate bill of 8 cents per pound for frozen eggs and egg products and 24 cents per pound for the dried eggs and egg products are the same or lower than the estimated rates based on quantity and value of products to be derived from shell eggs bearing a tariff rate of 8 cents per dozen.

TABLE XVIII.

Number of pounds of egg products produced from 1 dozen of shell eggs.

[Average of figures as quoted by the following authorities, United States, in April, 1921: H. J. Keith, Boston, Mass.; Morris-Ovson Co., Chicago, Ill.; Titman-Harding Co., Kansas City, Mo.; H. A. McAleer, United States Department of Agriculture, Washington, D. C. Prepared by the poultry department, New York State College of Agriculture, Cornell University, Ithaca, N. Y.]

Figure 28: One of the facts of great importance for us to bear in mind in considering the effect of foreign competition upon the poultry industry of America is the quick effect that it would have in causing poultrymen to go out of the poultry business. The poultry in- dustry, more, perhaps, than any other branch of agriculture, cer- tainly more than any other branch of live-stock husbandry, is sensi- tive to economic changes of favorable or unfavorable conditions. It is essentially true to say that the number of birds kept in the United States may be vitally changed in a single year, depending upon whether or not the business has been profitable or unprofitable. This is particularly true of all those poultry keepers who are depend- ing to a large extent upon purchased grain and hired labor and to some extent also the small general farm flocks.

This quick response is a guaranty to the consumers of the United States that eggs and poultry will not be higher in price than is neces- sary to yield sufficient profit to induce poultrymen to remain in the business. Coupled with this is the further fact that far more persons including men, women, and children are engaged as personal owners in raising poultry than in any other branch of agriculture. The Government statistics and our own surveys show that 89 per cent of the farms and at least 50 per cent of the people in villages keep poultry. Profiteering is not possible in the production of poultry and eggs. The millions of small poultry producers and laborers who would the be employed in the egg raising of our country are the ones who [illegible] receive the benefits of a wise protective tariff. A few large importing companies are the ones who now profit by having no tariff duty on shell eggs and ridiculously low rates on egg products.

As an illustration of the way in which adverse or favorable con- ditions have affected the poultry industry, from July, 1916, to the present time, primarily due to the World War, I refer to figure [illegible] which shows the variations in the average wholesale price of the highest grade of eggs and of live poultry on the New York market and of feed consisting of the complete Cornell ration for egg pro- duction, month by month, for the time indicated showing the per cent of increase or decrease of the commodities mentioned over the prewar averages for the same months for the years 1914 and 19[illegible] as a base.

For the months of July, August, and September, 1916, the price of eggs as shown by the solid line curve and the price of live poultry as shown by the dash line curve were higher, than feed as shown by the dot and dash line curve as compared to the prewar averages for the same months. Poultrymen, presumably were then making at least small profits. During the next two months, October and November, feed was materially higher and eggs and poultry lower, after which feed continued to rise sensationally month by month as shown by the dash and dot line curve until December of 1917 when it showed an increase of 119 per cent, whereas poultry had increased to about 66 per cent and eggs to only 33 per cent. Poultrymen we[illegible]

ıen rapidly decreasing the size of their flocks or going out of business. This was particularly true of the commercial poultrymen, the ıck lotters, and the suburban poultry keepers who were obliged to ırchase all or nearly all of their feed. The large number of fowls ıing sold and increase of the high price of feed and labor had a ndency to hold down the price of chickens below what it normally ɔuld have been. This was particularly true during the spring and mmer when large quantities were sold and when buyers filled eir storage plants with relatively cheap poultry. The decrease in e number of fowls had a tendency to increase the price of eggs oduced. During this time less chickens were hatched and reared cause poultrymen were discouraged and panicky.

In the spring of 1918 the famous Food Administration ruling against lling of hens during the laying season, February and March, had a rther tendency to cause poultrymen to decrease the number of ickens reared and hence had exactly the opposite effect, as might ve been expected, from what the Food Administration desired to complish. Poultrymen, like all persons engaged in other occupaıns, do business according to the law of "supply and demand," also pressed as "profit or loss," which specifically means that the relıvely low price of eggs and the high price of feed caused poultrymen reduce the size of their poultry enterprises or to go out of business tirely to such an extent that in many sections more than half of the ultry was sold and less than half the normal number were reared. ıny of the poultry keepers have not to the present day returned to eir normal capacity and thousands of persons throughout the intry have postponed their plans temporarily or permanently to gage in poultry farming.

At the close of 1918 poultry was 98 per cent, feed 89 per cent, and gs only 69 per cent higher than the prewar price. Poultry was gher because it was scarcer. It had been to a large extent killed and few reared to replace it, and as a result the price of eggs was gher than at the same time during the preceding years, having vanced from 15 per cent to 33 per cent and then to 69 per cent, spectively, in the three years, for the month of December. But the rease in price of eggs was materially less than increase of price of d. The price of feed has a dominating influence, since it is about per cent of the total cost of egg production, and the labor, not re considered, but under normal conditions is a large factor; about per cent of the cost of production.

In the beginning of 1919 we see an exceedingly favorable condition r poultrymen who had stayed in the business and who had taken eir loss, namely, chickens in February selling for 113 per cent, gs for 66 per cent, whereas feed had dropped to 64 per cent higher an the prewar average for that month. During the first seven ɔnths of 1919 eggs rose from prewar average to 122 per cent, live ultry to 114 per cent, and feed to 103 per cent, and poultrymen re making money. These favorable conditions and bright prosects for profits in the future caused a very large increase in the ımber of chickens hatched and reared in the spring of 1919, which having a marked effect even now on the increased number of eggs oduced. The most sensational increases in prices received for ultry and eggs, however, occurred in the spring of 1920, namely, 9 per cent for eggs and 160 per cent for live poultry.

All records of high feed prices were smashed in June, when th complete Cornell ration was selling for 137 per cent, whereas eggs were 110 per cent and live poultry 101 per cent above prewar average for the same month. This rise in price of feed as compared to egg and poultry was a temporary setback but did not occur until after the hatching season, so that it did not seriously affect the number of chickens hatched and reared and that went into winter quarters, and moreover the price of feed made a sensational drop, beginning in July and continuing consistently each month until 1921 and which nearly bankrupted the grain producers. In December, 1920, feed was only 60 per cent and eggs were only 47½ per cent and live poultry had dropped to 105 per cent, as compared to prewar average and as compared to the same month the preceding year, when feed had been 101 per cent, eggs 70 per cent, and live poultry 116 per cent. The drop in the price of fed was responsible for increases in the number of fowls kept everywhere in the United States.

Beginning with February, 1921, there was a marked general decline month by month almost without exception until June in the price of live poultry and the price of eggs in keeping with the general downward trend of prices of most commodities. Feed remained about the same for May, June, and July until August, when it reached its lowest point of only 5.9 per cent increase over the prewar average, at which time eggs were 72 per cent and live poultry 68 per cent. It is apparent, therefore, that during that time poultrymen should have been making fair profits.

The rapid decline in the price of feed and the slower fall in price of eggs and live poultry during the hatching season, March, April, and May, 1921, as might be expected caused poultrymen to hatch and rear the normal or increased number of chickens so that we will go into winter quarters in the United States with an increased poultry population with prospects of very much larger egg receipts and correspondingly lower prices for eggs and poultry.

For the good of American farmers it is hoped that the price of grain will increase rather than decrease so that it will be above rather than below the prewar level, and that the price of poultry and eggs will decline no faster than other commodities. However, we can expect within the next few years that the curve of percentage increase or decrease in prices of eggs, poultry, and feed will bring them closer together, presumably about where they were before the war and when poultrymen will then feel acutely the effects of large importations of eggs and egg products particularly during the spring of the year when egg prices are lowest and when poultry keepers are making their plans for hatching the next year's crop of chickens for replacement. This is the time of year when the poultry producing and distributing industries are most sensitive to economic changes. It is the poultryman's seed time when he makes his plans for future production. This also is the time when contracts are made by the importers for the entire year in advance for frozen eggs or dried eggs based on the lowest oriental price of eggs during the season of heavy production.

Early in the spring eggs are shipped in the shell from China to be sold on a falling market in January, February and March, whether this is done intentionally or by accident it has the effect of throwing

are into the sensitive egg market and results in helping to further duce the price of American eggs going into cold storage in vast iantities at this season of the year, particularly throughout the eat egg-producing section, and large assembling and distributing ties. It should be clearly understood that eggs are used for gambling irposes and sold and resold on the market much as other commodities e sold. In fact eggs frequently are sold before they are laid hich makes delivery very precarious under normal conditions nsidering the fickleness of hens.

TABLE XIX.—*Cost of Cornell ration per 100 pounds.*

0 pounds consists of 66⅔ pounds grain and 33⅓ pounds mash. Grain: 2 of corn, 2 of wheat, and 1 of oats. Mash: 6 of corn meal, 6 of wheat middlings, 5 of meat scrap, 3 of wheat bran, 1 of oil meal, and 1 of lfalfa meal.]

Figure 29 and Table XXII: Perhaps the most important misconception which has existed in the minds of the people is that eggs and chickens have been high in price. The consumer of eggs and egg products should know that, relatively speaking, considering the prices of other commodities, eggs and poultry have not been high in price. In justice to the producer and the distributor this fact should be clearly understood. The proof of the assertion that eggs and chickens have not been high in price is shown in figure 29, where the wholesale market prices of three commodities, namely, eggs, chickens, and corn, the grain which is most extensively used by poultrymen in America, are compared with the index number of wholesale prices of principal commodities for the years from August, 1914, to October, 1921, inclusive. Here we are able to compare the two principal products which poultrymen have to sell, eggs and chickens, with the principal grain product, corn, which he buys and the numerous general commodities which he purchases and which give us a fairly accurate means of gauging the poultryman's purchasing capacity based on his business returns. The solid black curve shows the average wholesale index number of prices of commodities month by month, from which it will be seen that the prices were nearly stationary for 1914 and 1915 at about 100. Beginning with 1916 the increase in the commodities rose rapidly to 150 for January,

1917, and rose more or less consistently to about 190 early in 191 and to 210 in September of the same year; dropped slightly durin the forepart of 1919, but reached 230 in August, 1919, and was 25 plus in February, 1920; and reached its highest apex of about 275 in May, 1920, from which time there was a marked decline until July 1921, when it was 150, essentially the same as in January, 1917.

During 1914–15 the price of eggs and chickens, as indicated by the dotted curve, fluctuated above and below the price which farmers paid for general commodities, higher rather than lower during 1914 and early in 1915, and slightly lower toward the close of 1915. For 1916, 1917, 1918, and the early part of 1919 the price of eggs and chicke was slightly above that of commodities; but from then on until Octo ber, 1920, the prices paid for chickens and eggs on the New Yor market was materially lower than the price paid for commodities.

During the summer of 1919 and the latter part of 1920 the pric of eggs and chickens was slightly higher for a short period than th general commodities; but since that time the price of chickens ha been decidedly higher and the price of eggs materially lower un September and October, 1921, when the price for eggs was essentia the same as for commodities.

The price of corn not only remained higher than the price of eg and chickens almost continuously until toward the close of 191 with the exception of a short time in 1916, but was also higher tha the price of the general commodities. This was particularly tr during the last two-thirds of 1917 till toward the close of 1919, shown by the dash-line curve.

Beginning with the latter part of 1919 the price of corn declin but was not lower than the price of eggs and chickens until Septemb 1920. From that time on the sensational fall in the price of co was conspicuously and materially lower than the price of eggs the wholesale price of commodities and of chickens.

A general glance at the trend of the curves shows clearly that th prices paid for eggs and chickens have, with very slight exceptio until the latter part of 1920, been lower not only than the price corn but than the price of general commodities. It is very evide therefore, that if there has been profiteering in chickens and egg it has not been the producer who was responsible. Notwithstandin the fact it might appear from the preceding chart, figure 29, deali with the cost of feed and the price received for eggs and from chicke from 1914 to 1921, that the poultryman was making a profit for th most part during 1919 and 1920. A study of figure 29, will reve where the poultryman's actual or imaginary profits have gone shown by the fact that the prices of his personal and home expens have been materially higher than the prices which he received for th things he produced. In other words, his business as such show justifiable profits for 1919–20, but his living expenses outside of h business were materially higher in proportion than his profits. I other words, the people who were manufacturing or producing th things that poultrymen buy were receiving more as a reward f their labor and investment than was the poultryman. That is wh poultrymen quit producing eggs and went to producing commoditi paying larger profits. All of which leads to the final conclusi that the best way to increase agricultural production is b making it possible for a person to secure sufficient reward in th way of living conditions, based on the profits of his business, to ind

m to continue to produce eggs and chickens, for example, rather an to engage in some other occupation. We believe that proper otection by means of an equable tariff on poultry, eggs, and egg oducts is an important way in which persons may be induced to gage in the production of poultry products in America so that the nsumers of America may eat home-grown products not only of a tter quality but at a reasonable price, trusting to the enterprise, ergy, and the education of Americans to increase production so at competition will be between ourselves rather than with the ople in other countries who, because of necessity, are obliged to rk for lower wages and under living conditions which we would t tolerate in America.

BLE XXII.—*Average farm price of eggs, poultry, and corn, and wholesale price of all commodities, 1914–1921.*

erage farm prices of poultry, eggs, and corn from the 1919 Yearbook of the United States Department Agriculture and Monthly Crop Reporter. Average wholesale prices of "all commodities" from reports the Bureau of Commerce and Labor. The 4-year average before the war for each month is 100 per cent.]

I want to thank you for your attention for so long a time. As my last thought I want to make this one appeal: From the standpoint of a person who is more interested in the good of all than in any one particular industry I believe it is appropriate at this time when we are talking so much about this peace conference and about disarmament and about our future military protection to consider seriously our greatest means of national defense—a prosperous and contented agriculture. The history of the World War and other wars has shown that success has been largely a question involving food supply and that our chief hope for recovery lies in feeding the hungry world. The situation in Europe during the war and at the present time shows the penalty of failing to appreciate that fact. America is generations ahead of the rest of the world agriculturally and industrially; agriculturally because of out scientific and educational methods; industrially because of our protective policies. I believe that we should now erect a proper defensive protective tariff that shall give to the American producer of agricultural products the same opportunities for protection that are given to the men engaged in the manufacture of industrial products, so that the things the farmers produce and sell shall have no less and no more protection than the things that they buy. Such a policy will be of greater justice to all and bring greater prosperity for all of our people.

In the production and manufacture of these particular products, poultry and eggs, we have what we can hardly say of any other industry to the same extent, we have the welfare of the American farm woman to consider. It has been estimated that there are more than 5,000,000 of farmers' wives in this country who are responsible for the most part for the production of poultry and eggs, and who are dependent to a considerable extent upon the income from poultry for their spending money and the maintenance of their homes. It is evident, therefore, that anything which affects unfavorably the income of the farmer's wife and children will have a vital influence upon the farm home, and thus upon the welfare and the safety of the Nation.

A large amount of poultry and poultry products is produced by our people in the villages and cities, who will appreciate anything that will enable them to maintain their poultry enterprise as a source of food supply and income. Poultry surveys which have been made in cities and villages of the East show that the poultry and eggs produced within the corporate limits of smaller towns and villages up to several thousand population are frequently sufficient to more than meet the consumption of poultry and eggs of the people living in them. For example, in the city of Ithaca, N. Y., having a population of approximately 15,000 persons, there are over 9,000 hens or a little more than 1 hen to each 2 persons.

Let me assure you at this point that we as poultrymen are willing to "take our own medicine." I am willing, and my colleagues are willing, to pay the extra price on a suit of clothes as 35 per cent duty on the value and 40 per cent on the weight of wool, if necessary, we are willing to pay the extra price of the tariff on wheat from Canada or Argentina or corn from China or any other country, because we believe that in the end we will receive an equivalent in value for the things which we produce that will enable us to pay a higher price, if necessary, for the things which we buy, and that by such a policy

l of us in America can live happier and more prosperous and con-nted lives, can better educate our children, and be better American tizens, and therefore will be better prepared to defend our Govern-ent in peace or war than we can with underpaid agriculture or anufacture, as we find it in the Orient, in Europe, and other coun-ies, where people are working to such a large extent by hand labor id frequently side by side with cattle or mules, and not enjoying e wonderful advantages and privileges which are ours in America. was never so good an American as when I returned to this country id saw that magnificent Statue of Liberty in New York Bay. hen I walked into the customhouse and paid the required amount duty, I did so willingly and was proud of the fact, because I real-ed that much of America's prosperity in the past and ability to cover now is largely bound up in that wise, constructive, defensive licy which up to now has "fostered manufacture by protection and riculture by education," and which now, we believe, should accord e same protection to agriculture that has been for so many years tended to industrial manufacture. The time has come when, not ly as a matter of justice but as a matter of national self-defense, must protect our agriculture by a protective tariff as well as by ucation against the low price of labor and the unequal living con-tions of the people of many parts of the world.

We want New England to buy her grain from the Middle West and populate her farms with chickens more nearly to feed her own popu-ion and the South to produce the products which she is capable of oducing by a diversified agriculture instead of bringing them from her countries, because we realize that the prosperity of each State s to do with the prosperity of the whole Nation.

We believe that America is capable of producing economically all of e poultry and eggs which we consume and to export more than we exporting now. We believe that the large importer and distributor foreign products is the one who principally profits by the products ich are brought into this country, and he does this largely at the pense of the people who produce from the soil or factory, as well as people who consume these products. The main question for us settle is whether we prefer to have American and foreign capital ke profits on products which they can assemble and manufacture re cheaply in foreign countries than they can in America or whether prefer to support the wheels of industry at home or abroad, to ve empty henhouses in America or China, Argentina, or Australia. must ask ourselves which policy will result in greater prosperity America.

I thank you for your attention.

ATEMENT OF B. F. KAUPP, NORTH CAROLINA DEPARTMENT OF AGRICULTURE, RALEIGH, N. C.

Mr. KAUPP. Mr. Chairman, I speak as secretary of the North Caro-a Poultry Association, as chairman of the southern section of the merican Association of Instructors and Investigators in Poultry usbandry, as a southern member of the committee on the protection the poultry industry of the American Poultry Association, and r the poultry section of the Southern Tariff Association.

We of the South are a part of the estimated billion dollar poultry dustry, and as such we ask to speak.

Millions of dollars have been spent in the South, as in other sections of the United States, in the education and in the development of the poultry industry. In 1919, 12 Southern States spent $1,416,4[illegible] in investigational work along agricultural lines, a due amount of which was devoted to poultry investigation—page 89, Work and Expenditures of the Agricultural Experiment Stations, 1919, United States Department of Agriculture—and a similar amount was spent to take these facts through the extension service to the men and women on the land. I might add that a similar amount was spent by the agricultural colleges of these States in teaching our young men and women and another similar amount was spent in the farm life schools of these same States in education along agricultural production lines.

This work has borne fruit and has made our southern families happy, for the bulk of the returns in money in the sale of poultry and eggs has gone to the home, to the housewife, who now has a [illegible] to her to aid her to provide her table and to help clothe and send [illegible] children, the men and women of to-morrow, to school.

While poultry production work is carried on in the South in three ways, namely, commercial poultry plants, the back-town lot, and as a department of the farm, yet the bulk of our southern eggs come from the farm, which may be compared to your small wagonload of wheat, or your small drove of farm hogs, or the small dairy farm. Like these the eggs and the fowls make up a mighty industry.

While this happy situation has been going on, other things have been happening. In far-away celestial China the hens, homeless we are told, by the millions, scavenger their feed, which includes all that they can find in the way of scattered grain and table scraps, and reliable information tells us that human excreta forms part of the foraged food. So foul and polluted are these eggs that while [illegible] was in Paris this last summer my eye caught a short article in a Paris paper, in which my friend, Dr. Martel, at the head of the health work in Paris, found the bacterial study such that he forbade the entry of Chinese eggs into France. We are told that the Chinese hen is not fed wholesome feed as the American hen and hence the eggs are not of as good quality.

A flood of Chinese eggs is ever increasing on the American market. So much so that the southern poultry man, the back-lot poultry keeper, and the commercial egg farm man can not produce eggs profitably unless there is some protection.

In 1913 there was exported from China 20,796,400 pounds of albumen and yolks, and in 1919 this had increased to 80,0[illegible] pounds. The value of this and shell eggs in 1913 was $4,3[illegible] and in 1919 it had increased to $33,883,259—extract from the Supplement to Commerce Reports, December 7, 1920, page 19, Department of Commerce, Far Eastern Division—and from the same report under date of October 7, we find that no less than 95,438,955 fresh eggs were exported from Shanghai during the first half of the year against 20,200,000 for the same period in 1918.

The value of poultry in the farms of 12 Southern States in 19[illegible] was $29,647,500—page 309, Chapter II, Thirteenth Census of the United States Abstract for North Carolina—and at the present values this would be at least $88,942,500; and the 1920 census will swell this amount. This is for farms alone.

It is our public policy to protect the American manufacturer from eap labor and manufacturers of other lands that do not have high ing standards. It is equally just and fair to protect our farmers, io own and operate the factories where the food is produced for ding the Nation, from ruinous competition of other lands. We erefore, in all fairness, ask a fair and proper tariff on foreign eggs, lieving that it is right and just that there should be on eggs and ultry of foreign lands a protective tariff at a rate sufficient to ord the American farmer and his wife a living wage.

Mr. Frank L. Platt in a letter to our Secretary of Agriculture, Mr. allace, as quoted by the American Poultry Journal, of Chicago, 's:

he poultry industry in this country represents small units; the producers are adequately organized, and yet the importance of the egg money to the mer's wife is known to every one who, like yourself, knows agricultural condi- is. No source of income does more to better conditions in the farm home. We st not allow competition from the Orient to continue unrestricted and develop.

We, therefore, to equalize or bridge the differences in cost of pro- ction and delivery between China and the South, ask the fol- ving tariff on Chinese eggs: Eight cents per dozen upon shell gs, amendment to paragraph 713; 8 cents per pound upon frozen gs, amendment to paragraph 713; 24 cents per pound upon ied eggs, amendment to paragraph 713; 4 cents per pound upon ultry, live, amendment to paragraph 711; 5 cents per pound on poultry, dressed, amendment to paragraph 712.

The average price of eggs at Shanghai in the spring of 1921 has en around 13 cents per dozen for shell eggs, according to informa- n on file in Far Eastern Division of Department of Commerce, and, ding this 8-cent tariff upon shell eggs, makes 21 cents per dozen; d 23 cents at the larger markets is about the price of spring eggs in nerica. This advantage, while slightly in China's favor, will come ar breaking even.

In the South much of the feeds must be imported from the West. e price of poultry feeds on the Raleigh market for December, 1921, fair example of southern prices, was: Prepared laying mashes, $4 r 100 pounds; and for grain mixtures, $2.25 to $3.50 per 100 unds. For corn, 83 cents per bushel; for oats, 68 cents per bushel; r wheat middlings, $37 per ton; cornmeal, $43 per ton; and for ound oats, $42 per ton.

An average hen will eat about 80 pounds of feed per year, and at e December prices would be for feed alone $2.60. If the average mmercial hen lays 120 eggs, or 10 dozen, this would cost for feed one 26 cents per dozen eggs. The average unculled farm hen lays t about 72 eggs, or 6 dozen a year.

The marketing costs are as follows:

Marketing costs.

t of egg crate	$0.35
press, Raleigh to New York City	1.43
e per cent for selling (estimate)	.50
Total	2.28
st per dozen for marketing	.075

We are simply asking you to bridge in the difference there betwee costs, but we do not want southern farmers and families living on th Chink standards of living.

I have just one graph, which I would like to refer to briefly t show what the Chinese importations of eggs did last year.

(At this point Mr. Kaupp exhibited to the committee the grap referred to.)

The black line [indicating] represents the price of eggs in 19 It cost us $3 to feed a hen a year in 1920, and by the latter part of 1921 the cost of feed had shrunken 13½ per cent, and on that basis of feed the eggs should sell at 13½ per cent less than they did in 19 That would be the yellow line [indicating].

About the fore part of the year the Chinese eggs that are importe had reached the eastern seaboard, and the latter part of January or thereabouts there was at least one boat load of 400,000 pounds of eggs brought in from China, which was at a time when we were be ginning to get the spring flush, especially from southern hens, an at a time when our American storage people are unloading their storage eggs. On top of this came this heavy importation of Chinese eggs, and instead of going down 13 cents, as you see, the 1st of Feb ruary, the eggs started on a toboggan here [indicating] the latte part of February and made a diagonal slide for two solid months striking far below the line they should have struck according to th cost of production. They ranged 25 cents for four straight month the months when our American farms are producing the most of thei eggs.

Senator SIMMONS. Did you say they sold at 24 cents?

Mr. KAUPP. This is a map, Senator, of New York City. Th data here that I gave is data which has been gotten out by Prof. K of Cornell University, and took the average price for several n mal years on the New York market, for the months of Februar March, April, and May, the four flush months—I did not mean th for the entire year, because the price of eggs varies according to th season of the year. The bulk of the eggs——

Senator SIMMONS (interposing). I was interested in where dur the past year you may have bought eggs at 24 cents a dozen.

Mr. KAUPP. In North Carolina the eggs on many farms on brought 15 cents a dozen, and I have made inquiries recently and fi that in some localities——

Senator SIMMONS (interposing). What part of North Carolin I live in one part of that State, and I did not hear of that.

Mr. KAUPP. You do not have to go very far from Raleigh, bec the Raleigh markets are usually higher than some of the oth markets. Statesville is a low market.

Senator SIMMONS. What are they selling now for at Raleigh?

Mr. KAUPP. They are retailing there at 50 cents, but the produ does not get the retail price. They get about 10 cents less.

Senator SIMMONS. You were talking about the wholesale price?

Mr. KAUPP. I was talking about the wholesale price, and the wh sale price particularly at the time of the year when the bulk of eggs are produced.

Senator SIMMONS. But the consumer buys eggs at retail, and I inted to know if you desired to have the consumers of this country have to pay more for eggs than they are now. I think they are mewhere around 50 or 60 cents now.

Mr. KAUPP. This is a winter month. They went up to 50 or 60 nts.

Senator SIMMONS. They were 70 cents retail, though they may be wn to 50 or 60 cents now.

Mr. KAUPP. They will not be that low in February, March, April, d May, when the bulk of the eggs are produced.

Senator SIMMONS. The wholesaler must make an enormous profit, cause I do not think eggs have been below 40 cents in this country ywhere along this coast at retail for some time.

Mr. KAUPP. In some sections and in the smaller towns in North irolina the farmers are getting 30 or 40 cents a dozen on the farm st now. and they will not get nearly that much when you get the ish season, in the latter part of February, and in March, April, d May. Those are the four months when the bulk of the eggs are oduced.

Senator SIMMONS. That does not signify anything to me. I am inking about what the man who actually buys the eggs has to pay, d you are the first man whom I have heard say that eggs are too eap in this country and that you want to do something to make em higher.

Mr. KAUPP. They are too cheap when they sell for less than cost production, we believe.

Senator SIMMONS. They may be to one person, but they are dear ough to the man who has to buy them.

Senator McCUMBER. Do you consider the farmer is receiving ough when he receives 15 cents a dozen?

Mr. KAUPP. We can not produce them for that.

Senator McCUMBER. Or 20 or 25 cents a dozen, if he got that as an erage the year round; it would still be too cheap, would it not?

Mr. KAUPP. If you allow the Chinese eggs to come in and break e price.

Senator SMOOT. Could I send down to Raleigh and get a case of gs at 40 cents?

Mr. KAUPP. You can in those months when more than 60 per cent our eggs are produced.

Senator SMOOT. I mean to-day?

Mr. KAUPP. To-day, of course, is the time when the farmers are tting very few eggs; that is the reason why they are high in price.

Senator SIMMONS. I see here in the Monthly Summary of Foreign ommerce for the 11 months ending in November, 1921, there were ported from this country 30,505.463 dozens of eggs, of a value of 441.962. In the same document I read that the importation of gs into this country for the 11 months ending November, 1921, ere 2,991,562 dozen of the value of $900,003, eggs dried and frozen. 920.270 dozen of the value of $306,484. That does not indicate any ry enormous importation as compared with the exportation?

Mr. KAUPP. Senator, have you the importations there by month

Senator SIMMONS. I have it here for the 11 months.

Mr. KAUPP. The average for the 11 months?

Senator SIMMONS. No; not the average. I have it for the 11 months ending November, 1921.

Mr. KAUPP. But have you it by the months? The bulk of the eggs——

Senator SIMMONS (interposing). That is the total including all those 11 months.

Mr. KAUPP. But what is going to happen if they send boat load after boat load over here in February and March?

Senator SIMMONS. It is included in this.

Mr. KAUPP. That average has a tendency to dilute this. You can do a great deal of injury to it in a short time—for instance, suppose were 60 days—whereas, if you spread it out it does not seem so serious

Senator WATSON. Do I understand that you hold some official position?

Mr. KAUPP. I am at the head of the poultry work in North Carolina, and I am secretary of the State Poultry Association and a member from the South on the committee on the defense of the poultry industry of the American Poultry Association.

Senator MCLEAN. What does it cost to produce a dozen eggs North Carolina?

Mr. KAUPP. In 1920 it cost $3 to feed a hen a year. The average commercial hen will lay 10 dozen eggs. The average farm hen does not lay up to that mark. That would be 30 cents; but in 1921 the cost is less than that; it is $2.60 a hen, according to our figures, and that would make it 26 cents a dozen. That is for feed alone.

If we market them in New York City it will cost us 7½ cents a dozen. That allows 35 cents for the eggs, $1.43 for the express and 5 cents for selling. It costs $2.28 to market a case of eggs.

Senator SIMMONS. But do not those figures I have just read show you that the eggs that are coming here from abroad are practically all frozen or dried eggs?

Mr. KAUPP. I think approximately 80 per cent come in in a frozen state. I have not the exact figures, but it is in that neighborhood.

Those eggs are used by bakers, and the baker men do not buy shell eggs, and they automatically pull down the whole structure.

Senator FRELINGHUYSEN. You spoke of $33,000,000 being the amount of imports. Does that include the 95,000,000 fresh eggs you spoke of?

Mr. KAUPP. The total value of imports of albumen, yolks, and shell eggs was $4,000,000 in 1913 and $33,000,000 in 1919.

Senator FRELINGHUYSEN. Would that include fresh eggs?

Mr. KAUPP. That includes shell eggs.

Senator FRELINGHUYSEN. Desiccated and fresh?

Mr. KAUPP. And frozen.

Senator SIMMONS. You say, 1919?

ſr. KAUPP. 1919; yes, sir. This was taken from the supplement he Commerce Reports.

enator SIMMONS. How many dozen were imported in 1919?

ſr. KAUPP. I have not got the dozens. I have the albumen and ks; they have not been separated out.

enator SIMMONS. During the 11 months of 1921 the fresh eggs came in only amounted to $900,000?

ſr. KAUPP. That report was 95,000,000 fresh eggs or shell eggs ught into this country. This is 1919, Senator.

CANARY BIRDS.

[Paragraph 711.]

STATEMENT OF C. E. RICHARDSON, WASHINGTON, D. C.

ſr. RICHARDSON. This is a matter so small that it has probably ped the attention of the Ways and Means Committee. I speak for the little yellow canary, the cheerful companion and enterer of children and invalids. This little songster has, through no t of anybody in particular, been classed with poultry, parrots, ridges, and other fowl.

he Fordney bill, at paragraph 711, provides:

rds, live: Poultry, 2 cents per pound; all other, valued at $5 or less, each 50 cents.

here is nothing in this clause that is applicable to canaries; if d as poultry they would not yield enough to compensate for hing them, and as other birds the rate would be extortionate. take the liberty, Mr. Chairman, of suggesting that paragraph 711 mended by inserting, after "all other," the words except canaries, that the free list include "canary birds."

anary birds are imported for their bright, lively music. I was at to say "as pets," but only the males are singers, and only they in demand. Producers, however, will sell song birds only if the haser buys an equal number of females. This increases the nse very materially, because the females cost about one-fourth uch as a male and just as much for freight, care, and feeding.

male canary costs, during the summer months (and a little less in winter) nominally $3.50, but in reality more than twice that sum, n you consider the price of the female mate, and add the freight, ents, and feed and care, 50 for each of them, and allow the rate of 50 per cent as mortality loss. The females are sold for t they will bring, and the losses have to be made up by the sale he singer. The importers, in most cases, are satisfied with a ent profit.

is said that there are 40,000 people in the United States who ve their living from bird stores, and that many such establishts would be forced to close if a duty of 50 cents per bird were ed upon canaries.

r. Chairman, I am not a free-trader. I have never appeared re your committee, nor before the Committee on Ways and Means, pt to advocate what I thought was an adequate protective tariff; I never before had a canary bird for a client; and when I think

of how the little fellow brightens the nursery and cheers the bed-ridden sufferer, forgetful of the fact that he himself had been kid-napped, carried to a foreign country and sentenced to solitary con-finement for life; when I think of the corners that he has brighten- while laboring under the heaviest kind of odds, Mr. Chairman, I fe too much respect for him to insist that he bring 50 cents in his b to pay for the privilege of making our children happier with h cheerful song. For one, Mr. Chairman, I am willing, not to be free trader, Mr. Chairman, but to extend to Mr. Canary the court-sies of the port.

The imported canary is not a competitor with any Americ institution, industry, or trade. None of the finch family and ve few of the canaries will breed in this country. Some tailors an shoemakers, and perhaps a few dressmakers, have raised a brood he and there, which can not exceed in the aggregate 10,000 birds a ye but these, if salable, would not supply one week's demand in t country for canaries.

If any duty is to be assessed against canaries, it should be a ve modest one, and it should, by all means, be restricted to the male. the female, unlike the human family, is absolutely valueless. But country in the whole world, so far as I have any information, M Chairman, has ever put an import tax on a canary or even co templated so doing; and I feel quite certain that you gentlemen w want to see that the bill is corrected so that the people who deal the little songbirds will not have to give up their trade; not only their sake, but that the sources of good cheer may not be entir banished from our land.

FRESH, FROZEN, AND DESICCATED EGGS.

[Paragraph 713.]

STATEMENT OF ADOLPH J. GUNDERMAN, NEW YORK CITY, RE RESENTING THE NEW YORK STATE ASSOCIATION OF MAST BAKERS.

Mr. GUNDERMAN. I represent about all the bakers of the East States east of Chicago, from Maine to Florida, and the New Y State Association. I also represent the master bakers of Manhatt whose representative is unable to be here.

We desire to protest against the tariff on eggs, coconuts, almo walnuts, and filberts. We feel that the tariff ought to be left way it is on all those articles.

Senator WALSH. You mean the Underwood tariff, not the em gency tariff?

Mr. GUNDERMAN. The old Underwood tariff; yes, sir.

The great trouble that we have now—and I am speaking for bakers only—is that they want a cheaper price for their go During the war we got pretty good prices, but it cost us so mu more in addition to produce the goods, and we feel that if you crease the tariff on eggs it will increase the cost of eggs to us as bak and, naturally, we will have to charge that cost to the consu We as retail bakers come closer to the people than anybody, mor

an the wholesaler or the egg handler does. We have to stand the unt of the kicks, and we have stood enough of them for the last o years.

Senator McCUMBER. Have you any method of determining and ring to the committee figures showing the profits of the producer eggs as compared with the profit of the bakers in their business?

Mr. GUNDERMAN. No, sir.

Senator CURTIS. What kind of eggs do you use—seconds?

Mr. GUNDERMAN. We mostly use firsts in the shell eggs.

Senator CURTIS. You use a first-class egg, but they call an egg at is cracked a second, do they not? You use cracked eggs?

Mr. GUNDERMAN. We use some cracked eggs.

Senator CURTIS. And dried eggs?

Mr. GUNDERMAN. Dried eggs and frozen eggs.

Senator CURTIS. Where do you get your frozen eggs from, mostly?

Mr. GUNDERMAN. We buy them through a jobber.

Senator CURTIS. They are imported from China, are they not?

Mr. GUNDERMAN. Yes, sir.

Senator CURTIS. You get your dried eggs from China, also, do you t?

Mr. GUNDERMAN. Yes, sir.

Senator CURTIS. And you also get fresh eggs from China?

Mr. GUNDERMAN. Some.

Senator CURTIS. If you import them do you know what your eggs st laid down to you?

Mr. GUNDERMAN. No, sir.

Senator CURTIS. What do you pay for eggs?

Mr. GUNDERMAN. Frozen eggs to-day will cost you about 30 cents ound.

Senator CURTIS. How much for the dried eggs?

Mr. GUNDERMAN. The dried eggs will cost you about 75 cents.

Senator CURTIS. What do eggs cost you by the dozen?

Mr. GUNDERMAN. The shell eggs cost about 50 cents.

Senator CURTIS. A dozen?

Mr. GUNDERMAN. Yes, sir.

Senator SUTHERLAND. Do you refer to imported eggs?

Mr. GUNDERMAN. No, sir; the State eggs, domestic eggs.

Senator CURTIS. How much do your imported eggs cost you?

Mr. GUNDERMAN. I do not know what the imported shell eggs cost.

Senator WALSH. Do you get eggs from Canada?

Mr. GUNDERMAN. Yes, sir; some. They run about the same price the domestic eggs, as a rule. They are a little smaller eggs.

IEF OF ADOLPH J. GUNDERMAN, REPRESENTING THE NEW YORK STATE ASSOCIATION OF MASTER BAKERS.

In behalf of the retail bakers of the Eastern States, the New York State Association Master Bakers, and all affiliated bodies, we hereby desire to enter a protest against change in the tariff schedule, particularly paragraphs 713–756, relating to eggs, nuts, almonds, walnuts, and filberts, on the ground that any increase in the tariff these goods would reflect from the wholesaler to the retail baker and naturally to consumer, and we feel that the day of high prices is at an end, and for economic ons which you well know we feel that you ought to leave the matter stand as .

STATEMENT OF JOHN M. HARTLEY, REPRESENTING RETAIL BAKERS' ASSOCIATION OF AMERICA, CHICAGO, ILL.

Mr. HARTLEY. The retail bakers collect from the ultimate con- sumer. We are in a position to estimate how any increase in th price of raw material will be received by the consumer. It is in th last transaction over the counter where all customs or duties a received, and passed back from there to reimburse those who ha already paid. That is why I believe you who have the burden finding approximate justice from the apparently conflicting clai of these many witnesses should hear the view of the small baker.

Eggs are part of our daily material. Besides being used in cooki pie fillings, coffee cakes, and other sweet yeast doughs, they are use most heavily in cakes, carrying from 25 per cent of the materia value of the cheaper cakes to 75 per cent of the value of sponge cak angel food, and sunshine cake. Eggs have always been our mo variable cost factor. Not until the development of frozen eggs, and later of powdered eggs, has it been possible for the smaller bakers t carry a fixed egg cost through a season. Even now when we use shell eggs a considerable variance occurs in the price. But the tenden is for a better spring price and a lower midwinter price. I subm that these modern methods of caring for our egg wants has take considerable speculation out of the egg business. No one woul venture to suggest to return to the old method of cheap eggs spring and a prohibitive price in winter.

Following cold storage, freezing and dehydrating have added the ability of civilization to spread the egg harvest over the le productive months. A duty too high will restrict these mode methods. Any restriction at all will reflect mostly to the specula market. Neither production nor consumption will profit, as the ga in the last selling price will accrue to the handling agencies and absorbed before it reaches back to the egg producer. That is com mercial history. Although the housewife uses neither the froz eggs nor the powdered eggs, her interest in the household suppli can easily be affected if our manufacturing classes are serious shortened.

I believe we are about the only ones who use dehydrated, powder and frozen eggs.

Directly, as almond nuts, and indirectly, as almond paste, we sm bakers are large users of these nuts. Irrespective of the claims the domestic growers, we do not, and in many instances can not u the California almonds. In fact, the limited supply of the Californ nuts hinders them from being a regular trade commodity with us are the known varieties of imported nuts that we use. Domestic pr duction is always welcome with our trade when it comes with me and a reasonable assurance of standarized quality and a permanen of supply. We fail to find any reasonable assurance of supply t commercial needs in the future of California production of almond If what I suspect is true, the chief gainer in the prohibitive duty ask by the growers will be the land promoter. In very few sections a they a sure-fire crop, a point not always emphasized by the la sellers. The high duty that you gentlemen will be urged to exte

this commodity will act merely as a subsidy to some very en-usiastic but very questionable promotion schemes. I will submit series of display advertising that run last winter in a Chicago inday paper. They then offered wonderful returns on investment thout high tariff—or perhaps in answer to anticipation. I will do is if I can possibly secure copies. I remembered that they had peared, and I looked through the files of the Tribune in the ashington office last night, and I found a series of display advertise-nts from Paso Robles, Calif., but we will not talk about that now.

Walnuts are also of daily use with us and have been a profitable p with the walnut growers along the coast. Without a prohibitive iff they are an inviting investment where they will thrive. With a hibitive tariff against import competition, they won't thrive any tter on lands or in districts not suited to their culture.

Filberts are not grown to any extent in this country, so it is likely it you will be allowed to use your judgment peacefully in finding air revenue duty.

Coconuts in various forms are a big thing with us and have brought ich revenue to the Government through quantity. I think quan-y usage will serve a useful revenue purpose, and having always car-d some duty, and not interfering with domestic production, it is sible that you will be able to find a rate that will hold quantity ge and return good revenue to the Government.

As a small merchant and coming in contact with the public, I take e of the store every Saturday night, and I know the public. We d out quite a few things. You gentlemen here will hear more of details, but this is one of the things we have found out:

The capacity of people to do without has never fully been measured. who are doing business over the 2-foot counter know how they discipline any trade, any line, or any one article that they feel is ng sold beyond its value. Value is largely a matter of tradition; at they paid yesterday or paid last year. In 1916 the housewives ke the egg market in Chicago by refusing to buy. Last crop year s estimated that about 10,000,000 barrels less of flour was consumed this country.

Flour was higher traditionally than potatoes; potatoes were cheap. ility to do without and the capability of finding a replacement icle will upset all schemes and theories however good. This human ment is what will make your decisions either successful or unsuc-sful both in the eyes of the people and in your Treasury Depart-nt. All down the line from producer and importer, through manu-turer or handler to baker, we are all of small moment. The real s is on the other side of my counter, and it does not pay to forget it she is there.

Gentlemen, I can not offer you—I am not capable—any suggestions. ist merely wish in thinking of this not to allow sectionalism to put remendous weight on the rest of the country.

Senator McCUMBER. I wish it were possible for you to give us a icrete case. A cake, say, will weigh 3 pounds; give us the pounds the material that is used in that, and what you sell it for to the ail trade, or give us some idea of the relation between the material the product on the cost to the consumer.

I know there are so many different kinds of cakes in which you u- eggs in these days, and I could not, not being a baker, give you th- contents of one cake and ask you what it cost you and what you s- it for, and so I would be glad if you could give us some idea along th- line.

Mr. HARTLEY. I can. I could to a small extent from memory no- but if you gentlemen would like I will submit to you our costs on t- regular retail lines.

Senator McCUMBER. I often have to go down here to a baker a- buy a cake, maybe in order to have one for Sunday. I do not kn- how much it would weigh, but it cost a matter of $1.50 to $2. Know- ing something about flour, I would say it contained 5 cents' worth flour, maybe 10 cents' worth of eggs, and 3 cents' worth of suga- and I can not give you the rest, but there is a good deal of differen- between $2 selling price and 25 cents' worth of material.

Mr. HARTLEY. Well, Senator, let me say, I do not do that clas- trade. I am in an apartment-house district. Our two-layer cak- sell for 50 cents, and we always figure in our line that the mater- cost is roughly on the full line 50 per cent of the selling pr- Another 50 per cent is the labor cost, the overhead, rent, and the other things; and I will be very glad to submit you a real, outri- statement of how that works out. Then you can submit it to t- gentlemen in the Bureau of Standards to check up.

Take, for instance, angel food. Angel food is nearly all whit- egg. There is a heavy labor cost involved in making such cakes am not a cake maker myself, and I can not give you the exact figu- but there are the items of labor, sugar, and a little flavoring. Tha- absolutely all there is in that angel cake. In some kinds of cakes whole egg is used. For layer cakes there is a different recipe entir- Fat also enters into that, but the cheapest cake you can make. sells for $1 in an ordinary district—I am not talking about a high-class place—but in the ordinary district where the big bul- the 30,000 or more bakers of this country do business—the ge- cost is 50 per cent of the raw material. If you pay 50 cents f- cake, if it is larger and of a cheaper quality, you may be sure t- one-fourth of the material cost will be in eggs. If it is sunshine ca- you may be sure that 75 per cent of the material cost will be in eggs, because eggs always are our highest and most variable factor. This spring they have been cheaper than they have been a long while.

The small baker has no means of contracting for storage eg- Since frozen eggs have come in—I do not say that I use them. I am too small a baker to use them—but since frozen eggs and powde- eggs have come in, we find the storage people are more read- contract with us, for, say, 25 cases of eggs at $2 down for the win- months, and then permit me to pay the balance at 5 cents a do- carrying charge as they are withdrawn from cold storage. Of cour- we can not raise our price very well. We figure on a level pri- There is nothing that disturbs business more than fluctuatio- prices. In winter, if we get caught, we have to stand for it. paid as high as 70 cents last year, during the winter, we little fel- that did not have much stock, whereas the men who could u-

ons of the frozen eggs would have had those contracted in the spring or 33 cents. Of course, they can buy cheaper in the spring in the helled eggs.

Gentlemen, this is a point I want to emphasize: I believe that the revenue will come to you more through usage than it will through restriction of usage on anything that you wish to take up.

STATEMENT OF C. GORDON WILSON, SECRETARY EGG PRODUCTS ASSOCIATION OF AMERICA.

Senator McCUMBER. Mr. Wilson, you are going to discuss the same subject, eggs, are you?

Mr. WILSON. I am, Mr. Chairman, with your permission. I represent the Egg Products Association of America, which is an association of importers of egg products. I am myself connected with Henry W. Peabody & Co., who are international merchants, exporters and importers.

As importers, we are not going to fall into the natural path of asking free tariff on egg products. On the contrary, we would like to bring about the highest possible duty that these eggs can stand, so that the Government can get the most revenue. We do not say that from any philanthropic motives whatever. The duty is simply a part of our cost, like freight or finance. It is simply added to the other costs and the public has it to pay. There is a danger of getting that duty so high that the public will balk and refuse to buy our commodity. In that case the Government will not receive any revenue from the importations, as we will stop importing. So I think I might say that our viewpoint is analagous to that of the Government, as we are perfectly willing to stand all the traffic will bear, but the minute you have too high a tariff we will lose our commission.

The quality of these eggs has been spoken of before the House Ways and Means Committee, and I wish to say something in regard to that. These dried eggs are nothing more or less than eggs with the moisture driven out through a dehydrating and heating process. They are pure, clean eggs.

Senator CURTIS. Many of those dried eggs are made from the cracked eggs that are not fit for the market but yet are perfect eggs. Is not that true? For instance, the wholesale egg dealer gets in a case of eggs. He finds among them a dozen cracked eggs. Those cracked eggs are good but he can not sell them to the market, and he dries or freezes those eggs.

Mr. WILSON. I should be very reluctant to contradict any statement you make, Senator.

Senator CURTIS. I do not ask you to contradict me. I asked you whether or not that is a fact.

Mr. WILSON. No; it is not a fact. The people who dry these eggs have their agents go out into the interior of the country and buy them. It is probable that some of them may become cracked, and they still use them. But I mean to say that they buy all the eggs they can get their hands on, good, bad, and indifferent.

Senator CURTIS. I know that; but what I am saying also is that the egg dealer sells to the trade these cracked eggs at a lower price.

Mr. WILSON. I am not equipped to give information on that point.

Senator CURTIS. And if he does not sell cracked eggs at a lower price, and finds that he can not get rid of them, he dries or freezes them, if he has the apparatus with which to do that; and if he can not do that, he turns them over to some one who can.

Mr. WILSON. To the best of my knowledge, there are no plants in this country for dehydrating eggs.

Senator CURTIS. They all come from China?

Mr. WILSON. To the best of my knowledge, they do. There were some small plants here, but they have been discontinued; they were found to be unprofitable. These dried eggs are taken to the Department of Agriculture immediately on their arrival here; and we, as importers, have to put up a bond which secures us from running away with these eggs before the Government is through with them. The department takes them and analyzes them in order to make sure that there is no injurious matter contained in them and that they are fit for human consumption. After they are through with them, they release them to us, and we can dispose of them in any way we see fit. If they do not find them proper eggs, we can not bring them in.

Those eggs are not even cold-storage eggs. The cold-storage facilities in China amount to practically nothing. They have not any arrangements for carrying cold-storage eggs. They could not use spoiled eggs. The minute you put one in a run of eggs, it would not make any difference after the eggs were dehydrated; you could still detect it very distinctly from the odor, if from nothing else. The percentage of bacteria would be increased to such an extent that any chemist could recognize it immediately.

The principal users in this country are the bakers and the manufacturing confectioners. The uses for other purposes are so small that the amount used would be negligible. The small baker uses these eggs primarily. The small baker has no facility for preserving eggs and, therefore, if he buys shell eggs he must lose a big percentage because of the fact that they go bad before he can use them, particularly this time of the year. I know that they will keep at least two years without having changed one particle.

Then the confectioner uses the whites of eggs almost entirely. If he buys shell eggs, he has to throw away the yolks. He can buy albumen dried separately. So he has no loss whatever; he has them in the same convenient form so he can keep them indefinitely.

We believe that the home industry should be protected. They can not compete with the cheap Chinese labor. Now, who would be protected if you put on a high tariff? The egg producer of this country gets most of his eggs in the spring and summer months; in fact, the supply of eggs during the spring and summer months by far exceeds the demand, to such an extent that the public can not possibly take over all the supply.

Senator CURTIS. April and May, you mean?

Mr. WILSON. It runs into June sometimes. It varies according to the season.

Senator CURTIS. I come from an egg country.

Mr. WILSON. Well, you are better equipped to speak of that than

But there is a period of the year when the majority of the eggs 'e produced. At that time the public can not consume all of them. he small baker has not the capital with which to buy his eggs at one me. He could not preserve them if he did that. He can only buy s immediate demands from day to day. The same thing is true with spect to the householder. Of course, some of them do, to a small :tent, and put down eggs in water glass, etc. The only people in is country who are able to take up this excess supply of eggs when ey are very cheap are the packers. The packers buy these eggs cheaply as they can get them. They are buying them this year 20 cents. They hold them in cold storage until the market goes), when the fowls are not laying eggs any more. Then they sell em at a fair margin of profit; I believe not profiteering, probably, it at a healthy profit.

Senator SMOOT. What rate do you want? This bill provides 15 nts; the Underwood bill provided 10 cents per pound. What do u want?

Mr. WILSON. There are three forms of eggs: Dried albumen, dried lk, and dried whole eggs. The present law provides 3 cents, 10 nts, and 10 cents.

Senator SMOOT. You want 15 cents per pound and 10 cents?

Mr. WILSON. No, sir; I was speaking of the existing tariff. What was about to suggest was that the yolks be fixed at 7 cents per und, that the whole dried egg be fixed at 10 cents per pound, and albumen be fixed at 12 cents per pound. That is figuring it out an advance of 25 per cent on the present tariff.

Senator SMOOT. Dried eggs how much?

Mr. WILSON. Ten cents.

Senator CURTIS. Do you import shell eggs?

Mr. WILSON. No, sir. When anyone has imported shell eggs he s met with a financial catastrophe. There have been tremendous ses experienced in that.

Senator CURTIS. I do not see how you account for that. In 1914 ey imported eggs from China and sold them in Kansas City at 18 nts a dozen and made money.

Mr. WILSON. How much did they cost?

Senator CURTIS. I do not know.

Mr. WILSON. The man sold them in Kansas City, but I am speaking rely of the importer. My margin of profit is from 1½ to 2 per cent. at is what the importer gets.

The only danger is in getting it too high, so that the public will not y. We believe if you go much above this mark, you will have iched that dangerous point.

It has been stated that it takes three and a half dozen eggs to make pound of dried eggs; and that is true. But when you have conrted them back, you have destroyed certain properties. Certain ysical properties have been broken down, so you have lost a great gree of efficiency, estimated from 20 to 50 per cent.

I think that is all I have to say, Mr. Chairman. With your persion, I would like to file a brief.

Senator MCCUMBER. You may do so.

BRIEF OF C. GORDON WILSON, REPRESENTING EGG PRODUCTS ASSOCIATION OF AMERICA.

The interests which I have the honor to represent are primarily and almost ab- importers. From this statement you will assume that I am going to ask that desiccat egg products be put on the free list, or, failing that, that they be taxed as small a d as possible—that I believe is the general request from importers. But to the contra believing that it is necessary for the Government to raise revenues through imp duties, and also believing that there are certain industries in this country that c not successfully compete with foreign industries of the same general nature. I a going to ask that the duty be placed at such a rate that the Government may rea the greatest possible return in the way of revenue through duties on desiccated e products imported in this country and at the same time give ample protectio the domestic producers in this country. I make this statement from a sense of patri duty. From a standpoint of the business it does not make a particle of difference t interests I represent how high the duty on desiccated egg is put, so long as it is n put so high as to exclude its import, and in this I think that the Government i accord, as should the duty be raised so high as to exclude its import the Governm would then be defeating its own purpose, as there could be no revenue derived such a tariff if there were no imports. We all purchase our desiccated-egg product China, to which cost we have to add the freight to this country, the marine insura premium, and the cost of financing and the duty then existing. In this way we arr at our costs and add our commissions, and so arrive at the price which the public have to pay. Now, if the duty is so great that the selling price amounts to more the public is willing to pay, then there is no sale, and if there is no sale we will n import, and if we do not import then the Government will not collect any revenu far as the duty on this commodity is concerned. If I have made my point clear will then realize that the Government interests and the interests I represent analogous, i. e., we both want the highest duty possible without curtailing the imp and therefore I am anxious to throw all the light possible on this question and every possible assistance to the end that a fair and equitable duty may be levied.

In the first place, the desiccated eggs, which we import solely from China, are simp strictly fresh hen eggs with the moisture driven off. It is not possible to manufact from anything else but strictly fresh eggs, there being no cold-storage facilities availab for preserving eggs in China, and if a single bad egg should be used it would spoil entire run, as it would be easily detected even after the egg was desiccated. The Department of Agriculture holds for inspection every shipment that arrives in the Un States and will not release any shipment until a rigid examination is made an eggs determined fit for human consumption. This in itself is guarantee that desiccated egg offered by the importers for sale in this country are desirable as a commodity, notwithstanding all that has been said to the contrary.

The desiccated egg is used primarily by the bakers and to a small extent by confectioners. Other than these two uses, the uses are so small as to be negligibl The bakers who use the desiccated egg are for the most part the small bakers who ha no facilities for the keeping of shell eggs such as cold storage, and if they are f by a prohibitive price, which can only come about through too high a duty be levied, to use shell eggs it will mean that they will have a serious loss to face thr the fact that they will have to lose a good portion of the eggs which they buy thr the eggs spoiling before they can use them, which loss is of course simply figured the cost of production and is passed along to the public, resulting in the disappeara of the cheap cake from the market, or the use of an egg substitute which ha nutriment.

As to the confectioners, they use only the albumen, or whites of the egg. If t have to use shell eggs it will mean that they have to throw away the yolk, while if t can get the desiccated product they can buy the albumen separated. Right h a big saving caused not by the cheapness of desiccated albumen, but simply by t form it is in. Albumen, by the way, is not cheap and does not find a market th the fact that it is cheap, but by virtue of its form.

From this you will see that there is a danger of putting on such a high duty tha bakers and confectioners can not use the desiccated-egg products, which will re in the importation of desiccated eggs being discontinued, and the Governm being deprived of the revenue.

As for the protective phase of the subject, let us consider who it is that a high d will protect. The poultry farmer gets the bulk of the eggs in the spring and sum months, at which time the egg markets are down, due to the fact that the supp this time of year exceeds the demand. The small bakers throughout the cou are not able to buy up eggs at this time for anything more than their imm

nands. So they benefit very little by the low prices. The poultry dealer can not p them himself, as he is not equipped to carry eggs over until the markets go up, l consequently is compelled to sell at the then prevailing low prices. The packers n come into the market and buy the eggs at the cheap prices and store them in ir cold-storage warehouses and hold them until the winter months, when the supply resh eggs is far less than the demand, with the consequent high prices, of which the kers are the sole beneficiaries, not the poultry producers. Who, then, would a h duty on egg products protect? Government statistics show that the number ggs exported exceed the number imported. On the whole, I think that I am justi- in stating that the protection to home industries phase of the question is negli- e and might well be ignored without damage to the poultry producers, there ıg absolutely no manufacturers of desiccated eggs in this country. The question, refore, resolves itself down to how much duty the dried eggs can stand without pping the importation altogether, and thereby depriving the Government of an reciable amount of revenue derived from the moneys collected as duty on desic- d-egg products.

ı order to determine the maximum of duty that desiccated-egg products will stand, ust be considered entirely on the basis of a separate commodity absolutely isolated ı the shell egg, as its form is so different, the processes which it has to be put through re it can be used by the consumers, the bakers, and its efficiency as compared ı shell egg, that it really can not be considered on the basis of a competing commodity ı shell egg. If the desiccated egg is put out of the market through too high a f, the bakers will use cheap egg substitutes made from starch rather than shell . While it takes about three to three and one-half dozen shell eggs to manufacture und of desiccated egg, it does not follow that one pound of desiccated egg will make e dozen eggs. The desiccating of the egg destroys certain properties of the egg ch makes it less efficient than it was in its original form. Again the efficiency of desiccated egg varies so widely that it is not possible to make a parallel with shell

The only basis for determining the amount of duty that can be levied without ing the importation prohibitive is a practical basis. It is the consensus of opinion the present price without the duty on whole desiccated egg of 35 cents per pound on desiccated yolk 25 cents per pound and on desiccated albumen 50 cents per od is about normal. The ocean freight is about as low as can be expected and ange is about normal, which makes to-day's prices about normal. Add to to-day's es the duty of 7 cents per pound on dried yolks, 10 cents per pound on dried whole , and 12 cents per pound on dried albumen and you have about the maximum es on desiccated-egg products that the consumer will pay or can afford to pay. ı is a tremendous advance over the present duty, roughly 250 per cent, but we rilling that this advance be put in effect, as the business will stand it and the Gov- ıent needs it. If it is put higher it will injure the business and curtail the imports, t cut the imports off altogether, and in turn deprive the Government of revenue it would otherwise receive, and in addition the public would be deprived of lesome food at a reasonable price.

ı conclusion, I beg to state that should the duty be raised above the figures above tioned the result would be that the price would then be prohibitive to the public, interests which I represent will simply sell our stocks, which are already in the ıtry and duty paid, at a handsome profit and discontinue the business, as we all ı have plenty of other business, this desiccated-egg business being only a small of our business, but, of course, we would have to forego the commissions we now in from this particular commodity and the Government would also lose the duties h it enjoys from the importation of desiccated eggs.

TEMENT OF EUGENE H. HICKOK, NEW YORK CITY, REPRE- SENTING THE AMERICAN ASSOCIATION OF THE BAKING IN- USTRY.

Ir. HICKOK. Mr. Chairman and gentlemen, I am Eugene H. kok, representing the American Association of the Baking Indus-. Senator Curtis raised a very important point in the egg- ervation question. The baking industry has been built up in last 10 years to $60,000,000 or over invested in large cake-baking nts, to say nothing of the smaller cake-baking plants. That has eloped on the use of eggs that have been damaged in the packing. Then the egg comes into the egg-packing plant it is sold by the ner as a perfect egg, and in the handling it is checked or cracked—a

percentage of about 3½ to 5 per cent. The farmer is not interest in those checked or cracked eggs; he has sold them; that is th packer's business. The bakers buy those eggs because they are jus as good for baking as the fresh western eggs, and they get them a about 3 cents per pound, or 3 cents a dozen, which is the same thing cheaper than they can get the fresh western eggs.

Frozen eggs are contracted for the whole year, because the bak has to know where he is driving to and he has to know where he i going to be able to get these eggs.

Several years ago when breaking stock began to get scarce, o account of the growth of the baking business, Americans went abr and established factories there for the manufacture of frozen eg from Chinese eggs to supply the bakers. In other words, it wa the baker who did not want to compete with the housewife for th fresh western eggs who started egg freezing in China. It was start as a conservation measure and has resulted in expansion into Chi under American standards for the benefit of the baker and the con suming public.

Senator McCUMBER. The baker did not want to compete with th housewife?

Mr. HICKOK. He did not want to pay the price.

Senator McCUMBER. But he was perfectly willing to compete wi the housewife of the farmer?

Mr. HICKOK. No; I think not. He was perfectly willing to co pete with the packers, because the farmer, who had sold his egg the packers, had lost all interest in them.

To show you that the packer is the one that will be benefited, the detriment of the baker, I will quote from the Federal Trade Co mission's report, Part IV, on the meat-packing industry, page 1 published on June 30, 1919:

> The five big packers are the dominant factor in the wholesale handling of dr poultry and eggs. Estimates by individual members of the trade on the extent which their firms or localities have suffered in recent years at the hands of the pa run from 60 to 90 per cent, and frequently include the expression that for the ter locality they have substantial control. For the country as a whole, trade estim place the quantities of dressed poultry and eggs shipped by the packers in 191 over 65 per cent of the total shipped from producing areas to consuming centers.

Senator SMOOT. Will you tell me just what you are requesting this? Is it the same as that requested by the previous speaker?

Mr. HICKOK. Yes. We are requesting that the frozen-egg tariff not increased——

Senator SMOOT. You mean the Underwood tariff rates?

Mr. HICKOK. No; that they be not increased more than 100 p cent on mixed frozen eggs and on frozen yolks, and that they be n increased more than 400 per cent on frozen albumen over the Und wood bill rates.

Senator CALDER. How much does this bill increase frozen albumen

Mr. HICKOK. That is just what it does. The present bill passed the House does just exactly that thing.

Senator SMOOT. Then, you are satisfied with that increase?

Mr. HICKOK. I am satisfied with that as the last thing that we stand.

Senator SMOOT. In other words, you do not want these rat increased?

Mr. HICKOK. I do not want them increased.

Senator SMOOT. You are satisfied with them as they are?

Mr. HICKOK. I am satisfied with them as they are on frozen eggs; s, sir.

Continuing in regard to the packers' control of this industry, and further show that the housewife is not interested, and that if a rge tariff is placed on frozen eggs it will merely mean that many illions of dollars will be taken out of the baking industry and the nsuming public and paid over to the packers if a high tariff is aced on these eggs——

Senator LA FOLLETTE. Well, do you not call 400 per cent a high tariff?

Mr. HICKOK. I call that high but equitable. In other words, that akes the frozen-egg rate 4 cents per pound. That is what the Ford-y bill has it.

Senator CALDER. What is the rate under the present law?

Mr. HICKOK. Under the present law it is 1 cent on albumen, frozen bumen; 10 per cent ad valorem on yolks; and 2 cents on mixed.

Continuing with the Federal Trade Commission's report, page 140:

> Throughout the country, however, but especially in the great consuming markets New England and elsewhere in the East, there are many concerns conducted under mes other than those of the big packer companies which are not directly subsidiary those companies, but which are owned or controlled by members of families control- those companies. These concerns do not secure all their supplies through the big cker companies or their subsidiaries, but purchase also from independent packers d candlers of dressed poultry and eggs.

The farmer is out of it; he has sold his eggs; and the packer is otected by a high tariff. And if a high tariff is placed on the portation of Chinese eggs, it will merely mean that the level of e checked and cracked eggs will be brought up to the same point the fresh western eggs during the packing season. Therefore e packers will get about 3 cents a pound more for their cracked gs, because after they are broken for freezing they are just exactly good as perfect eggs.

Senator McCUMBER. You say the farmer is not interested; that e only benefit that will accrue at all will be to the packers?

Mr. HICKOK. Yes, sir.

Senator McCUMBER. You assume, then, that knowledge that any antity of eggs may come in at a low rate of tariff will have no fect whatever upon the price that the farmer receives for his pro-ict at the time that he sells it?

Mr. HICKOK. Yes, sir.

Senator McCUMBER. It will have no effect on him?

Mr. HICKOK. You probably have heard that the egg market was oken by the Chinese eggs this spring. I wish to say that during e year 1920, of the total production in the United States, only e shell egg was imported for every thousand that were produced; d that for every thousand that were produced, 15 eggs were ex-orted.

Senator McCUMBER. You say shell eggs. What was the entire nportation of all of the eggs, both the frozen and the dried eggs— ecause they all affect market—what were the importations? tate their equivalent in dozens or any unit you see fit to use.

Mr. HICKOK. I should say probably 3 per cent. These shelled and dried eggs do not compete with the farmers' eggs because not one of them is used as a table egg. It is merely a baker's material, and the only interests involved here, as I see it, are the bakers, who reflect through the consumers, and the packers' interests.

The importation of shell eggs amounts to almost nothing. What broke the market was that the hen out in the country began to lay, and we had an early spring. There were twice as many eggs came into the New York market, and they did not come from China, either; they came from the farms, during the spring months, twice as many as came in the year before, and that is why the market was broken.

Senator GERRY. Do you contend that the only people competing in the importation of eggs from China are the packers?

Mr. HICKOK. Yes, sir.

Senator GERRY. And that, therefore, this raise in duty will only help the packers?

Mr. HICKOK. Yes, sir.

Senator GERRY. And, therefore, it is to his advantage and to the advantage of nobody else?

Mr. HICKOK. Yes, sir.

BRIEF OF EUGENE H. HICKOK, REPRESENTING THE AMERICAN ASSOCIATION OF THE BAKING INDUSTRY AND RETAIL BAKERS' ASSOCIATION OF AMERICA.

DEVELOPMENT OF AMERICAN CAKE INDUSTRY.

Commercial cake manufactured in the bake shops of America is consumed by classes; in fact, the art of cake making in the bakeries has developed in the past years to such an extent that home cake baking has been materially reduced. C is a staple necessary food. It has become an important item in the daily diet of m than 20,000,000 people. Workers in the offices, professional people, and shop work make it an important part of their lunch and dinner meals. This is not a condit of long standing, but has developed in the past decade for the reason that egg produ have become standardized, so that the baker can use them on a large scale in the p duction of cake and get the required richness into the cake to make it both palat and nutritious.

Cake is not a luxury. It is a necessity. If we are to consider that sugar, milk, e and butter are necessities, then we shall have to consider also that cake is a neces Bearing upon this point, there is submitted below for consideration the affidavit Dr. Harry E. Barnard, director of the American Institute of Baking at Minneap Minn.

"I, Harry E. Barnard, being director of the American Institute of Baking at Minn apolis, Minn., Federal food administrator for the State of Indiana, late State food a drug commissioner of the State Board of Health of Indiana, director of the Americ Chemical Society, member of the American Public Health Association, member of t American Association of Chemical Industry and numerous learned and scient societies—late associate editor of the food department of the New York Evening M author of many special papers, dealing with the subject of food and nutrition, do m affidavit as follows:

"I am by experience, both in the manufacture and chemical analysis of c familiar with its composition and nutritive value.

"Cake is a well-known article of diet, prepared from simple basic food mate and generally served as a dessert, or to complete the meal. Cake consists of a mixtu of varying amounts of flour, sugar, butter, and eggs, with or without additional fla colors, and secondary ingredients such as fruits, nuts, etc.

"The food value of cake is determined by the amount of flour, sugar, butter, and e incorporated in the loaf. There is no difference in the food value of flour as used i cake from that of a similar amount of flour used in the manufacture of bread. The food value of the sugar is likewise the same, whether it be used in cake or other fo

ffs. This is also true of the butter and egg. Each of the several ingredients used he manufacture of cake is a staple food. The flour, sugar, butter, and egg, which, en compounded, produce cake, are most important food materials, and furnish necessary food essentials, such as carbohydrates, fat, and protein, in proper form easy and complete assimilation at minimum cost.

The difference between bread and cake lies first in the greater quantity of sugar d in cake. Second, in the use of butter as a shortening material instead of lard or etable oils, and third, in the use of egg instead of yeast, as a leavening agent. use of additional quantities of sugar, as a frosting or icing, still further increases food value and furnishes the sweet so commonly desired at the close of a meal. increasing use of cake is due in part to the fact that it appeals to the palate of the sumer—but still more to the fact that it supplies in such palatable form the food ntials the body requires.

Cake is composed of ingredients of high food value and is a concentrated food, ishing more calories or energy-producing units than bread or more simple comnds of cereals.

It is not a luxury, for its ingredients are staple foods, constantly used in other as on every table. The mixture of these staples in the manufacture of cake does remove the product from the list of staples, nor does the use of these staples in the of cake warrant the conclusion that cake is an unessential food or a food which ld be denied the masses of consumers. On the contrary, the use of cake is conive to the well-being of the consumer, since it furnishes essential and necessary materials in a desirable, attractive, and pleasing form.

Any increase in the cost of the raw material entering into the manufacture of e, or of labor, or of the cost of transportation and distribution is an added burden he family purse and an increase in the cost of living.

"HARRY E. BARNARD.

Subscribed and sworn to before me this 16th day of June, 1920.

"JOHN M. BARBER, *Notary Public.*"

he ingredients that enter into cake constitute a more balanced ration than almost other food placed upon the table. The ingredients are all recognized as wholee food. Up until the time that eggs were prepared in dried and frozen forms ers were greatly handicapped by reason of work required in breaking out the eggs the shell and the fact that they were not at all standard in quality. Musty eggs ld get in and spoil the whole batch of cake dough. The egg stock which is used reparing domestic frozen eggs is not in general the same as appears upon our breaktables. In the handling of eggs it is impossible to prevent breakage, and about 5 per cent of all the eggs brought into the market become checked or cracked in dling. They would not keep in storage nor could they be consumed to advantage n the table as first-class eggs. It is mostly from these eggs, having checked or ked shells,[1] that frozen eggs are prepared in the United States. They are not disered to be damaged until they reach the egg-packing plants, and when they are ed over those that are cracked or checked are separated and used to manufacture en eggs for the bakers.

p to a few years ago the cake business had not developed so as to consume these ked and cracked eggs, and large quantities of them were wasted. Cake sales end upon quality. The bakers have found that when they put sufficient eggs their cake to make it attractive people will buy it, and that has been responsible great extent for the growth of the cake industry. As the bakery cake has become e and more in demand, the supply of cracked and broken eggs from the egg-packing nts of the United States has become insufficient to produce all the frozen eggs reed in the baking of bakery cake and pastry and it has in recent years been found essary to prepare frozen eggs in China to supplement this bakery material.

he product is entirely wholesome whether prepared in the United States or China. United States Agricultural Department has said in Bulletin No. 729, published 918, that frozen eggs are perfectly wholesome up to two years from the time of zing.

ome of the plants established in China for manufacture of frozen eggs are under supervision of Americans who have been sent over there to prepare frozen eggs the American bakers. Several of the same firms who manufacture frozen eggs he United States operate in China also. The same high sanitary conditions are ntained whether manufacture is carried on in the United States or in China. (See

---

[1] ncludes also eggs having soiled shells, undersized eggs, etc.

extract from Report of Commissioner of Agriculture Benson, of Washington Sta[illegible] Appendix 1 of this brief.)

The bakeries of the United States consume from forty to fifty million pound[illegible] dried and frozen eggs per year. Of this the cracked and checked eggs from the [illegible] packing plants of the United States have in recent years furnished about one-hal[illegible]

Frozen and dried eggs from a commercial standpoint are purely a baker[illegible] material. They are in the same category with sugar, flour, butter, and milk. E[illegible] substance constitutes probably the most important ingredient; therefore, the ma[illegible] tenance and the expansion of the cake-baking industry depends upon securin[illegible] adequate supply of frozen and dried eggs at a reasonable price. If the price of in[illegible] dients becomes too high, the resultant increase in the selling price of the cake ma[illegible] it too expensive for general consumption; in other words, people will not buy the [illegible] if it costs too much. Of course, there have been numerous so-called egg substi[illegible] upon the market, which some of the bakers have used to a considerable extent, [illegible] nothing has been found to take the place of eggs in baking cake.

If the bakers are forced to abandon the use of imported frozen and dried eggs in [illegible] manufacture of cake and pastry by reason of increased tariff, it will mean higher [illegible] for wholesome food to the consumer, decreased production for the bakers, and [illegible] enue for the United States Treasury. Unless we can make wholesome and palata[illegible] cake at a low cost, we can not expect to keep up the production which we have [illegible] up by great effort and the expenditure of upward of $50,000,000 in bakeries [illegible] equipment.

CORRECTION OF FALSE STATISTICAL INFORMATION.

There is so much false information being put before Congress by the Pacific [illegible] poultry associations and others that we deem it worth while to review some [illegible] fallacies.

The United States Department of Agriculture has estimated that 1,957,[illegible] dozen eggs were produced in the United States in 1919, according to Agricult[illegible] Department Yearbook for 1919. The importation to the United States during [illegible] whole of 1920 was only 1,708,701 dozen. This, you will observe, was less than [illegible] tenth of 1 per cent of the total egg production. It can hardly be said that one-t[illegible] of 1 per cent of any commodity would be sufficient to materially affect the mar[illegible] In other words, it is a long stretch of imagination to arrive at the conclusion th[illegible] egg imported for each 1,000 produced would affect the market, especially in [illegible] of the fact that fifteen times as many shell eggs were exported as were imported.

The following table shows the importation of shell eggs by months for the year [illegible] and the first two months of 1921:

Imports of eggs into the United States, by months and countries, for the year 19[illegible] January and February, 1921, expressed in quantity.

t will be observed that more shell eggs were imported in January, 1921, than during previous month covered by the table. This is quite logical, as it is the tendency ill commodities to follow the best markets, and with the higher grades of eggs ing at more than a dollar per dozen in January, at New York, and lower grades ing in proportion, it is not at all strange that eggs from Canada and from China uld seek market in the United States.

t can not be said that this quantity of eggs imported in January had any appreci- e effect upon the breaking of the market. When the weather came on warm in uary the hens began to lay, and this produced eggs upon our farms in such quantity t it more than supplied the demand for high-priced eggs and they continued to r in from the farms until the market was entirely broken. In New York the rket was effectively broken in February, when the receipts were 487,209 cases or 516,270 dozen for the month. This was the greatest egg receipts for February in ny years.

otwithstanding the fact that prime shell eggs were selling throughout the United tes in January at something over $1 per dozen, frozen eggs were selling at a lower re than at any time during the previous year; namely, about 30 cents per pound. ll eggs can be substituted and used by bakers for frozen eggs, but involves a con- erable expense, but frozen eggs can not be substituted or fill the demand for shell s. In other words, frozen eggs are not generally used upon the table and are used ost exclusively as a baker's material. If frozen eggs could have been used to e the place of shell eggs, they would have been used this past year to replace ll eggs, which were selling at about $1 per dozen while frozen eggs were selling at cents per pound, representing the substance of approximately a dozen shell eggs.

uch stress has been laid by advocates of high egg tariff upon the importation of ll eggs from China, but it will be seen that during the month of February, in which nth the market was broken, more shell eggs were imported from Canada to the ited States than from China to the United States.

he careful student of the situation would also note that during the year 1920 the ited States exported 26,841,772 dozens of eggs and imported 1,708,701 dozen. other words, our exports were about fifteen times the amount of our imports, the ports being less than one-tenth of 1 per cent of eggs gathered. All the eggs pro- ced in the United States upon farms, henneries, etc., embracing the total eggs hered in the United States are increased only to the extent of one-tenth of 1 per nt by the total shell eggs imported, and after using all shell eggs needed in the ited States we still have for export fifteen times our total imports.

he one factor which influences prices of shell eggs in the United States is the ather. If the weather is warm early in the spring, the hens will lay enough eggs break the market, which is exactly what they did this spring.

he receipts in New York market during March, 1921, amounted to 979,513 cases, ich is nearly double the New York receipts for March of last year.

n this connection it appears that we should examine rather closely the apparent ect, or rather lack of it, which a tariff has had upon egg prices during the past years. At the very best, Chinese shell eggs can compete with storage eggs only, by the time they get over here from China they are themselves storage eggs, ving been in storage for several months.

Below is submitted a tabulation of monthly average egg prices in New York City [illegible] the better grades for the past 25 years, showing also the tariff rates which were in e[illegible]

Year.	Receipts, New York.	Western finest.	Western regular, packed, first.	Refrigerator, first to finest.	Tariff rates.	Im-ports [illegible]

[1] From statement prepared by Department of Agriculture, Bureau of Markets, Apr. 11, 1921.
[2] And free. [3] Free.

It will be noted that during most of the years in which the high prices prevail[illegible] shell eggs there was no duty on them. It is a mistaken idea to believe under th[illegible] statistical facts that importation or tariff on shell eggs could have any probabl[illegible] fluence upon the price.

The interest of the baking industry require that Congress be not misled by im[illegible]sible statements of facts even though they be honest errors.

The foremost statistician in the egg industry is Mr. Frank G. Urner, of the U[illegible] Barry Co., 173 Chambers Street, New York City, editor and publisher of the [illegible] York Produce Review and American Creamery.

Realizing that the statements presented to Congress by those who are requ[illegible] prohibitive tariff are not founded upon knowledge of the situation, but are mere g[illegible] leading to fallacious conclusions, Mr. Urner has in his publication of April 6, 1[illegible] pointed out some of the fallacies in a rather exhaustive article, from which we h[illegible] quoted in appendix 3 of this brief.

Conclusions have been reached by those advocating high tariff without weigh[illegible] economic causes. Influenced by erroneous statistics, the poultry association[illegible] sent two men traveling over the country presenting their contentions, as to the [illegible] matter, to agricultural conventions throughout the Middle West and have [illegible] by false representations, probably without knowing that they were false, res[illegible] calling for prohibitive tariff on Chinese eggs. They are including frozen and [illegible] eggs in their campaign for no reason at all, and seem to lose sight of the fact that [illegible] and dried eggs do not compete with shell eggs and can not be used as substitu[illegible] shell eggs, being purely a bakers' material.

In trade papers Mr. H. W. Kerrigan, secretary to the Petaluma (Calif.) Chamber [illegible] Commerce, is reported as saying at Peoria, Ill., on March 3, at the convention [illegible] Illinois Poultry Association, as follows:

"In 1914 eggs imported principally from China amounted to $1,000,000. [illegible] the war Chinese eggs went principally to Europe. In 1920 the imports of the U[illegible] States increased $16,255,000 over 1914. Since January, 1921, up to the present [illegible] they figure up to $10,000,000, and it looks like they will reach $50,000,000 for [illegible]

In order that the interests of the bakers and the consumers of bakery products [illegible] not suffer by impression created by erroneous statements, we feel it our duty to [illegible] out the real status of these imports.

The total importations in 1920 of shell eggs from China was 846,863 dozen, which were appraised by the United States customhouse officials at $228,371, instead of $17,255,000 as stated by Kerrigan. Continuing, then, Mr. Kerrigan's statement that since January 1, 1921, to March 1, the imports had amounted to $10,000,000 and would probably reach $50,000,000 before the end of 1921, it appears from Government statistics (see table below) that the shell-egg importation from China amounted to $138,825 in January and $48,242 in February, and that not a pound of frozen or dried eggs were imported from China to the United States in January, and that 295,616 pounds, valued at $52,544, were imported in February. In other words, the total importations of eggs and egg products for January and February, 1921, from China to the United States, including shell eggs, frozen eggs, and dried eggs, amounted to the sum of $239,611, instead of $10,000,000 as stated by Mr. Kerrigan, an exaggeration of something more than 4,000 per cent.

The following table compiled from Government statistics is hereby submitted:

Value of eggs, shell, dried, and frozen, imported from China in January and February, 1921.

[Statistics furnished by Bureau of Markets, U. S. Department of Agriculture. Prepared March, 1921.]

	Shell.		Dried and frozen.		Total value shell, dried, and frozen.
	Dozen.	Value.	Pounds.	Value.	
January	532,195	$138,825	....	....	$138,825
February	203,770	48,242	295,616	$52,544	100,786
Total	735,965	176,067	295,616	52,544	239,611

WHERE IS THE REAL INTEREST IN HIGH TARIFF ON FROZEN AND DRIED EGGS?

A farmer does not produce dried or frozen eggs, and a high tariff on eggs in these forms would not benefit him. When he sells his eggs to the market, he sells them all as shell eggs; in fact, he does not sell checked or cracked eggs to the market, but these imperfections develop in handling. A large part of the cracked eggs from which frozen eggs are manufactured are the property of the big Chicago packing interests. Damaged shells develop at the egg-packing plants, and possibly the Chicago packers are interested in having high tariff on frozen and dried eggs. It would increase the price that they could secure for breaking and freezing stock; in fact, it would entirely exhaust this class of eggs and make a small added demand for first Western eggs at low prices during the spring when eggs are at their cheapest, but not enough to affect the market. The Chicago packing houses would on account of high tariff secure nearly as much for their checked and cracked eggs as the market price for undamaged eggs. This would work off from the market also the checked and cracked eggs which now finally reach the households in the poorer residential sections of the cities at a low price during the spring months, and would take from the poorer classes of city consumers the opportunity to get underpriced eggs.

As conditions now exist, about one-half of the supply of frozen eggs used by the bakers are imported from China. The rest are manufactured in the United States mostly from eggs with damaged shells.

Notwithstanding the many arguments which have been advanced by those in favor of a prohibitive tariff upon eggs and egg products, the bakers of the country feel that we should have certain fixed definite rights, which should not be taken away from us by mistaken sentimental considerations. The total importation of frozen and dried eggs in the United States for the year 1920 was 29,022,572 pounds. The total eggs gathered in the United States is estimated for 1919, by the Agricultural Department, to be 1,957,000,000 dozen and in 1920 more than 2,000,000,000 dozen. Approximately a dozen eggs make a pound of eggs frozen. Therefore, the total frozen and dried eggs imported in the United States in 1920, which was somewhat more than previous years on account of growth of the cake-baking industry, amounted to less than 1½ per cent of the total egg production of the United States. Yet this is what the cake-baking industry relies upon for its life. These frozen and dried eggs, amounting to only 1½ per cent of our egg production, are imported to supplement the supply to bakers at the same price that they pay for domestic frozen eggs which are manu-

factured largely from cracked or checked eggs from the large packing warehouses of the country. If a prohibitive tariff is placed upon frozen eggs it will mean that fresh western eggs would have to be broken to help out the supply to the bakers, and as soon as any great proportion of fresh western eggs are broken for freezing purposes it will mean that all of the domestic cracked and checked eggs will assume practically the same price level as fresh western eggs. Upon consultation with the best authorities in the baking industry upon the economics of the situation, it is contended by some that egg substitutes made of cornstarch, gum arabic, etc., would be used quite extensively as a substitute for eggs in cake baking in case the higher price levels of frozen and dried eggs should be forced by a prohibitive tariff.

People will pay only about so much for a cake, and when you get above that price level they will not eat it. The cake-baking industry has been developed up to a magnitude of total cake production in the United States in 1920 estimated at 300,000,000 pounds, valued approximately at $100,000,000. This industry in itself if segregated from all other manufacture would furnish employment to more than 20,000 persons, which is probably 100 per cent more than were employed in the baking of cake 10 years ago. This growth is the result of progress which the bakers have made during the past few years by reason of better quality. This has been induced by the ability of the bakers to get a free flow of frozen and dried eggs the year round at a level price, and it would have been absolutely impossible to have developed this industry without the importation of Chinese frozen and dried eggs. The economic point of unrestrictive production is quite sensitive, and an addition of even a small percentage in the cost of production of cake, reflected in selling price, is immediately followed by decreased consumption. Therefore, instead of continuing our line of progress, by which we have in the past few years doubled the consumption of bakery cakes, if the tariff on frozen and dried eggs is unduly increased, we shall find that the industry on account of economic conditions is retarding instead of progressing. This in turn will decrease the number of employees necessary and will also decrease the consumption of flour, butter, and milk, in all of which our American farmers are much interested.

It will also detract from the nutritive quality of the food which our office and factory workers will consume for their noonday lunches and dinners. One feature which is outstanding is the fact that in China the eggs used for breaking and drying purposes are not eggs of damaged shells. The natives eat these, and, contrary to our American custom, the eggs of damaged shells are the first to be consumed in China. This is because there are no public cold-storage plants in China and the eggs are brought in perfect condition direct to the egg-freezing plants. Therefore, in reality, the competition is between the fresh "run of the lay" eggs of China and the eggs of damaged shells which develop in the egg-packing plants of the United States.

Since the cracked or checked eggs used for freezing in the United States develop in the egg-packing warehouses, it becomes of interest to ascertain who would be benefited by the creation of an artificial demand for them by a high tariff. I quote from report of the Federal Trade Commission on the Meat-Packing Industry, Part IV, published June 30, 1919, page 133.

"POULTRY PRODUCTS.

"*Section 1. Buying and selling operations of the five greater packers.*—The five greater meat packers, with their affiliated and allied companies, engage in every phase of the poultry products trade. Their operations cover practically every section of the United States and reach even into foreign countries.

"*Buying operations.*—They secure a large part of their poultry products through the poultry and egg buying stations and packing plants which they control. The commission located 102 poultry and egg packing plants which are controlled by them and 247 buying stations through which these plants secure their supplies.

These buying stations and packing plants are located largely in the Middle West, principally in the States of Iowa, Missouri, and Kansas. Some of them are operated by the meat-packing companies direct, and some of them are operated by subsidiary, affiliated, or allied companies. For example, a great number of the Swift buying stations and plants are operated by subsidiary and affiliated companies of W. F. [illegible] Co., a Swift subsidiary, whereas many of the Armour stations and plants are operated by the Kentucky Creameries, Aaron Poultry & Egg Co., A. S. Kininmonth Produce Co., and Nicholson Ice & Produce Co., Armour concerns.

"The locations of the 102 controlled poultry and egg packing plants and the buying stations through which supplies are purchased, with the names under which they are operated and their exact relations to the packers, are given in Exhibit VII.[1]

"The following table is a summary of that exhibit:

[1] Exhibit VII is contained in Appendix 2 of this brief.

ABLE 36.—*Number big packer poultry and egg packing plants and buying stations, grouped by States, 1918.*

It will be seen from the exhibit that in many cases poultry and egg packing plants not given as having any buying stations. In some cases this may be due to the that the buying stations for the plants were not returned to the commission. It is due to the fact that the plants have no buying stations as such, but buy regularly certain country dealers. In many instances these country dealers sell all of their ucts to the packer's plants, and in some cases these dealers are financed by the er plant, and in other cases they buy from producers and sell to the packer plants commission basis. So the packers' plants in reality have a larger number of ing stations than is indicated by this exhibit.

The packer buying stations buy most of their poultry products directly from the ucers. Many of them also buy from country collectors and local grocers who have ht from the producers, and some of them also buy from local poultry and egg pers.

In addition to buying poultry products through their controlled poultry and egg ing plants and buying stations, they also buy as well as sell through their regular ch houses and slaughtering plants. This is particularly true in the Southern s and on the Pacific coast, where they have few specialized poultry agencies. branch houses, like the poultry-packing plants and buying stations, buy from ucers, country collectors, local grocers, and local dealers.

* * * * * * *

ction 2. Position of the five greater packers in the poultry-products trade.—The five packers are the dominant factor in the wholesale handling of dressed poultry and . Estimates by individual members of the trade on the extent to which their firms or localities have suffered in recent years at the hands of the packers run 60 to 90 per cent and frequently include the expression that for the firm's locality have substantial control. For the country as a whole, trade estimates place the tities of dressed poultry and eggs shipped by the packers in 1917 at over 65 per of the total shipped from producing areas to consuming centers. * * * ughout the country, however, but especially in the great consuming markets of England and elsewhere in the East, there are many concerns conducted under

names other than those of the big packer companies which are not directly subsi... to those companies, but which are owned or controlled by members of famili... trolling those companies. These concerns do not secure all their supplies through t... big packer companies or their subsidiaries, but purchase also from indep... packers and handlers of dressed poultry and eggs."

If these recent reports of the Federal Trade Commission are to be taken as auth... we must concede that the chief beneficiaries in a high tariff on frozen and dri... would be the five big packers mentioned in the above quoted report.

The principal losers would be the bakers of the country and the consumers. ... importation were practically cut off the United States Treasury would also be a l... It is quite likely that our foreign trade would be a loser, for if we are to pro... market for our goods in China we must provide also a market for their goods in ... United States.

WHAT THE BAKERS OF THE UNITED STATES WANT.

The baking industry has been developed to the extent that it is now among ... leading industries of the United States in the value of products manufactur... to a few years ago the cake-baking industry was not such an important part as i... now grown to be, but we believe that Congress should think very carefully bef... tears down the development which the cake bakers of the country have made du... the past few years and which has been contributed to largely by their ability to ... frozen eggs from China. One might say, "Why not freeze all the eggs necessary ... the United States?" The answer is that the traffic will not bear the use of dom... perfect shelled eggs at the prices which they command upon the market. In ... that the bakers may keep cake upon the market at a price at which the people ... buy it, they must be able to get their eggs at the price commanded by the ch... and cracked eggs used in the manufacture of frozen eggs in the United State... they must be able to supplement this supply by importation of frozen and dri... from China.

We are willing, and we believe that the country at large is willing, to meet ... tariff problem upon the economic basis of the equalized difference between t... of production in the United States of frozen eggs under present conditions ... cost of importing frozen eggs from China. As heretofore stated, there is n... enough eggs with damaged shells available from the egg-packing plants of the U... States to manufacture the frozen eggs used by bakers. If you cut off the oppor... of the bakers to have this supply supplemented by importation at an equal ... including tariff, you are retarding the cake-baking business to a very larg... and you are also taking away from the poorer people the opportunity to get wh... nutrition in the form of wholesome bakers' cake. The farmers will not be ben... for the real interested parties are the egg-packing companies and not the farm...

It is our understanding that the policy of the administration is to imp... tariff that the cost of production and importation of foreign products shall ... to the cost of production in the United States.

The bakers of the country do not feel that Congress would be helping the ... if it should take millions of dollars out of the development of the cake-baking ... and also from the tables of the consumer to increase the price at which the bi... might sell their cracked and broken eggs, and hence their profits.

Let us meet this question squarely regardless of prejudice. Many exagger... have been put out by the representatives of the poultry associations. T... recognized as exaggerations by those who follow the egg business, and when ... pointed out to Congress they should cease to be a factor in determining the ... of an equitable tariff. In the first place, it is our understanding that Congr... not wish to exclude or place an embargo upon the importation of articles wh... necessary to supply the raw materials used extensively in American manuf... and, in the second place, we believe that Congress desires to fix the tariff at such ... that some revenue may be derived.

In arriving at the relative cost of producing Chinese and American froze... following figures have been gathered by reconciling figures submitted by ... large importers of Chinese frozen eggs:

Additional cost of production in China.

	Cents per pound.
verhead[1]	1½
lditional cost of packing[2]	1
ınese export duty	½
ean freight	2
lditional freight charges in United States from Pacific coast to Atlantic coast	1¼
mger storage carry 3 to 4 months	¾
ecial hazards[3]	1
iendly preference of buyers for domestic stock	½
esent tariff on mixed eggs	2
Total[4]	10½

Thus it will be seen that with the present tariff of 2 cents per pound there is a itural advantage which domestic freezers of eggs enjoy, amounting to 10 cents per und and this has to be absorbed in the difference in price between American breakg stock and Chinese. At the present time (April) the raw breaking stock is selling roughout the Middle West, where the chief egg-freezing plants are located, at about cents per pound. Therefore, applying the above differential of 10 cents per pound this price would bring the necessary equalizing cost in China, under the present riff, to 5 cents per pound representing 1 dozen eggs. My information is that in ina eggs are now selling at 7 cents. Therefore under present conditions American oducers have an advantage of 2 cents per pound, and yet eggs must be frozen in ina to get sufficient supply for American bakers.

The market in China is influenced by the world market, for Japan, England, and her countries also buy eggs in China. Prices in the inland of China are very low, it the expense of getting eggs to sea coast is considerable. Therefore when prices e given in Consular Reports, etc., at 3 or 4 cents per dozen, it means at inland stations. mmissioner Benson's report (see Appendix 1) gives the price when he was there in 20 at 20 cents per dozen, but at the same time breaking stock in the United States is selling at 30 cents per pound representing 1 dozen eggs. This shows that the itural differential in favor of American freezers of eggs with the present tariff of 2 nts per pound was just equalized by the difference between the American cost and e cost in China.

The egg-freezing industry in America is nothing in comparison with the American ke baking industry. Very little labor is employed in breaking out and freezing gs, probably not more than one-fiftieth the number employed in cake baking, and yway it is impossible to expand the egg-freezing industry in America, because actically the entire supply of breaking stock is now consumed by the bakers and the supply of underpriced eggs shipped to the poorer residential centers of the ge cities.

There are no dried or powdered eggs produced in the United States, and therefore e protection of home industry does not enter in the question of tariff. Three and e-half pounds of raw eggs make 1 pound of dried or powdered eggs. The dehydratg process takes away much of the efficiency of the egg, and a pound of dried whole gs will perform the duty of only about 2½ pounds of raw eggs. Much more of the isture is evaporated from the albumen, or white of the egg, than from the yolk.

The dried albumen and dried yolk are to a great extent imported separately and ixed in the United States. The cost of performing the process of mixing in the nited States is about 2½ cents per pound. The present duty on dried albumen about 3 cents per pound, the same as under the Payne-Aldrich bill. The present ty on dried egg yolk is 10 per cent ad valorem, which amounts to about 4 or 5 nts per pound. The tariff bill that recently passed the House makes the rate 15 nts on all dried eggs, whether albumen, yolk, or mixed. This is an increase of 0 per cent on albumen and about 350 per cent on yolks. Of course under the esent tariff law shell eggs come in free, but based upon the relative efficiency of ied eggs to raw eggs, assuming the tariff on shell eggs the same as under the Payne-

[1] This includes extra salary required to send American supervisory help to China and keep them there d larger proportional number of supervisors required to superintend Chinese labor.

[2] Heavier tin cans for packing required for ocean transportation.

[3] Hazards due to silver market, contracts refrigerated space ocean shipments, military operations in ina, lack of public cold-storage facilities in China, danger of damage in transportation, selling part of e year's pack in next year's market, etc.

[4] The above does not include a differential in operating costs in favor of Chinese production on account cheaper labor amounting to about one-half cent per pound, and should be deducted from the above aking a total of 10 cents differential.

Aldrich bill, namely, 5 cents per dozen, the really equitable tariff on dried eg taking into consideration the cost of mixing in the United States, would be 12 cen per pound on dried albumen, 7 cents per pound on dried egg yolks, and 10 cents per pound on dried mixed eggs. Just at the present time powdered eggs are sellin in the United States at prices much less than the cost of production, like many oth food products. As there is no domestic dried-egg industry, no one is injured exce the importers, and the gainers are the bakers and the public consuming baker products. This, however, is an unusual condition and will adjust itself when t supply and demand become adjusted.

In the first place, let it be understood that the cake bakers of America care noth about shell eggs, and if Congress should see fit to impose a prohibitive tariff on sh eggs we do not think that it would be detrimental to the interests of the bake While many small bakers use shell eggs, we do not think that the exclusion of Ca dian, Australian, and Chinese shell eggs would influence the market. But we respectfully ask Congress to preserve the bakers' opportunity to supplement domestic supply by importation of frozen and dried eggs from China. Fact have been established in China by Americans to take care of American bak requirements, and to impose more than an equalizing tariff between the cost of mestic breaking stock (checked and cracked eggs) plus the cost of manufacture a transportation to the cake and pastry bakeries and the cost of manufacture of fro and dried eggs in China plus the cost of transportation to the American cake a pastry bakeries would work an irreparable damage to our industry. It would te to detract from the nutrition of bakers' cake and pastry, to the detriment of consumers, decrease output, and hence the number of persons employed, and crease revenue for the United States Treasury.

The farmers or egg producers would not be benefited by a prohibitive tari they do not sell breaking stock, and the chief beneficiaries would be the big Chic packing interests, which could command nearly the same price for breaking sto the market price of perfect shelled eggs.

Appendix 1.

[Extract of report of E. F. Benson, commissioner of agriculture, State of Washington, coverin China in 1920 to investigate Chinese egg importation.]

Through the efforts of the American consul at Shanghai and the courtesy of th manager of one of the factories I was given permission to inspect their plant, u the assurance that I was not making an "official inspection" but only a personal Much regret was expressed that this invitation could not include the other mem of our party. Probably the reason for such rigid secrecy is a desire to keep t processes of manufacture secret and prevent competitors from acquiring their meth This was unquestionably the reason in the factory I visited, for the manager s to me, "If it were not against the strict rules of this company I should like much to invite some Shanghai people to inspect our operations and see the cl and sanitary conditions here. As it is now I presume they think we are a fa putting out bad eggs in some camouflaged form so as to deceive the public. wish it were possible for me to show them just what we are doing."

Some of the care shown in this place to put out a clean and sanitary prod gests the dangers that may lie in the output of a less careful concern, and espe the small native factories.

1. The eggs are first candled and all bad ones are returned to the shipper a expense. A new idea to me; but why not penalize the seller of bad eggs or other bad product of farm or factory?

2. Of the 300 to 400 employees of this place, about one-half were girls. T 12 at each table broke the eggs—only two into one cup; so if one was bad only eggs were lost. Each girl looked at and smelled the eggs and passed the cup 1 girl at head of table, who judged the cup and dumped it into a big can holding 5 or 6 gallons. Then a higher inspector carefully examined and inspected before it was finally accepted.

3. The health and cleanliness of each of these girls is assured by a constant vision of factory employees and weekly examination by physician. To illu One table was called up for inspection. The girls lined up quickly and as I pas showed both sides of both hands and arms above elbows, opened their mouth showed their tongues and teeth, indicating that they were frequently called u go through this performance.

In an upstairs room, where some girls were sewing sacks, one girl was point as being one of the expert egg inspectors, but owing to a scratch on her hand she not work in the egg room. No one could work handling the eggs who had any

f the skin or a pimple or any indication of uncleanliness or unhealthfulness. The ınitary provisions, such as lavatories and toilets, were all that could be desired in ıy factory at home. I wonder if any native factories are that careful as to help and ļuipment. As to the other foreign factories, I have no information. These girls ork long days—10 or 12 hours—and receive "big wages," more than double the ages they could get elsewhere, in order that the factory should get the best help and ›ep them. These wages were $12 to $15 a month.

Egg prices now are 20 cents per dozen in Shanghai for fresh eggs. This unusually gh figure is because of the Japanese demand this year. At several retail stores I iced them and found the price generally 15 cents per dozen. At interior points, ıere shipping facilities do not bring them into competition with factory prices, eggs w sell at 5 cents per dozen—Shanghai dollar (silver). In our money that would w be a little less than 4 cents per dozen. So the factories are gradually raising the ice of eggs in China. At Hankow, the most important egg market in China, the erage price for eggs in 1919 was 7 to 10 cents per dozen (Mexican), laid down at the ctory wholesale.

APPENDIX 3.

[Quotations from an article published in the New York Produce Review and American Creamery, by Frank G. Urner, foremost egg statistician of America, under date of Apr. 6, 1921.]

TARIFF ON POULTRY AND EGGS—A CONSIDERATION OF CERTAIN STATEMENTS MADE IN THE PLEAS FOR HIGH IMPORT DUTIES.

A vast amount of labor has been expended by representatives of the poultry and egg producing interests of the United States in the collection of data bearing upon the industry for the purpose of preparation and dissemination of arguments for the imposition of high import duties on these products when imported from foreign countries. In considering some of the statements made as a basis for these arguments New York Produce Review does so solely in the interest of truth and without consideration, at this time, of the merits or demerits of the plea for tariff taxation for the benefit of the poultry industry or of the effectiveness of the means to the end sought. The Review believes that the consideration of the matter should be based upon facts and not upon fallacies, and regrets to find in the propaganda matter, and even in the briefs prepared for congressional use, some erroneous statements and unwarranted deductions.

Before taking up a consideration of these, attention may be called to rather a curious assumption of unity of interest, in respect to high import duties, among the States and Canadian membership of the American Poultry Association in a "Statement of the situation" issued by that body. In this, after enumerating important contributions by the association to the welfare of the poultry industry of the United States and Canada, it is stated that the association is now confronted with an equally important opportunity for promoting and protecting that industry in both countries by influencing legislation, in part to secure a tariff on poultry and eggs entering the United States from abroad. It would be interesting to know how the association can group together the interests of its Canadian and State membership in this way. It is true that we do not ordinarily import many eggs from Canada, as we did years ago before they were shut out by the McKinley tariff, as Canada's needs have grown faster than her production and she buys large quantities of eggs from us. But she does, at times, ship us a good deal of live poultry, and if it is deemed wise to shut this out by a suggested tax of 4 cents a pound the association might better undertake the propaganda frankly as regardless of its Canadian membership, rather than make the specious claim that it is done to "promote the poultry industry of the United States and Canada."

In a brief prepared by Arthur M. Geary, attorney for Pacific Cooperative Po... Producers, it is made to appear that egg markets in the eastern part of the United States were demoralized by the quantity of Chinese eggs sent to the Atlantic seaboard last winter after importation at Vancouver. Mention is made particularly of two shipments, one of 28 cars and one of 31 cars (a total of about 30,000 cases). In support of the declaration as to the demoralizing effect of these shipments press items are quoted from various parts of the country, reporting egg prices having fallen early in February to the lowest point for several years. Some of the statements quoted are erroneous, but it is a fact that egg prices have fallen this year, during the early part of the flush season, to a point lower than at any time since 1916, when the abnormal rise incident to the war began. The fallacy consists chiefly in attributing this fact to importations of Chinese or any other foreign eggs. As a matter of fact, the (approximately) 30,000 cases of Chinese eggs referred to (and a few thousand more) were scattered at various eastern markets, but at New York the total importations of shell eggs from China, Japan, and Argentina last January and February reached about 3... cases. During this period New York received and consumed nearly 800,000 cases of eggs in addition to about 135,000 cases of storage eggs carried over from 1920, so that the total quantity of foreign shell eggs received in the city during that time was only a little over 3½ per cent of the total and about the quantity needed for two days' average distribution. Moreover, the foreign eggs were nearly all of qualities that did not compete with any but undergrade storage stock, and to intimate that the radical decline in prices—which was really due to unusually heavy winter production of domestic eggs and to a general shrinkage of all food values—was the result of these comparatively trivial importations is evidently fallacious.

The brief says: "The shipments of Chinese eggs demoralize the eastern markets where the surplus of the eggs from the Pacific coast is marketed," and goes on to state that "the weekly sales of Pacific coast eggs in New York City amount, during this season of the year (February), to 15 to 25 carloads a week."

It is worth while, perhaps, to compare the addition to New York's egg supply from the Pacific coast with that from foreign countries. Only four years ago New York receipts from the Pacific coast were trifling; in January and February this year they amounted to 110,000 cases of high-grade eggs, competing for the best classes of trade

t Mr. Geary attributes to some 30,000 cases of foreign eggs received at New York ing this period the "demoralization" of values. But really it was not even the wth of supply from the Pacific coast in the New York market that led to the radi- y lower price levels; their total quantity in January and February was only about per cent of New York's supply. As a matter of fact, egg prices fell in all parts of country proportionately—or as nearly so as usual. New York, or any other sec- al market, can not be forced by importations or any other cause, except tempo- ly, below a parity with values at its chief sources of supply, and the total impor- ons of foreign shell eggs into the United States in January and February of this r could not have been more than a small fraction of 1 per cent of our national egg ply; the effect upon price levels must have been insignificant.

he brief of Mr. Geary devotes many figures to the cost of egg production on a typical mercial poultry farm in Oregon, arriving at a calculated average cost of 40 cents a en. If that is the true cost or an approximation of it, on the poultry farms of the ific coast which have grown to such importance during the past few years of rela- ly high prices, it will take more than an exclusion of foreign eggs to maintain a itable and substantial foundation for the development. In the period 1900 to 1916 latter year being the last before the United States entered the war, the highest age value of eggs at New York for any year was estimated at 26 cents a dozen in . The average value of fancy qualities, such as the product of specialized poultry s should be, was higher than that by perhaps 2 or 3 cents. But if the egg product iversified farming, which provides a very large majority of our egg supply—perhaps uch as 90 per cent of it—at a cost of production which, prior to the war, sustained an extent equal to the needs of the people without considerable importations at age annual wholesale prices in terminal markets ranging 26 cents downward, the ialized poultry farms will as we approach final readjustment of values find hard ding unless they can get their costs far below the present calculations, even if orts should be totally excluded.

he Review points out fallacious statements contained in "A Brief Favoring a ff on Eggs, Egg Products, and Poultry," by members of a subcommittee of the mittee on defense of the poultry industry of American Poultry Association, of ch committee Prof. James E. Rice, of the College of Agriculture at Ithaca, N. Y., airman.

n regard to paragraph 12 of the summary the statements do not agree with the evi- ce given by men experienced in the Chinese egg trade. Although it is true that na occupies practically the same degrees of latitude as the United States, we have r received any importations of Chinese shell eggs except those that left China in late fall and winter, reaching this country between December and early March. he statement that eggs are produced in China from "scavenger hens" is denied by men who have been in China and observed the matter. Hens are more or less avengers" anywhere if they are allowed to be.

TEMENT OF RALPH D. WARD, NEW YORK, N. Y., REPRESENTING WARD BAKING CO.

enator WALSH. Please state your full name.

Ir. WARD. Ralph D. Ward.

enator WALSH. What is your position with the Ward Baking Co.?

Ir. WARD. I am second vice president of the Ward Baking Co., r York City. Our product is bread and cake.

enator WALSH. Your company has many factories and is engaged that line of business?

Ir. WARD. Our company has 16 different factories and we are nufacturers of bread and cake. It is in relation to our cake busi- s that I desire to speak, with particular reference to the proposed ff on frozen eggs.

enator CALDER. Mr. Ward, please put into the record the different es where you manufacture.

Ir. WARD. I will do that. The Ward Baking Co. manufacturing nts are located in Boston, Providence, New York, Brooklyn, wark, Pittsburgh, Cleveland, Columbus, Baltimore, and Chicago.

With particular reference to the cake business, I desire to speak on the proposed tariff on imported eggs.

Senator WALSH. Your product is well known all over the East and distributed in all directions into every city and nearly all towns in the East daily?

Mr. WARD. I should say, Senator, to about 60 per cent of the population of the United States.

Senator WALSH. What is your output?

Mr. WARD. We produce in excess of 1,000,000 loaves of bread a day and at least a half million cakes a day on the average. That business fluctuates, but we are by far the largest manufacturers of cake in the world, of the particular kind of cake that we make, and we use a large part of the imported eggs that come into this country.

The CHAIRMAN. Mostly dried eggs?

Mr. WARD. No, sir; we do not use dried eggs. They are froz[en] eggs.

The CHAIRMAN. Where do these frozen eggs come from?

Mr. WARD. The frozen eggs come from China and United Stat[es] and the new tariff proposed an increase in the rate, which increa[se] has been suggested by the California association, upon the prese[nt] rate, of 2 cents to 8 cents per pound. This is excessive and reall[y] entirely uncalled for, because the frozen eggs imported from Chin[a] are not at all in competition with the shell eggs or the amount [of] frozen eggs handled in this country. The eggs that are frozen [in] China are prepared and refrigerated in establishments operated [by] Americans there. It is an American enterprise in China, a great[er] part of which, by the way, has been prompted through our sugg[es]tion and our cooperation with the American egg companies who ha[ve] gone to China and set up these very large factories.

Senator McCUMBER. What is the imported price of those eggs?

Mr. WARD. The imported price of those eggs is practically [the] same as the American price, about 25 cents a pound.

Senator McCUMBER. That makes about a dozen.

Mr. WARD. That makes about a dozen, 25 cents per dozen. T[he] American price is about the price of the Chinese egg, and the additi[on] of this tariff to the cost of Chinese eggs would practically wipe [out] China as a source of supply and would not be of benefit to the Amer[ican] market, because that will be absorbed by the packers of t[he] United States. That is proven by the fact that domestic a[nd] foreign eggs are kept at a price level. The eggs that come into th[is] country from China are just as perfect as American eggs, perhap[s] a trifle better, because they are packed from whole fresh eggs, wh[ile] the American frozen eggs come largely from eggs slightly crack[ed]. The packing houses lay aside those slightly cracked, so that if any[]thing the imported eggs are better, and you have a little mo[re] assurance that they are in perfect condition for the cake manu[]facturer. Cake has grown to be a staple product and not consider[ed] a luxury. Through the tremendous volume that we are able [to] handle we are able to give the public a cost price which makes [it] very attractive, and it has subtracted from the American housew[ife] in a big way a lot of domestic work and has relieved the women [of] a large burden, and so has created an industry which is well wor[thy of] recognition.

Now, we use frozen eggs exclusively in our manufacture. We o not decry other forms of eggs, but it is a more accurate and a ore certain ingredient than any other type of egg which we can se. If we were to endeavor to handle fresh eggs and cracked ggs there would be a great quantity of other ingredients spoiled rough musty and spoiled eggs, which can not be detected until ey actually get into the cake dough that is being mixed. As ou start the mixture going the musty egg is detected. In that way is method we have of using frozen eggs places that responsibility tirely on the manufacturers of frozen eggs and relieves us of at.

The total importation of eggs into the United States, which are sed exclusively by bakers, is less than 1 per cent of the egg production of the United States.

Senator CALDER. You are speaking now of frozen eggs?

Mr. WARD. Yes; of frozen eggs.

Senator McCUMBER. You mean, the importation of frozen eggs mounts to about 1 per cent of the frozen eggs produced in the nited States?

Mr. WARD. No. One per cent of all eggs laid in the United States. rozen eggs are not competitive with any other form of eggs in the ountry. They are used entirely by bakers and do not compete ith any fresh shell eggs.

In the California association, or any other representative body of roducers of eggs, they have places where they can send cracked ggs to be frozen and packed in American freezing establishments, ust as they do in China; but they are not able to supply the needs, nd freezing offers a means of preservation for eggs which are broken n the handling of them in the ordinary market in the United States y an American industry. So that this incoming of Chinese or other oreign imported eggs simply supplements a gap which has not yet een filled in the American industry, and it is not at all competitive ith ordinary eggs, because they are used entirely by baking establishments. In our own company we use about 9,000,000 pounds nnually, which naturally makes it a selfish interest; but aside from hat there is no real justifiable reason for the tariff proposed, so we trongly urge that the rates be maintained by making a 2-cent pecific rate. To raise the cost of imported frozen eggs by a tariff f 8 cents would shut out frozen eggs, and if the tariff were placed at cents per pound it would practically leave them where they are.

Frozen eggs which come into this country come from American nterprise in China, and there seems to be no reason at all that has ver been presented, as far as I can learn, why this duty should be aised.

Senator WALSH. I notice from the table furnished by the Tariff Commission that we export twenty times as many fresh eggs as we mport, and do not export any frozen eggs, which would bear out your statement that the domestic supply of frozen eggs is not ufficient.

Mr. WARD. That is correct. That is only about one-half of what we need.

Senator CALDER. What is the present price of frozen eggs?

Mr. WARD. The present price of frozen eggs is about 25 cents per pound.

Senator CALDER. How has that averaged up for the last two years?

Mr. WARD. That has averaged up pretty closely. I should say that was a pretty good average price. I have known the price to run below 20 cents, and I have seen the price when it was up to 40 cents, but I should say that was a fairly average price.

Senator CALDER. Is that what you are paying for them?

Mr. WARD. Yes; 25 cents a pound.

Senator CALDER. What is the price to-day of domestic frozen eggs?

Mr. WARD. The price of domestic frozen eggs is about the same. Those prices are kept exactly at a level. If there is an impost duty on foreign eggs coming into this country, the American industry will just absorb that difference, because it all goes into the Chicago packers. They have the industry in their control, and by adding this amount, you will add just that much to the selling price of American frozen eggs. The American public will not benefit at all, nor will the farmer.

Senator WALSH. Is the Chinese egg of superior food quality?

Mr. WARD. No. The Chinese egg is just the same as the American egg in content of proteïn and albumen.

Senator CALDER. Is it small or larger?

Mr. WARD. Perhaps a little smaller.

Senator CALDER. But not much?

Mr. WARD. Not much.

Senator SUTHERLAND. Do you prefer the Chinese egg on the ground of superior quality?

Mr. WARD. No, sir. Their qualities are just about the same as the qualities of the American egg.

Senator SUTHERLAND. I thought you said they were preferred.

Mr. WARD. I said they were largely preferred by us because in the Chinese egg-freezing establishment they use whole eggs, and in America they use cracked eggs. There is more certainty of a hundred per cent in the eggs coming from China.

Senator CALDER. Do I understand they are shelled and then frozen, shelled first or shelled afterwards?

Mr. WARD. The egg is first cracked and dropped into a receptacle, the white going into one part and the yolk passing into another part. The labor that does this gets very dextrous. The egg is inspected and if found all right is dropped into a receptacle where the eggs accumulate up to about 30 pounds, in some instances 35 or 40, but at the average 30, and during the time these eggs are being cracked the can into which they are put gets filled up to the top, it begins to freeze, and in a few hours that can is frozen completely and they are put in large refrigerating establishments in China, and then they are sent down on refrigerating barges to the harbors and put in ships and brought over here. In other words, that egg is frozen within an hour from the time it is cracked until it reaches here, and has retained every property of the original egg.

Senator CALDER. And it is kept in refrigerators until used?

Mr. WARD. Absolutely; it is in a frozen state until used.

I would like to submit a brief, which goes a little more into detail than I have had time to do here.

Senator MCCUMBER. All right.

3RIEF OF RALPH D. WARD, REPRESENTING WARD BAKING CO., NEW YORK, N. Y.

Cake is a staple food in the daily diet of more than 20,000,000 people, and the manu- acture of commercial cake has been largely developed in America in the past eight ears. The Ward Baking Co. is the largest manufacturer of cake in America and has ake bakeries in New York, Brooklyn, Chicago, Boston, Pittsburgh, Baltimore, leveland, and Newark.

The Ward Baking Co. began the manufacture of cake upon an extensive scale about ight years ago, and its production of cake has grown every year since that time. ur company has several million dollars invested in cake-baking plants and machinery nd we are vitally interested in this tariff on account of its effect upon our investments.

In former years the bakers had to rely upon shell eggs, and this was a great handicap, rst, by reason of the fact that the bakers could not rely upon the quality, as musty ggs would get into the dough before they were discovered and spoil the whole batch, us making a considerable waste. Then, too, when the baker has to rely on shell gs, he never knows what his cake is going to cost to manufacture, on account of the ct that eggs constitute the most costly ingredient in cake, and prices depend upon the se and fall of the market. For instance, if the baker had to rely on storage eggs at this me in the manufacture of cake, the price of cake would be much higher than it now . We sell a fine Ward's cake for your table at about 25 cents per pound, and we aintain that considering its nutritive value, with the possible exception of bread, it the very best food that so small an amount of money will buy. It is far from a xury. Its food value is determined by the amount of eggs, butter, sugar, and flour ed in making it, and you would not consider any of these as luxuries, nor could you nsider cake a luxury; it is an every-day household food.

We use frozen eggs exclusively in the manufacture of our cake. Some of this is ozen in the United States and some in China. That which is frozen in the United ates is prepared from checked and cracked eggs, which imperfections develop at the g-packing plant. Those frozen in China are made from the regular perfect-shell ozen eggs, which are brought in to the egg-freezing plant in Shanghai and frozen and epared under the most careful sanitary conditions, with American supervision. hese plants have weekly physical inspection of all employees by physicians.

When our cake business had begun to grow, about 1915 and 1916, H. J. Keith & ., of Boston, who had supplied a large part of our requirements from domestic eaking stock, informed us that there was getting to be a scarcity of these checked d cracked eggs in the United States for the manufacture of frozen eggs. We there- re realized that it would be to our advantage to lend our cooperation by buying rt of our requirements from the foreign packed frozen eggs to supplement the pply available in America. Accordingly the Keith Co. went to Shanghai and tablished an egg-freezing plant to care for a part of our requirements. Then, too, had to know from year to year about what our eggs were going to cost us, for the ason that we make our business plans considerably in advance, and the business ll not stand sudden changes in prices, etc. Our egg contracts are made in the ring and cover the egg requirements of our company for the coming year, there- e in this way we are able to calculate our costs for some time in advance.

It is my understanding that during the past season it was much more economical, en under the present tariff of 2 cents per pound, to manufacture frozen eggs in e United States than to manufacture and import them from China. We must have pply of breaking stock available in the United States supplemented by importa- n at a reasonable price. If the baker is to keep cake upon the market at a price which people will buy it, he must be able to get his frozen eggs at the price com- nded by checked and cracked eggs used in the manufacture of frozen eggs in the ited States. He can not sell low priced cake and pay high prices for eggs. There e not half enough eggs with damaged shells available from the egg-packing plants the United States to manufacture the frozen eggs used by bakers. A raise in the ty of frozen eggs means a raise in the price of cake, decreased production, and a crease in the employment of men.

The total importation of frozen eggs into the United States which is used exclusively the bakers is less than 1 per cent of the total egg production in the United States. e frozen egg is purely a baker's material and can not be used in competition with ell eggs. The importation of frozen eggs does not affect the price of shell eggs for e reason that frozen eggs and shell eggs do not compete. For instance, right at this ne when shell eggs are selling on the market as high as $1 a dozen, frozen eggs are lling as low as 25 cents. It takes a dozen of shell eggs to make a pound of frozen eggs. the baker had to rely upon shell eggs to-day, he would be out of business and unless u let the bakers supplement his supply of frozen eggs by importation, you are going make him pay such a price for his frozen eggs in America that it will kill the business.

People will pay only about so much for commercial cake and when you get above that price level they will not buy.

While it may be true that eggs have been selling very cheap in China early the past spring, during the breaking season, they were also selling at a low price in America at that time. In 1920 they were selling at 20 cents per dozen in China, but I understand that there is about 10 cents additional in the cost of packing and importing which has to be added to the China product on account of added costs of production and importation from China before you can compare the Chinese cost to the cost of production in America. Therefore, any addition to the present tariff of 2 cents will, I understand, shut out frozen eggs and in that way make the price of frozen eggs higher in America and decrease the manuafcture of cake. To be exact the present tariff is 1 cent per pound on frozen albumen and 10 per cent ad valorem on frozen yolks and 2 cents per pound on frozen mixed eggs.

The total importation of frozen eggs is about 18,000,000 pounds. Ward Baking Co. alone uses about 9,000,000 pounds per year, some of which are frozen in America and some abroad.

Therefore, gentlemen, I wish to ask you in the interest of the cake baking industry to allow the tariff on frozen eggs to be placed at 2 cents per pound, which is somewhat higher on the whole than the present rate but very much lower than is being asked by the California Poultry Association. We hope that this committee will not be influenced by extravagant statements of the poultry association which do not realize that frozen eggs do not compete with shell eggs.

STATEMENT OF C. E. RICHARDSON, WASHINGTON, D. C., REPRESENTING DEALERS IN FROZEN AND DRIED EGGS.

Senator McCumber. Please state whom you represent.

Mr. Richardson. Mr. Chairman, I represent the dealers in frozen and dried eggs in the United States.

Senator McLean. We went all over that this morning. Was not that gentleman who spoke speaking for your industry?

Senator McCumber. He spoke for the other side.

Mr. Richardson. He spoke for the bakers.

Senator McCumber. He covered that all very thoroughly, but I understand Mr. Richardson will be very brief.

Mr. Richardson. Yes; I will be very brief. It is assumed with us you will in your next tariff bill put a duty upon shell eggs, and it is upon that assumption that we are recommending certain rates which the traffic will bear. We are not asking for a reduction of the present rate, but we are asking that a rate of 7 cents a pound be put upon dried eggs, and all the component parts, including yolks and albumen, each, and 2 cents a pound on frozen eggs, and all their component parts, and that means a little increase over the present rate where the different parts are separated.

The rates, however, in the Fordney bill, are 50 per cent to 400 per cent increases over the Underwood bill rate. The western bloc rates, the rates recommended by the witnesses of the so-called western bloc recently, are from 140 to 700 per cent increases over the present rates, and that would make the importation of frozen and dried eggs absolutely prohibitive.

Senator Watson. You represent the importers?

Mr. Richardson. Yes, sir. The business of providing frozen and dried eggs is not strictly competitive. Those products do not compete with the shell egg of the domestic producer, because they are sold only to manufacturers of cakes and pastry and such things. The frozen eggs go largely into cake, and the dried eggs are used in pie and in some kinds of confectionery. They have not displaced the local product of shell eggs, the domestic eggs, because they have

nply gone into manufactures as raw material and have permitted e bakers to increase their line of industry, and to that extent they rved to make cake and pastry cheaper and to provide the consumer th what was formerly considered a luxury but has now beme a necessity. This increase of production has of course been of l to American labor and has resulted in the employment of a great any more men and women and automobiles and horses. These oducts are not sold even in the same market as shell eggs. They ve different channels of trade. They are sold directly to the conmer, the manufacturer, as a raw material, and they do not go to the market.

Senator WALSH. If they did not import frozen eggs would they t have to use the shell eggs?

Mr. RICHARDSON. They could not.

Senator WALSH. Why?

Mr. RICHARDSON. I will reach that, Senator, in just a minute. In ct, the tremendous present bake-shop industry is due to the imrtation of frozen and dried eggs into this country, and it has eated an industry that did not exist before. These products are sential for bakers, first, because the quality is uniform. It is the me the year round. The supply is uniform. The baker knows at he can get his eggs whenever he requires them. He has a conact which is made annually, and he knows to an absolute certainty at that supply is ready for him and at a uniform price that is made e year round. It is not affected by the ordinary fluctuations, and fact, it does not fluctuate much from year to year.

The bakers require these goods because of their convenience. As r. Ward said this morning, they could not conveniently have a partment established for breaking out these eggs. I heard Mr. ard's father say before a congressional committee a year ago that would be impossible for them to establish such a department as rt of their business, because it would mean so much detail that ey simply could not give it attention.

The establishments where this is done are ventilated by fans, so at if they ever run across a poor egg the entire establishment is ickly and thoroughly ventilated, and every implement that has en used in that respect, or in the establishment, which has come contact with even a musty egg, is immediately sterilized, and the nerican baker can not have any such establishment as that. If could not get the frozen eggs and the dried eggs at a reasonable te, he would simply have to reduce his output and deprive conmers of the cakes and pies to which they have become accustomed. e would simply have to draw in this line of his business and cut it certain features which are now very important.

In closing, Mr. Chairman, I would like to suggest that any tariff at is put upon these commodities should be exclusive of the coniners. Frozen eggs come in tin cans, American made, and before ie contents are removed the cans are destroyed for any other use. he top is cut off, because those eggs are frozen solid.

The dried eggs come in wooden boxes that are tin lined, and the n lining is made in the United States, and that lining has to be stroyed before the contents can be used.

One thing more is that it should be a specific duty, because in nporting these articles from the Orient it is difficult to establish the

value in the country of origin. That has led to a good deal of injustice. There is one other point, that all the parts of the egg should be at the same rate of duty. Otherwise it is possible for unprincipled importers to import goods called yolks of eggs, and still have them accompanied by enough albumen so that they can be placed in the market as entire eggs, which is an imposition upon people who would like to conduct an honorable business and could not compete with that sort of thing.

Senator WALSH. Have you prepared an amendment showing what you want? Perhaps that would be more likely to get results.

Mr. RICHARDSON. I shall do that in my brief.

Senator McLEAN. I read in the newspaper the other day that these dried eggs were unwholesome; that dried eggs imported from China were unwholesome, because in the drying process some metal was used, and that the egg absorbed some metallic substance. There was a very long article in the newspaper, condemning dried eggs imported from China.

Mr. RICHARDSON. I doubt if that can be substantiated in any way, because those eggs are inspected by United States inspectors on entry for importation, and they are given absolute care in the process of evaporation. The Department of Agriculture has expressed itself frequently as being entirely satisfied with the quality.

STATEMENT OF THE NATIONAL BAKERS' EGG CO., NEW YORK CITY.

The present import duties upon the products under consideration are as follows: Evaporated egg whites, or albumen, 3 per cent per pound; evaporated egg yolks, 10 per cent ad valorem; evaporated eggs, 10 per cent per pound. The bill now under consideration proposes a straight tax of 15 per cent per pound on any of these products.

Eggs in the shell are not at present taxed; and unless a tariff duty is levied on that commodity it would be unjust and inconsistent to ask producers of the evaporated product to pay. If, however, it is the will of Congress to tax imports of eggs of all kinds, we have the honor to recommend the following amendment:

Paragraph 713, line 5, strike out "15 cents per pound" and substitute "7 cents per pound net." This will increase the revenue from whites and yolks, although slightly decreasing that from the entire eggs, but it is a very fair compromise of the three. It will increase the revenue, while it will also prevent the evasions whereby the Government has been tricked under the present law.

It is difficult to understand why such a wide distinction has been heretofore made between the egg and its component parts. An egg is made up of equal parts of white and yolk, and their separation does not change their nature nor their relation to commerce. In preparing the yolk it is a physical impossibility to rid it entirely of albumen, and it is, of course, possible to allow more and more of the albumen to adhere to the yolk, so that nearly the entire egg can be imported as yolk, and the Government is thereby defrauded of revenue, while honest importers are handicapped by unprincipled competitors.

It was stated before your committee by Mr. Harry Lewis, November 10, 1921, that the dried-egg industry in this country has been ruined by the importation of Chinese eggs in various forms. This, however, is misleading, for the cause was not as stated. As a matter of fact, meat packers of this country practically control the entire situation, even to the prices obtained by American farmers. There was one evaporating establishment in this country, but the packers' control became so absolute that the concern discontinued its operations. However, our company is able to secure and to furnish the evaporated product to American consumers at prices low enough to enable them to increase the volume of goods manufactured without perceptibly affecting the local market for domestic shell eggs. Our trade is, therefore, supplied with wholesome materials for their industry without interference from the so-called "meat trust." A high tariff duty on evaporated eggs would not help the farmer, but it would help the meat packer. A reasonable tariff will permit us to remain in business; it will at least reduce the packer control to a point where competition

possible. The alternative would prohibit further importations, and leave the manu-:turing bakers and the consuming public more than ever at the mercy of the packers.

Testimony offered before your committee November 10 contained slurring refer-ces to the quality of evaporated foreign eggs? As is well known to every member Congress and the entire reading public, it is impossible to import foodstuffs into is country without thorough inspection and a certificate from the Department of riculture, giving abundant assurance that the imported commodity strictly con-ms to the high standards of excellence required in this country. This should solutely refute such scurrilous insinuations, without further argument; but we uld present facts in detail if it were necessary.

The Fordney bill now pending seeks to increase the rate on dried whole egg 50 r cent, on yolks nearly 400 per cent, and on whites 500 per cent. We believe :h increases are without the slightest justification. The need of revenue is recog-:ed, and we believe that our proposed amendment will yield more income than it proposed by the Ways and Means Committee. As hereinbefore stated, our oposed advance in rates on whites and yolks justifies the small reduction on whole s, and the uniform specific rate will simplify the administering of the law.

There can be no advantage gained by a reckless increase of import duties on raw iterials used in American manufactures of food products. It is shown by the itimony of Mr. Ward and of Mr. Richardson, submitted to your committee on De-mber 13, that evaporated eggs and frozen eggs are not sold in the ordinary channels trade and that they are noncompetitive with American products. Excessive ties on these commodities can only result in the advance of prices to be paid by the nsumer to the trust, without any corresponding advantage to the farmer; and the tes proposed by some of the interested parties before your committee November 10 uld destroy the entire industry of which we are a part and eliminate all revenue m this source, besides depriving the public of this defense against extortionate ices now afforded (in a measure) by imported eggs.

As an aid to American industry the evaporated egg has performed a valuable serv-e, and can further serve in that capacity by furnishing work for American hands d in the extension of American enterprise. Evaporated eggs are used by bakers d confectioners in making pies and some types of candy. So dependent are these nufacturers upon this product that many of them would be put out of business if e supply were withdrawn. The supply is uniform, the quality always perfect, d the price subject to little or no fluctuation. Were our customers obliged to pend upon domestic shell eggs many of their lines would have to be abandoned, eir business would be seriously hampered, and the quality of their products would unhappily changed. Most of us can still remember the time when, before evap-ited eggs were in the market, many of the bakers' products tasted principally of sty eggs and had to be overseasoned with sugar, vanilla, nutmeg, and other condi-ints to disguise the unavoidable consequences of using eggs drawn from the ordinary urces.

The evaporated-egg products to which this discussion relates are produced ex-sively in foreign countries and form a part of that commerce which the United ites is striving to build up with China. It is especially desirable that our commerce uld draw from China as many as possible of the noncompetitive commodities in change for the big trade that we hope to enjoy in the Chinese market.

As to classification, we would recommend that "dried egg albumen" be eliminated m Schedule 1 or given the same rate as in Schedule 7, for it is identical with what known as "whites of eggs." As to the administrative features, we believe that only cific duties should be placed on egg products. The foreign value of these commod-es can only be approximated, no fair basis for an ad valorem duty being available. ud and deceit are very possible under an ad valorem duty, and they have undoubt-ly been practiced in the past.

TATEMENT OF THE JOHN LAYTON CO. (INC.), NEW YORK, N. Y.

We are engaged in the business of importing frozen eggs, frozen egg yolk, and frozen g albumen.

Eggs in the shell are admitted duty free, but the following duties are imposed upon en-egg products: Frozen eggs, 2 cents per pound, plus weight of container; frozen g yolk 10 per cent ad valorem; frozen egg albumen, 1 cent per pound.

The bill now pending before your committee proposes a duty of 4 cents per pound all three of these products, including the container. We have the honor to recom-nd that this bill be amended as follows: Strike out of paragraph 713 "4 cents per und," and substitute "2 cents per pound net."

This recommendation is offered under the assumption that a duty will be laid upon shell eggs; but, otherwise, frozen eggs should be admitted free, as the latter, being raw material for use in manufactures, have a better claim to a place on the free list than the shell eeggs which actually compete with the domestic product. We ask that any rate imposed be upon the net pound, because the containers are usually material exported from the United States, and they have to be destroyed in order to remove the contents.

The present duty of 10 per cent ad valorem upon egg yolks is incongruous, as its value, upon which to base an ad valorem duty, is problematical, and any such law might lead to innocent undervaluation or invite fraudulent misrepresentation. It is needless to remind your committee that the penalty is practically the same in either case. In addition to that, we submit that egg yolk is a part of an egg and should be treated the same. The proportions of white and yolk in an entire egg are approximately 50–50.

Egg whites, or albumen, now taxed at 1 cent per pound, should also be rated the same as the entire egg, as its source, preparation, shipment, and sale are in no way different from the mixed ingredients. Further, it is pointed out, it is possible to include much of the albumen with the commodity imported as yolks, and to thereby violate the spirit of the law. Hence a specific rate of duty upon net weights of all three of the egg products is recommended as a just requirement, as a preventive of fraud, and as a safeguard against innocent error; provided, of course, that shell eggs are also taxed.

The rate proposed by the Ways and Means Committee of 4 cents per pound on all three classes of egg products would mean an advance of 100 to 300 per cent; and if allowed to stand will seriously curtail the importation and sale of these commodities and result in reduced revenues to the Government, with unnecessarily increased cost to the baking industry.

The witnesses produced by the so-called "western bloc" asked for a rate of [illegible] per pound on each of the three classes. We have no hesitation in saying that this rate would be absolutely prohibitive and would stop all importations of these commodities into the United States, as well as eliminate all revenue to the Government from this source. It would also curtail much of the present baking industry in the United States and seriously affect the quality of many products of that trade. Reference is made to the testimony before your committee of Messrs. George Ward and C. E. Richardson as to the necessity for frozen-egg products in the manufacture of certain commodities which have become necessary articles of American diet.

There appeared before your committee a gentleman from the Petaluma Association who quoted a report from Paris that Chinese eggs are not suitable articles of [illegible]. We take the liberty of quoting below an article which appeared in the October number of Health Notes (London), published by the Institute of Hygiene, which absolutely refutes the slanders that have from time to time been industriously circulated by interested parties, as follows:

"FROZEN EGGS AND THEIR CHARACTER.

"A statement, originating from Paris, has been circulated throughout France, where protective interests are very strong, that Chinese eggs, which are imported into Europe packed in kegs and in a frozen condition, are dangerous and contain large numbers of bacteria. The statement has appeared in English journals under such alarming headlines as '36,000 microbes in a spoonful,' and is evidently calculated to deal a mortal blow to European importers of frozen eggs and thereby benefit local farmers. Frozen eggs are used to such a large extent in industry, in the making of cakes and biscuits, that it would have been a very serious matter, indeed, from a public health point of view had it been proved correct that they are harmful. We have recently, however, conducted a very careful and stringent bacteriological examination of Chinese frozen eggs and, for the purpose of comparison, examined ordinary shop-sold 'new laid' eggs simultaneously and on the same lines. The new-laid eggs were [illegible] of good size, and are classed in the trade as first grade. The results of our examinations proved without the possibility of doubt that the frozen eggs were not only as good as the new laid, but were actually very much freer from bacteria when opened and even up to 24 hours after opening. It is, perhaps, not usually appreciated that eggshells are porous, permitting of the passage of bacteria. Figures in bacteriology, also, do not mean much to the man in the street, but just a few details of our comparative examination will indicate the nature of the results. The frozen eggs [illegible] opened in a room temperature of 20° C. contained 5,200 bacteria per gram, while the initial number in the new-laid eggs was 4,200,000. After 24 hours the frozen eggs contained 830,000, while the new laid contained 48,000,000 bacteria per gram [illegible]

emperature of 37° C. the results were equally satisfactory and likewise in favor of the rozen eggs. A number of bacteria in eggs are probably rendered ineffective during he process of baking. In any case, however, we have proved that the statement sued from France is altogether unreliable and misleading, and that frozen eggs are ot only safer to use than commercial eggs, but safer, also, than guaranteed new-laid ggs bought in the open market.

As a further guaranty of the purity of our products, we beg to call attention to the ict that all eggs and egg products imported into the United States are inspected and assed by the Department of Agriculture before being allowed to go into interstate ommerce.

Egg products imported by us and our competitors are of the highest grade; they re prepared from selected eggs, scientifically graded by operatives who have been killfully trained in the work. These products have been in use by the largest and est bakers in the United States for the 12 years last past.

A very large portion of the entire baking industry relies upon the imported egg roducts, which are better adapted to bakery uses than shell eggs. They are safer, ore convenient for use, and of unvarying high quality; the supply is regular at all mes of the year, and the price is less susceptible of fluctuation than in the case of hell eggs.

This commodity not only furnishes bakers a ready-to-use material for use in manu- cturing, but it leads to the production of larger quantities and numerous varieties f cakes, which are sold at popular prices to people of all classes, some of whom were eprived of this luxury before the frozen-egg industry brought cake into its present eneral circulation.

Not only does the imported frozen egg aid in furnishing employment in a com- endable industry, but it releases for table use the shell egg of domestic origin ithout unduly depressing or enhancing the price of the latter.

The bakers in the large commercial centers are the sole users of imported frozen ggs, and the growth in the use of that commodity in this country has been marked y an active extension of the bakery business, whereby more men, women, horses, nd trucks are employed; and we are justified in believing that we are constructively iding American industry without any of the compensatory national losses that usually ccrue to the importation of a competitive product.

This brings us to the question of competition, upon which import duties often epend. Our prices are more nearly level than are those of the domestic produce ealer, and as they are at some periods of the year above those of shell eggs and wer at other times, the question of competition is not considerable. At any rate, t will be observed that, while the use of frozen eggs has been on the increase for the ast year or two, and the importation has necessarily increased, the value and cost f domestic shell eggs have not been visibly affected thereby.

The only suggestions that we can offer as to changes in the phraseology or administra- on of the law have already been made, i. e., that all three of the frozen-egg products e given the same rating, and that a net rate of specific duty be substituted for all d valorem adjustments now required.

BLACK AND SILVER FOXES.

[Paragraphs 715 and 1507.]

TATEMENT OF F. E. MUZZY, REPRESENTING LIVE SILVER AND BLACK FOX GROWING INDUSTRY, SPRINGFIELD, MASS.

Senator Walsh. What is your business?

Mr. Muzzy. Fur farming.

Senator Walsh. You were not heard before the Ways and Means Committee of the House?

Mr. Muzzy. No, sir; I think I am the only one to report on para- raph 715, although we could have had seventy times seven, and I could alk to you seven hours if you had the time and the patience. But if ou will give me seven minutes to supplement a brief which I have repared, which is very clear and short, I would appreciate it.

Senator Walsh. Proceed.

Senator La Follette. You will get the time.

Mr. Muzzy. Inasmuch as high-quality breeding stock, such as horses, cattle, sheep, swine, etc., have been admitted into this country free of duty for many years, the fox raisers did not for a moment think the silver black or the black foxes would be made an exception of, hence did not appear before the House committee as a body when this section of the tariff was under consideration.

A very few, through ignorance or misrepresentation, presented data to the House committee which was so warped, and not denied that the subcommittee proposed a duty of $350 per head on all foxes imported into this country.

Senator McCumber. Will you explain why they assessed such an enormous figure on the poor little fox?

Senator La Follette. Possibly in the interest of another fox.

Mr. Muzzy. Yes, sir; because of a very few who wanted to fix the price so high, and there is a scarcity of foxes in this country—they are raised in captivity, you know; it is the captive fox—that it would stimulate the price of their own raising, $350 per fox or $700 a pair.

Senator Walsh. I think if you will allow him to proceed with his statement——

Mr. Muzzy. I have that all covered here.

Senator McCumber. I had not noticed that big figure before, and it was surprising to me.

Senator Walsh. Silver foxes are luxuries.

Mr. Muzzy. Among the statements made was that Canada imposed a duty of 25 per cent on all foxes shipped from this country into Canada, while it is a fact no duty is or ever has been required, but foxes can be shipped from the United States into Canada free of duty.

They also stated that 90 per cent of the fox breeders in the United States were in favor of this duty, and I honestly believe that 75 per cent of the fox breeders of the United States do not want the present tariff disturbed—it is to-day 10 per cent ad valorem.

What the honest and up-to-date fox breeders want is to improve the quality of the present stock and be permitted to procure high quality breeding stock for breeding purposes and prohibit the importation of inferior stock for breeders.

Senator Smoot. What do you pay for silver foxes?

Mr. Muzzy. They range all the way from $500 a pair—they sell in pairs—up to $3,000 a pair, according to quality, just as cattle. You buy a cow according to quality. The average price is about a thousand dollars a pair.

There are two fox breeders' associations in the United States, one at Boston and one at Muskegon, Mich. I belong to them both and never heard anything of the proposed tariff until too late to appear before the House committee, hence my request to appear before you to-day.

A very few fox men got together and to serve their own selfish interests thought a $700 per pair duty on foxes would enhance the value of their stock, some of which is of a very inferior quality, and shut out Canadian importation.

Senator Walsh. What do you mean by "foxes"?

Mr. Muzzy. Foxes for breeders. All honest leading fox breeders know and admit that Canada has, as a whole, very much superior animals to those in the United States. Take, for instance, Prince

Edward Island, Canada. They have been raising silver foxes in aptivity on this island for some 30 years, have been culling out the oorer animals until they have to-day the best average quality of ilver foxes of any group of ranchers of the world.

In the United States it is an infant industry, and to bring up the uality of the American foxes it is necessary to improve quality reeders and these are needed in the United States to-day.

Foxes are raised for their pelts, which sell all the way from $100 to 1,000 per pelt. It costs practically as much to raise and feed the 100 pelt fox as it does the $500 or the $1,000 pelt fox, and it is the quality" fox that the American wants, and why give this growing idustry a knock-out blow in its infancy?

As to the revenue for the Government, the quality of foxes imported r exported will never cut any figure. As statistics show, approxiiately 1,000 foxes were imported in 1920, on which a duty of 10 per ent was paid.

Three hundred and fifty dollars duty per fox would cut the imporition down to not over 200 animals, which would mean not to xceed $70,000 revenue.

They are not a prolific animal, and the records on Prince Edward sland show for the past five years an average of a trifle less than two ups growing to maturity per pair foxes for the year.

What the leading fox men of this country want to-day is to amalamate the two associations into one organization and unite with anada on a standard that will be accepted by both Governments, nd admit high quality animals for breeding and show purposes free f duty, and this can and will be done if you do not disturb the present ariff and allow the fox men to work out their own salvation, which hey will do if you let them alone, and not handicap the majority by cting on the request of a very small minority.

There is not enough quality stock in the United States to supply the emand for breeding purposes. Canada had this needed stock of igh quality breeders, and to put a high tariff on the importation of reeding stock will give a knock-out blow to a young and fast-growing idustry that we should encourage and not discourage, for a raise of uty would prevent the prospective rancher from going into business nd only temporarily help a few to the disadvantage of the many.

There is not a surplus of foxes in the United States and Canada at he present time. If they were all pelted, the pelts would not glut he markets of the world, hence I beg of you not to do this industry an njustice and seriously injure it when it is just getting on a healthy oundation in the United States, and it would not add to our revenue.

The worst feature of the whole subject is paragraph 1507, which dmits all breeding stock into the United States free of duty "except lack or silver foxes."

The Bureau of Animal Industry has put into effect a quarantine rder which prevents unhealthy or diseased foxes from coming into ur country. They can also put restrictions on the importation of nferior animals, as Canada now has a fox studbook, and the honest ox breeders of both the United States and Canada are anxious to have ealthy quality foxes given free access to and from both countries.

There are to-day many prospective ranchers who want to enter this ew industry in the States of Pennsylvania, Ohio, Wisconsin, Michi-

gan, and Illinois, as well as all the northern States, such as Minnesota. North Dakota, Montana, Idaho, Washington, and Oregon.

In this proposed bill, paragraph 715 discourages them and paragraph 1507 would absolutely prohibit the importation of breeding foxes and handicap the new rancher from starting in this new business.

Paragraph 1507 makes a specific exception of silver-black foxes which means an embargo on the importing of even high-grade quality foxes which we so badly need to-day.

Senator SMOOT. You only import breeding stock?

Mr. MUZZY. Only import breeding stock.

Senator SMOOT. What you want is in paragraph 1507, on page 174 the exceptions taken out of that paragraph?

Mr. MUZZY. That is all.

Senator SMOOT. So as to strike out "except black or silver foxes!"

Mr. MUZZY. Yes.

Senator SMOOT. In other words, to come in here free under the law, but the exception is made in paragraph 1507 of "black or silver foxes," and that is what you want stricken out?

Mr. MUZZY. Paragraph 715 discourages them and paragraph 1507 would absolutely make a specific exception.

Senator SMOOT. That is what I said.

Senator LA FOLLETTE. These words were slipped in?

Senator SMOOT. That is what you want out?

Mr. MUZZY. Yes. As paragraph 716 raises the duty on foxes from 10 per cent ad valorem to 15 per cent ad valorem or an advance of 50 per cent, this advance should be sufficient to satisfy the most radical. Hence I beg of you to cut out paragraph 715 entirely and eliminate from paragraph 1507 the words "except black and silver foxes," as the Bureau of Animal Industry have already placed ample protection against the importing of inferior foxes.

Senator WALSH. And eliminate the paragraph?

Mr. MUZZY. Eliminate the words "silver and black foxes."

Senator McCUMBER. Then why should we have a tariff at all on foxes that are imported for breeding purposes any more than we should on cattle and horses; and those animals have all been free for the purpose of improving our stock?

Mr. MUZZY. That is just our position.

Senator McCUMBER. I can not quite understand, then, why we should follow a practice so different in the matter of improving the character of our stock of foxes.

Senator SMOOT. You do not mean to say that you want foxes to come in here free?

Mr. MUZZY. Yes, sir.

Senator SMOOT. You want breeding foxes, but you do not want the general foxes?

Mr. MUZZY. Oh, no; I want them for breeding purposes.

Senator SMOOT. Then you do not want to strike out 715; 15 per cent ad valorem would fall in that paragraph.

Mr. MUZZEY. We want 715 cut out entirely and 1507 cut out where it excepts from all other animals silver and black foxes?

Senator WALSH. How many foxes are brought in a year?

Mr. MUZZY. About 1,000 were brought in last year.

Senator WALSH. For pelts?

Mr. MUZZY. For breeding purposes.

Senator WATSON. Where is this industry located?

Mr. MUZZY. It extends all over the northern part of the United tates. Michigan is one having the most ranches of any State of he Union. All northern States have them. It is a young, growing ıdustry, and they are raising the foxes in captivity. The demand for ıem has increased ever since I remember and the supply is on the ecrease.

Senator MCLEAN. What is the tariff on the pelts?

Mr. MUZZY. There is no tariff on raw furs.

Senator WATSON. Those foxes are kept in captivity?

Mr. MUZZY. In captivity entirely. I beg to submit a digest of ıriff of 1913 and 1921 applying to foxes, with comparison. I would ke also to submit copy of letter from James S. Hanson, president the Hanson Silver Fox Co., of Penacook, N. H., submitted to the ıbcommittee of the House on Ways and Means; also my letter to on. W. C. Hawley, chairman of the subcommittee of the Com- ittee on Ways and Means, indorsing Mr. Hanson's letter.

Mr. C. T. Dryz, of Eagle River, Wis., a large fox breeder of Wisconsin ıd a director of the National Fox Breeders' Association, of Muskegon, ich., was to appear before you to-day, but was unavoidably detained, ıd has requested that I submit his brief, which especially refers to ıragraphs 715 and 1507.

(The matter above referred to follows:)

ARIFF ACT 1913 (H. R. 3321) AND TARIFF ACT 1921 (H. R. 7456), APPLICABLE TO FOXES IMPORTED FROM CANADA.

TARIFF ACT OF OCTOBER 3, 1913.

Schedule G.—Dutiable list.—PAR. 187. All live animals not specially provided for this section, 10 per centum ad valorem.

Schedule G.—Free list.—PAR. 397. Any animal imported by a citizen of the United ates, specially for breeding purposes, shall be admitted free, whether intended to be ed by the importer himself or for sale for such purposes: *Provided*, etc.

PAR. 398. Animals brought into the United States temporarily for a period not ceeding six months, for the purpose of breeding, exhibition, or competition for izes offered by any agricultural, polo, or racing association, etc.

NEW TARIFF ACT, 1921 (H. R. 7456).

Schedule 7.—Dutiable list.—PAR. 715. Black or silver foxes, $350 per head.

PAR. 716. Live animals, vertebrate and invertebrate, not specially provided for, 15 r centum ad valorem.

Schedule 7.—Free list.—PAR. 1507. Any animal imported by a citizen of the United ates specially for breeding purposes, shall be admitted free, whether intended to be ed by the importer himself or for sale for such purposes, except black or silver foxes: *ovided*, etc.

PAR. 1508. Animals brought into the United States temporarily for a period not ceeding six months, for the purpose of breeding, exhibition, for competition for izes, etc.

COMPARISON.

Paragraph 715 of the new tariff act (H. R. 7456), placing a duty of $350 per head on ack or silver foxes, is entirely new and is practically prohibitive as to foxes imported om Canada.

Paragraph 716 of the new tariff act (H. R. 7456) corresponds to paragraph 187 of e tariff act of October 3, 1913, except that it makes the rate of duty 15 per cent ad lorem instead of 10 per cent ad valorem, an increase of 50 per cent in the duty on ive animals not specially provided for."

Paragraph 1507 of the new tariff act (H. R. 7456) corresponds exactly to paragraph 7 of the tariff act of October 3, 1913, except that after the word "purposes" in the rth line of said paragraph 397 the words "except black or silver foxes" are inserted.

Paragraph 398 of the tariff act of October 3, 1913, is copied exactly in paragrap 1508 of the new tariff act (H. R. 7456), and refers to animals imported for show purpo

SUGGESTED CHANGES.

(1) In paragraph 715 (H. R. 7456), Senate bill, July 27, 1921, change the amount of the duty from "$350" to "$200."

(2) In paragraph 1507 (H. R. 7456), Senate bill, July 27, 1921, cut out the words "except black or silver foxes" in lines 22 and 23, page 174, leaving the paragraph exactly the same as paragraph 397 of the act of October 3, 1913, which provides for the free importation of high-bred, registered animals for breeding purposes.

FREE LIST, TARIFF ACT OF OCTOBER 3, 1913.

PAR. 397. Any animal imported by a citizen of the United States, specially for breeding purposes, shall be admitted free, whether intended to be used by the importer himself or for sale for such purposes: *Provided*, That no such animal shall be admitted free unless pure-bred of a recognized breed, and duly registered in a book of record recognized by the Secretary of Agriculture for that breed: *And provided further*, That the certificate of such record and pedigree of such animal shall be produced and submitted to the Department of Agriculture, duly authenticated by the proper custodian of such book of record, together with an affidavit of the owner, agent, or importer that the animal imported is the identical animal described in said certificate of record and pedigree. The Secretary of Agriculture may prescribe such regulations as may be required for determining the purity of breeding and the identity of such animal: *And provided further*, That the collectors of customs shall require a certificate from the Department of Agriculture stating that such animal is pure-bred of a recognized breed and duly registered in a book of record recognized by the Secretary of Agriculture for that breed.

The Secretary of the Treasury may prescribe such additional regulations as may be required for the strict enforcement of this provision.

Horses, mules, and asses straying across the boundary line into any foreign country, or driven across such boundary line by the owner for temporary pasturage purposes only, together with their offspring, shall be dutiable unless brought back to the United States within six months, in which case they shall be free of duty, under regulations to be prescribed by the Secretary of the Treasury: *And provided further*, That the provisions of this act shall apply to all such animals as have been imported and are in quarantine or otherwise in the custody of customs or other officers of the United States at the date of the taking effect of this act.

PENACOOK, N. H., *July 7, 19..*

Hon. W. C. HAWLEY,
Chairman Subcommittee on Schedule G,
Committee on Ways and Means, House of Representatives, Washington, D. C.

SIR: There has just come to our notice a copy of a brief submitted to you by A. L. Williams, of Muskegon Mich., on behalf of the National Silver Fox Breeders' Association of America, and Mr. J. S. Sterling, of Plattsburg, N. Y., on behalf of the American Fox Breeders' Association, of Boston, Mass., in which is advocated a special duty of $350 per head on black or silver foxes coming into this country from Canada or other foreign countries.

We desire to take issue with a number of the statements set forth in said brief and to call your attention to the fact that, in our opinion, a most unjust and discriminating tariff is proposed and one that, instead of helping the fox industry in the United States, will do said industry a great injury and have the effect of retarding its development very materially.

MAJORITY OF FOX BREEDERS AGAINST DUTY.

First. We deny the statement that "95 per cent of all the progressive silver fox breeders of the United States" are in favor of the excessive duty proposed; and we assert that a very small proportion of said breeders are in favor of such a duty, that very few of them knew that their associations were recommending to Congress such duty, and that said duty had not been fully discussed.

CANADA CHARGES NO DUTY ON FOXES.

Second. We deny absolutely the statement made that a "Canadian duty on nerican silver and black foxes of 25 per cent ad valorem" is in effect. It is a matter fact that no such duty is being charged by the Canadian Government. The comssioner of customs of Canada, under date of June 11, 1921, under the caption, 'ubject: Tariff status of live foxes," says:

'You are advised that foxes and other wild animals for breeding purposes or show rposes have been classified by the department as free of customs duty under tariff m 701."

This fact certainly nullifies the argument which has been stressed before your comttee that a duty to offset the alleged Canadian duty should be written into the new iff bill.

PROPOSED HIGH TARIFF NOT BENEFICIAL.

Third. We do not agree with the argument of Dr. E. W. Nelson, Chief of the reau of Biological Survey, that "This high tariff will be beneficial in assisting erican breeders in building up the quality of the breeding stock in the country and is materially benefit this new industry."

On the contrary, we feel sure that the said duty of $350 per head, which is excessive l practically prohibitive, will be of great detriment to the fox industry and will it out a great many of the best breeding foxes from Canada, which fox raisers in this intry so much need in the development of the business in the United States. We ert, without fear of successful contradiction, that there are not at the present time this country enough high-grade breeding foxes among the ranches to supply the itimate demand for the next few years.

PRESENT QUARANTINE REGULATIONS SUFFICIENT.

Fourth. On June 1, 1921, there became effective a new quarantine order of the partment of Agriculture regulating the inspection and the shipment into this coun' of Canadian foxes that, in our judgment, fully meets the present needs as to the estion of inferior or diseased or infected foxes that may be offered at United States rts of entry.

PROHIBITIVE AS TO CANADA.

Following close on the heels of this new quarantine order, the placing of a duty of 50 per head on live foxes shipped in from Canada would seem like piling it on, and ictically says to Canada and Canadian fox breeders, "Keep out—we do not want your tes at all."

AD VALOREM DUTY OF 10 PER CENT NOW IN FORCE.

Fifth. In the statement on sheet 3 of the Williams-Sterling brief, under the head "Revision of present tariff necessary," is the misleading assertion that, "The present iff schedules provide for the "free" importation of animals for breeding purposes. i exception should be made in the case of silver or black foxes."

It is the fact that the present tariff schedules do not provide for the free importation foxes for breeding purposes, but an ad valorem tax of 10 per cent is now charged the United States on such foxes. We maintain that this present tax of 10 per cent valorem or an equivalent specific tax, is quite sufficient to protect the fox industry this country.

NO 25 PER CENT TARIFF IMPOSED BY CANADA.

Again, we call your attention to the misstatement at the bottom of sheet 4 of the illiams-Sterling brief, which says: "Canada, practically a free trade country, where t farms started and with six to seven times as many silver foxes in captivity as in e United States ranches, impose a 25 per cent ad valorem tariff on American silver tes."

STORM OF PROTEST AGAINST DUTY.

Since the Ways and Means Committee submitted the new tariff bill to the House Representatives on June 29, 1921, and the proposed $350 duty has become known the fox raisers of the United States, a storm of protest is going up against such an cessive duty, which would be in effect practically prohibitive. It is asserted by many at the proposed tariff is in the direct interest of a few large fox ranchers in the United ates who want to shut out Canadian competition and force their fellow countrymen purchase from said ranchers.

A NEW AND TRAVELING INDUSTRY—LET IT ALONE.

We do not believe that the silver and black fox industry has yet reached the stage of development in this country when legislation should be passed in the interests of the few as against the interests of the many connected with it.

In many of the Northwestern States, like Ohio, Illinois, Iowa, Wisconsin, Minnesota, the Dakotas, Washington and Oregon, there are many people who are just learning about this wonderful industry and who want to have an opportunity to do as earlier fox raisers in the United States have done, buy selected, high-grade animals of the first quality from Canadian ranches without having to pay such a high duty as is proposed in the present tariff bill.

We trust and believe that a careful review of the true facts in connection with this matter, all of which we feel sure have not been presented to your committee, will cause you to favor an elimination of the proposed duty, or at least a reduction of same to a specific amount not more than the present 10 per cent ad valorem duty.

Respectfully submitted.

JAS. S. HANSON.

SPRINGFIELD, MASS., *July 14, 192[illegible]*

Hon. W. C. HAWLEY,

Chairman Subcommittee on Schedule G.

Committee on Ways and Means, House of Representatives, Washington, D. C.

SIR: I have before me copy of "Tariff Information, 1921," "Specific Tariff on Live Silver or Black Foxes," also the reply of Mr. Jas. S. Hanson, one of the large fox ranchers of the United States, with ranches at Penacook, N. H., and I indorse Mr. Hanson's reply entire, although he has not placed it as strong as the facts warrant.

The fox raisers as a whole did not for a moment think that an exception would be made to foxes imported for breeding purposes, as from time immemorial high-grade breeding stock such as horses, cattle, swine, etc., have been imported practically free of duty, to improve the strain in the United States. To-day every fox rancher in the United States considers it a valuable asset to state that his original stock came from Prince Edward Island, and the infant industry in the United States needs high-grade stock to improve the present quality of foxes, which are very much inferior to the average foxes in Canada, for in Canada they have been raising foxes in captivity for some thirty-odd years, while in the States the older ranches are not more than 10 years old and in some of the northern States the industry is less than [illegible] years old.

There are a few good foxes in the States, and it is the few that will be benefited, but not the great majority, nor the prospective rancher who desires to enter this [illegible] industry.

Furthermore, the facts presented to you by the few breeders state that "95 per cent of all fox breeders in the United States" are in favor of this excessive proposed duty, while I believe the reverse is true, that 95 per cent of the fox breeders are opposed to this duty, and also the statement that Canada imposes a 25 per cent duty on the importation of foxes into that country is absolutely wrong, and so on, through the article that was placed before you.

It would not mean any additional revenue to the Government, as the statistics show that approximately 1,000 silver and black foxes were imported into the United States during the past year, and with a $350 duty on each fox but very few foxes would be imported. Hence it would be far better, from a Government standpoint, to let the duty remain as it is, 10 per cent on breeders, or—what would be still better—absolutely free, because if fox breeders need the high-grade foxes to improve the quality of the foxes they have to-day, a low duty, or no duty at all, would be decidedly to the advantage of a great majority of fox breeders, at least 90 per cent of them.

The reason Congressmen have taken little interest in this measure is because so little is known about the industry by the average citizen of the United States or Congressmen in general. Hence this bill was "slipped over on you" to the detriment of the majority of the people because so little was known about it.

It is one of the leading industries of Prince Edward Island, and can be made an important industry in the United States if not given a "knock-out blow" in its infancy.

I am inclosing you a letter which was published in the Black Fox Magazine in J[illegible] before I knew of the $350 proposed duty, which I believe is worthy of your earnest consideration.

As I believe you are absolutely fair minded, and intend to do what is best for the majority, I trust you will see that the specific duty of $350 per fox is killed, and the matter rests largely in your hands.

can not be too emphatic in my positive statement, knowing the fox industry as l as I do, that the proposed duty would work a decided injury on the industry and ι benefit to but a very few of the ranchers who have high-grade quality foxes, and it ıld retard the industry for years to come.

t the last international fox show at Boston, where foxes were inspected and graded, ɔce Edward Island carried off the first prize for having the best quality of foxes his exhibit, and there were but very few Prince Edward Island foxes exhibited, great majority being from the United States.

: is a well-known fact that Prince Edward Island has quality foxes that the United ɛs needs, and it seems almost a crime to handicap an infant industry in the United ɛs by placing an almost prohibitive tax on breeders.

rusting that you will pardon the length of this letter and give it the serious con- ration that it deserves, and that your good judgment will not allow you to be instru- ıtal in killing so promising an infant industry, I beg to remain,

Most respectfully, yours,

F. E. MUZZY.

BRIEF OF C. T. DRYZ, EAGLE RIVER, WIS.

s one of the largest breeders of and dealers in silver foxes in the United States I am ɔcially interested in the proposed change in our tariff laws, as far as they affect fox industry.

am now building a 400-pen ranch at Eagle River, Wis. When this is completed ɒeans practically a half million dollar investment. I am importing most of my ɛs from Canada, and if this new tariff goes into effect in its present shape it will ctically mean a discontinuance of my operations here on the large scale that I 'e started. Other ranches are being built in this vicinity which will be similarly cted. One of these is a $100,000 corporation.

f this tariff was revised so as to admit high-grade registered foxes free of duty and heavy duty put specifically upon poor foxes it would be a good thing, as there are nearly enough of the best grades of foxes in the United States to meet the present ɒand.

t present there is a 10 per cent ad valorem duty on silver foxes entering this country. ɪs duty is really all the industry can stand. I believe silver foxes are the only eding animals imported to-day on which a duty is charged. Why not put silver ɛs on an equal footing with other animals? To pass the tariff as recommended by Ways and Means Committee of the House in H. R. 7456 will, in my judgment, iously hinder the development of the industry in the United States.

COMPARISON OF TARIFF ACTS OF 1913 AND 1921.

I would first like to call attention to the several paragraphs of the tariff act of October 1913, under which we are now operating, and point out how these paragraphs and changes made in them in the new tariff act (H. R. 7456) affect foxes and the fox lustry of the United States.

Under Schedule G, dutiable list, paragraph 187 (act 1913) provides: "All live imals not specially provided for in this section, 10 per cent ad valorem" duty. ıder this paragraph foxes have heretofore been imported from Canada, paying the per cent ad valorem duty, because of the fact that a herd book of Canadian pedi- ɛs had not been accepted and recognized by the United States Department of riculture, so as to admit foxes under the free list.

Under the new tariff act (H. R. 7456) the old paragraph 187 is practically repeated follows:

"PAR. 716. Live animals, vertebrate and invertebrate, not specially provided for, per centum ad valorem."

This paragraph 716, it will be observed, changes the old duty from 10 per cent ad lorem to 15 per cent ad valorem and would seem to cover any desirable advance in e tariff as far as live animals (including foxes) are concerned.

Paragraph 397 of the tariff act of October 3, 1913, provides for the free importation animals for breeding purposes, subject to very strict regulations and restrictions as quality, pedigree, etc., which would seem to fully protect anyone importing animals der this section.

Heretofore foxes have not come in under this section because of the absence of any rd book showing pedigrees of foxes acceptable to the Department of Agriculture. ıch a herd book is now being prepared, and the Canadian Government is recognizing d backing pedigrees of the best grades of foxes. This registration will doubtless be

recognized by the Department of Agriculture of the United States in the near future and silver-black foxes meeting the requirements will doubtless be admitted free the same as other animals, such as horses, cattle, sheep, etc.

Paragraph 1507 (p. 174, H. R. 7456, Senate bill, July 27, 1921) copies exactly paragraph 397 of the act of October 3, 1913, except that after the word "purposes," in the fourth line of said paragraph 397, the words "except black or silver foxes" are inserted.

This exception will effectually shut out high-grade, pedigreed silver and black foxes from Canada, no matter how closely they might meet the very careful regulations safeguarding the quality of the animal, as set forth in the body of said paragraph 1507. It seems unfair to thus cut out silver black foxes when other classes of animals for breeding purposes are admitted under this paragraph free of duty. The proponents of the change of old paragraph 397 seem to have overlooked the real effect of paragraph 1507 or to have desired to establish an embargo, with a view to shutting out Canadian competition.

I most earnestly urge the Senate committee to change paragraph 1507 by cutting out the words "except black or silver foxes" now appearing in lines 22 and 23, page 174 of the Senate bill, leaving the paragraph exactly the same as paragraph 397 of the act of October 3, 1913, which provides for the free importation of high-bred registered animals for breeding purposes.

This is really the most important and vital change that should be considered in connection with the subject of silver black foxes, and, indeed, with the important subject of the reciprocal free importation of animals for breeding purposes between the United States and Canada. To make an exception of foxes would seem to invite others to attempt to make exceptions of certain other breeds of cattle, horses, sheep, etc. It is establishing a very bad precedent, besides doing a manifest injustice to fox breeders in the United States who are anxious to have imported free of duty the best grades of foxes which they so much need at the present time in building up this new and thriving industry. I understand that protests have been made by breeders of other classes of live stock against any meddling with old paragraph 397 at the request of a few fox men who seem to be looking only after their own selfish interests, regardless of disturbing present smooth-working relations between this country and Canada.

Paragraph 715 "Black or silver foxes, $350 per head," is entirely new, and the heavy duty suggested again seems to point to a desire on the part of the proponents of this duty to shut out competition, because the same people who proposed the $350 duty in this paragraph also proposed shutting out silver black foxes by the exception of these animals in paragraph 1507.

Since paragraph 716 carries an ad valorem duty of 15 per cent, and supposing paragraph 1507 should be changed so as to be the same as paragraph 397 of the present law, thus admitting under the free list pedigreed foxes, it would seem that there is no excuse for such a heavy duty or even for any specific duty at all to shut out common grades of foxes. A specific duty of $200, at the very outside, would seem to meet the requirements of the case.

In conclusion I again earnestly request and urge that paragraph 1507 be changed as I have previously suggested, because I firmly believe that, if it stands as it is in the present bill, it will be very damaging to the fox industry in this country.

I attach hereto a copy of a communication I sent to the Black Fox Magazine of New York and which appeared in the issue of August, 1921, which sets forth my views in regard to the industry at large and the effects upon said industry of the proposed tariff regulation.

I do not understand that the Bureau of Animal Industry or the Bureau of Biological Survey favor the drastic exception made in paragraph 1507, where "black or silver foxes" are entirely and specifically shut out, regardless of their quality, breeding, pedigree, and regardless of how closely they meet the requirements of the very strict and complete regulations and restrictions set out in the body of said paragraph 1507 in regard to all animals imported, which would, of course, include foxes as well as horses, cattle, sheep, etc.

What we all want, both officials and fox breeders, is to keep out poor foxes and admit free of duty high-grade foxes under proper restrictions and quarantine regulations such as are now in operation under the supervision of the Bureau of Animal Industry and the Bureau of Biological Survey.

LIVE AND LET LIVE.

[By C. T. Dryz, in The Black Fox Magazine, August, 1921.]

t has been a long time since I have written for any publication, but the conditions :he fox industry just at present date impress me to give my views on the situation ich I consider very critical at this time.

'ou are probably aware of the fact that there is a great tendency on the part of some ranchers in the United States to shut out our main source of supply of foxes.

am afraid these same parties do not realize in any way just what this would mean. e, some of them have a number of good foxes on their ranches that would score h and are good quality, but in general there is no very large number. Their idea ns entirely to be the disposal of their foxes at a high figure. They know it to be ct that the same quality foxes that they have can be obtained to-day in Canada, ich is the main source of supply, at a very reasonable figure.

s I look upon it, if these parties should be successful in having such an exorbitant y passed as is proposed it would mean that new people who would start now would e to pay a very high price, indeed, for any first-class animals they acquired; far than the present fur value of the animals is worth.

o not misunderstand me when I make the above quotations, because personally ould like to see foxes on the same basis as, say, for instance, Holstein cattle are ay. The good fox will sell at a high price and the poor fox at a low price, based ly on its heredity. This can only be accomplished by the mutual cooperation he associations and all ranchers and the Canadian must be seriously considered his.

ven should this move on the part of a few men be successful, it will not help them ly as much as they imagine. They will be forced to ask much lower prices than contemplate for their foxes, because then they will get real competition from adian ranchers who will cut to the lowest possible figure in order to undersell the ted States ranchers.

hy be selfish? Throw the gates of competition open to the world and let the man win. That's real business principles.

o prove, further, that this proposed tariff would do considerable damage, it is only ssary to look at my books. I have several hundred customers who contemplate ting ranches in the United States in the next few years, and I do not believe they ld pay an excessive tariff in order to start, but would most likely move into ada and start there. Furthermore, I have just returned from a three weeks' trip, while on this trip I had to come in contact with quite a few ranchers, and in king of the tariff to them they stated that they were in favor of a tariff, but not as presented. Their idea of a just tariff is that all good foxes be admitted free of ge and a heavy duty placed on poor foxes.

am sure that if the associations will canvass their members they will find the rity of them are in favor of the duty as I state above and are against the duty oposed.

nada charges no duty on foxes and there is no duty on any other pedigreed live c going between Canada and the United States. I can not understand why should be made an exception of. It would be much better for all concerned if were handled in free trade as other live animals are. This would give the ed States ranchers a chance to build up their stock at a normal cost and also give Canadians a chance to improve their stock, making it harmony and cooperation ughout.

e associations to-day total a membership of practically 20 per cent of the people ested in the silver-fox industry in the United States, and I hope the time is not far away when they will control a full 100 per cent.

elieve in the motto "Live and let live." I can not understand why anybody ld try to squeeze out anyone else. As stated above, I believe in "Letting the man win," and if more ranchers would put this in their mind I am sure the fox stry would be far more successful than it is to-day. As it is, they all follow in otsteps of one leader and it is the man that keeps a step ahead of his competitors will score the biggest success.

en, let's all shake hands and live and let live.

FRESH AND FROZEN FISH.

[Paragraph 718.]

STATEMENT OF HON. WESLEY L. JONES, SENATOR FROM WASH-INGTON.

Senator JONES of Washington. With reference to fish, paragraph 718, our people want a tariff of 2 cents a pound on fresh fish, together with a proviso providing for either a straight 2 cents a pound on fresh fish or, at any rate, a provision that would read something like this:

All halibut, salmon, swordfish, and sablefish, fresh, frozen, or packed in ice, 2 cents a pound: *Provided,* That no halibut, salmon or sablefish, fresh, frozen, or packed in ice, taken from the north Pacific Ocean or its tributary waters, shall be admitted into the United States through a foreign country unless same shall be in bond from an American port. All other fish, fresh, frozen, or packed in ice, not specially provided for, 1 cent a pound.

An item similar to that was put into the Simmons-Underwood tariff bill when it passed the Senate. We had quite an extensive discussion of the reasons, especially for the proviso. (Pages 131[illegible] 13186, part 13, vol. 53, 1st sess., 64th Cong.)

Briefly, I may say this, however, that the Canadian authorities are using every possible method to divert the fish industry to Prince Rupert. They have put all sorts of restrictions and discriminations through their orders in council against American fishermen and American fish, with the avowed purpose of diverting the business to Prince Rupert and then sending the fish over the Grand Trunk Railway to eastern markets.

The purpose of this is to protect and keep under the American flag the ships engaged in the fishing industry in the North Pacific in Alaska, and also to encourage the transportation of these fish to eastern markets over American railroads.

As I say, I am going to refer to that discussion and give the pages. You will not need to print it in the record, but it will make it available. I hope that the matter will be given the very careful consideration of the committee.

I will endeavor to find where Senator Chamberlain made a speech with reference to the matter and discussed it and pointed out the discriminations. They are very clear and very plain. The purpose is openly avowed in the orders in council that were passed. (The reference to Senator Chamberlain's remarks, subsequently submitted by the witness, is as follows: Pages 14024 to 14028, part 13, vol. [illegible] 1st sess., 64th Cong.)

I want to present for printing in the record the amendment [illegible] I spoke about the other day with reference to fish; and I also want to present another amendment covering the same subject, [illegible] amendment has been suggested by our people.

I ask, as well, that in connection with the same a telegram [illegible] some letters I have here with me be printed, and that, I think, [illegible] conclude the matter.

Insert a new paragraph after paragraph 718:

"Halibut and salmon from the waters of the North Pacific Ocean, [illegible] frozen, or prepared, for shipment at or shipped from a foreign port, [illegible] per pound."

SEATTLE, WASH., *January 5, 1922.*

n. WESLEY L. JONES,
United States Senate, Washington, D. C.

Since 1915 Canadian ports have gradually absorbed Alaska's fresh-fish busi-
s, this through their railways and orders in council. It is imperative that
ough prohibiting shipment from foreign port or through tariff on fresh or
zen fish prepared for shipment at foreign port this business should be cen-
ed in Alaska. If Alaska is to develop we must secure for her her own
ources and commerce.

SEATTLE CHAMBER OF COMMERCE, ALASKA BUREAU.

JANUARY 3, 1922.

. W. L. JONES,
United States Senate, Washington, D. C.

EAR SENATOR: Pacific coast interests have suggested that a duty placed
fish prepared for shipment at foreign ports would give the fishing indus-
at American ports the needed protection, and less likely to draw opposition
the measure we have urged, which would entirely prohibit shipments so
ared. It is therefore requested that we work to secure the following as a
of the general tariff bill:

Halibut and salmon, fresh, frozen, or prepared for shipment at a foreign
, 3 cents per pound. All other fish, fresh, frozen, or prepared for shipment
foreign port, 1 cent per pound."

duty on only foreign-caught fish will not correct the conditions now exist-
at the Canadian Pacific ports. Such a duty would simply encourage Cana-
operators to use American bottoms out of their ports. The flag would
ide free entry of their product to our markets, though the industry would
in Canadian as completely as it is to-day, for the fishing fleet regardless of
would be manned, provisioned, and operated from Canadian ports.

e sole object of this tariff measure is to make the Alaska fisheries a re-
e of American ports, instead of permitting them to be exploited by Cana-
interests and a fleet sailing from Canadian ports, the product of which is
ely consumed in the United States. The duty suggested will not affect the
of fish to either producer or consumer; it simply moves the market place
e fishing fleet from Canadian to American soil, making it an American
which will be highly beneficial to the future growth and prosperity of
a.

ish to call your attention to the attached copy of a resolution passed by
ommercial Club of Ketchikan, Alaska, July 11, 1921.

Respectfully,

H. C. STRONG.

---

e Congress of the United States:

eas the fresh-fish industry of the Territory of Alaska is one of the great
important resources of the said Territory; and

eas the said industry should be encouraged as a means of developing and
ding up the said Territory of Alaska; and

eas, if proper protection is given this industry to prevent the fresh fish
ght in the waters of and adjacent to said Territory of Alaska from being
ked and prepared in foreign countries for shipment to the markets of the
ted States, a permanent fishing population will settle in Alaska, improve
ll homesteads, and aid in the settlement and development of the Terri-
: Therefore be it

olved by the Commercial Club of Ketchikan, Alaska, That the Congress
United States be, and hereby is, respectfully memorialized and urged
e in any tariff law which may be passed by the Congress a provision
g as follows:

fresh or frozen halibut or salmon, or the products thereof, arriving at
merican port from or through any foreign country, which have been
d or prepared for shipment in other than American territory, shall be
t to a duty of 3 cents per pound; and other deep-sea fish, or products
f, arriving at an American port from or through any foreign country,
have been packed or prepared for shipment in other than American
ory, shall be subject to a duty of 1 cent per pound."

Be it further resolved, That a copy hereof be sent to the President of the United States Senate, the Speaker of the United States House of Representatives, the chairman of the Committee on Ways and Means of the United States House of Representatives, the chairman of the Committee on Finance of the United States Senate, and the Delegate to Congress from Alaska.

J. C. BARBER, *President*.

Adopted July 11, 1921.
Attested:
A. G. SHOUP, *Secretary*.

MEMORANDUM SUPPORTING TARIFF ON FRESH AND FROZEN FISH.

The offshore fisheries of Alaska—that is, fish taken from the Pacific Ocean or its tributary waters—is a national resource which should be the means of supporting large, permanent, and prosperous communities in Alaska.

However, to make this a reality, constructive and protective legislation is imperative. Something must be done which will create in Alaska a market for these products, a market which will bring the producer and the representative of eastern distributors in the United States together at ports in Alaska.

To-day the economical market for the Alaska fisheries is in a foreign port at the terminus of a Canadian railway, and here these fisheries, together with the buyers for the consumers of the United States, are building a big industry. The deep-sea fisheries of Alaska and American markets are jointly supporting a larger population and a greater volume of business at Prince Rupert and Vancouver, British Columbia, than they are doing for all of the coast of Alaska.

Legislation alone will move this market and its benefits from Canadian to American ports in Alaska. Transportation problems in Alaska will solve themselves when this volume of business originates in Alaska instead of at Canadian ports, therefore Congress is petitioned to enact the following tariff measure:

"All fresh or frozen halibut or salmon, or the products thereof, arriving at an American port from or through any foreign country, which have been packed or prepared for shipment in other than American territory, shall be subject to a duty of 3 cents per pound; and all other deep-sea fish, or the products thereof, arriving at an American port from or through any foreign country, which have been packed or prepared for shipment in other than American territory, shall be subject to a duty of 1 cent per pound."

This tariff measure will bring to Alaska the wholesale market, which is now being maintained in Canada. It will be instrumental in improving our transportation facilities and be the means of bringing thousands of home builders. Alaska will become the permanent home of a large population which is now being supported in Canadian ports by our American fisheries and American markets.

To-day a vessel sails from Prince Rupert; she may be either an American or a Canadian, but she will be outfitted with supplies bought in Canada where her business is transacted; she proceeds to the fishing banks adjacent to Alaskan shores, fills up with fish and returns to the Canadian port where the fish are sold for shipment to American markets but paid for in Canadian and the proceeds divided and distributed through various channels in Canada. Canada has thereby gained a valuable asset at Alaska's expense.

The ultimate home of a fishing people will be in or near the port where fish are unloaded and sold, and should Canada be permitted to continue as the main distributing point of North Pacific fish to the American market, fishermen engaged in taking these fish will gradually settle in Canada and become Canadian citizens, transferring their vessels to Canadian registry.

Therefore no act of Congress can do more to give Alaska a permanent self-supporting population than the above tariff measure, and it will do so without adding any cost to the consumer and without placing any burden upon the fisherman. It merely moves a market and makes Alaskan ports the center for North Pacific fishing products which are going to the United States.

The fish will be discharged at Alaskan ports where they will be paid for in American money and be subject to American inspection and American regulation. We are asking only for such legislation as will insure a method whereby payments made by the markets of the United States for products from the waters adjacent to or within convenient reach of American

ill be used for the maintenance of an American fishing fleet, the development American enterprises, and the building of American homes on American soil. Respectfully submitted. •

COMMERCIAL CLUB OF KETCHIKAN,
By J. C. BARBER, *President.*

Amend paragraph 718 to read as follows:
"All fish, fresh, frozen, or packed in ice, not specially provided for, 2 cents pound: *Provided*, That no salmon or halibut from North Pacific waters ill be admitted into the United States through a foreign country unless the me are shipped in bond from an American port."

ATEMENT OF H. C. STRONG, REPRESENTING THE COMMERCIAL CLUB, KETCHIKAN, ALASKA.

Mr. STRONG. I am here at the request of the Commercial Club of tchikan, Alaska, and am a member of its executive board. I wish file with you a message from the governor of Alaska, also a letter dressed you to-day by Mr. Hoover, our Secretary of Commerce, ich requests that you provide relief for the situation which conts America's interest in the fisheries of the Pacific coast. We e in Alaska a vital point, which has not been made clear to this mittee from a truly American standpoint, but owing to the lates of the hour I must be content with a short statement and the filof two briefs, one prepared by the Commercial Club of Ketchi and the other by myself.

Senator McCUMBER. They will be printed in the record.

Mr. STRONG. At the Department of Commerce there are numerous munications from business houses, commercial associations, and ers from many operators of American fishing vessels which fully lain the hold Canada now has on the fishing industry of the ific.

The supply of fish which are found in the waters off Alaska's coast f the highest quality to be found anywhere in the world, and r are consumed by Americans, the greater portion going to points of the Rocky Mountains, yet this wonderful resource and ket is centered at the Canadian port of Prince Rupert, Canada, ch is within 40 miles of Alaska.

his is due to a combination of geographical and commercial conons, together with the intense interest and support of the Can n Government in the development of this industry at her ports, as compared with the utter lack on the part of our Government o the present time to pass a simple protective measure which in t would transfer the market place, the buyers, the shippers, and headquarters of the fleet fishing for the American consumers Canada across the international border line into Alaska, mak this important resource and industry a support to Alaska in d of Canada.

t Ketchikan, Alaska, which is but 90 miles from Prince Rupert, hed through inside waters navigable every day of the year, and iles closer to the fishing banks, you find better harbor conditions at the Canadian port. We have many miles of perfectly prod deep-water frontage, which is true of many harbors in south-

ern Alaska, and at Ketchikan we now have constructed whar
and warehouse of sufficient capacity to handle the entire fish busine
now handled at Prince Rupert. Every facility can and will be pro
vided at Alaska ports to handle the industry, but the business wi
not be there to handle until our Government passes an act placing
duty on all fish entering the United States which have been ice
boxed, frozen, or otherwise prepared for shipment at other tha
American ports. Shipments reaching the United States throug
Canada should be obliged to be in bond from an American port i
they are to be admitted free of duty.

Fishing interests at Prince Rupert and Vancouver and those wh
have represented them in Washington do not object to our Govern
ment placing a duty on foreign fish, but they strongly object to th
wording of a tariff measure that will give Alaska and Americ
interests the protection needed in this industry. This is the po
you should clearly understand. The Canadian institutions are han
dling American fish which would not be affected by the word
of a usual tariff amendment. During the year of 1920 vessels
American registry to the number of 258 were engaged in fishing op
ations out of the port of Prince Rupert and 24 from the port
Vancouver. This number and the volume of business has increas
during the year 1921 though we have not the exact figures. Th
vessels of American registry landed in excess of 65 per cent of
the deep-sea fish discharged at Canadian ports. The catch of th
vessels, on account of the American registry of the hull, ma
them American fish, but they are operated from the Canadian po
which derive the entire benefit of their production. The value
their catch is there disbursed, entering Canadian channels of tr
and the vessels are of the same value to Canadian ports as those
Canadian registry. The Canadian packers and shippers send ev
pound of it through to the United States, and American consum
through their fish dealers are actually paying Canada for a prod
taken from the Alaska fishing banks, the industry being of no ass
ance to American ports.

Canadian ports are now using less than 35 per cent Canadian h
in their fisheries, and a duty on foreign fish would merely cause th
to employ an increased number of American hulls, but Canada wo
still hold the industry, the fishing population, and all the prosper
that goes with it. The United States would still be paying Cana
ports for the fish taken from Alaskan waters, yet on account of
fish being taken or caught by vessels of American registry the
classed as American fish, and the Canadian firms are shipping th
in bond through Canada, entering them in the United State
American fish free of duty, though Canada has received the valu
the cargo and the benefits of the industry.

Considering the vast fisheries adjacent to the shores of Alas
which are not equaled by those of any nation in the world, toge
with the thousands of miles of Alaska's coast line which I beli
will never be settled and developed by other than a fishing pop
tion, I sincerely believe you should adopt the amendment:

Provided, That no fresh or frozen fish taken from the North Pacific Ocean or utary waters shall be admitted into the United States from or through any eign country except when the same shall be in bond from an American port.

This is the only sure way of giving Alaska and American ports the l benefit of her fisheries. Canadian laws prohibit fish discharged American vessels at her ports from going into consumption in nada, not even upon the payment of duty, and American fishing sels in the Pacific have no market for their fresh and frozen fish ept that afforded by the consumers of the United States. So why uld we permit Canada to continue to profit by this industry to great detriment of Alaska and American ports?

'he general public has the impression that the only way of getting ef through a tariff bill is by placing a duty on the article desired protect; thus most of the requests have been that you place a duty in fish that have been prepared for shipment at a foreign port. libut and salmon are high-priced fish, the former often reaching rice in excess of 20 cents per pound paid to the fishermen at the t of discharge on the Pacific coast, and, due to the fact that ada controls the logical route of travel between our northern eries and our markets of the Eastern States, a duty of even 3 s per pound would still leave Canadian establishments at Prince ert in position to greatly embarrass shippers from Alaska who ht be using the Canadian route to eastern markets; hence to be lutely effective we should place an embargo as provided in the re-suggested amendment.

would suggest that the amendment you adopt to cover this situ- n be so worded as to take effect on and after 60 days after the age of the act. This would allow ample time to fully establish needed transportation connecting Alaska with rail terminals and adjustment of business connections on the part of those now buy- fish for American markets at Prince Rupert from the Canadian to American ports. American interests have anticipated the need dditional facilities in Alaska to handle the business they believe legislation is to bring to their Territory, and many thousands of rs, running into the six figures, are now being expended by ricans to handle this business, which can and will move direct a Alaska upon the passage of this legislation, to greater advan- to America, her fishermen, and consumers alike, for one vessel day can transport all the fish brought in by the entire fleet at cost to all and with greater dispatch than is now required by the re fleet proceeding to the port of Prince Rupert, which is 90 miles her from the principal fishing banks than is the principal fishing in Alaska, which is Ketchikan.

The briefs and other papers referred to are as follows:)

JUNEAU, ALASKA, *November 10, 1920.*

. STRONG.
Hotel Raleigh, Washington, D. C.:

ve telegraphed Senator Smoot requesting that he direct fish tariff matter you. Suggest you make an appointment with him for Saturday. I am y to be of any possible service.

BONE, *Governor.*

DEPARTMENT OF COMMERCE,
OFFICE OF THE SECRETARY,
Washington, January 9, 19

SENATE FINANCE COMMITTEE,
United States Senate, Washington, D. C.

SIRS: Some legislation is being urged with a view to protecting Amer- fishery interests on the Pacific coast in a manner that will make this indus- resource of American ports. A large volume of this business is being han- through foreign ports, and I feel that legislation, probably through a duty, should be enacted which will tend to transfer this business, supp- entirely by Americans, to American ports.

Yours, faithfully, HERBERT HO

BRIEF OF H. C. STRONG, REPRESENTING THE COMMERCIAL CLUB, KETCHI ALASKA.

It is respectfully requested that H. R. 7456 be so amended as to as- establishing at American ports the American fishing industry and fishing which on the Pacific coast is now centered at Canadian ports. To accomp this two measures have been suggested, either of which I believe would be ful. They are as follows:

"All fresh or frozen halibut or salmon, or the products thereof, arriving an American port, from or through any foreign country, which have been pa or prepared for shipment in other than American territory shall be subject a duty of 3 cents per pound; and all other deep-sea fish, or products there arriving at an American port, from or through any foreign country, which h been packed or prepared for shipment in other than American territory sh be subject to a duty of 2 cents per pound"; or, "Provided, That no fres frozen fish taken from the North Pacific Ocean or tributary waters shall admitted into the United States from or through any foreign country ex when the same shall be in bond from an American port."

The object is to gain and keep the control of our Pacific fishery resour- American ports, making them an asset of our own country. It is a subject important to America and vital to the future growth and prosperity of Al

The Alaska fishing banks are not exceeded in extent or resourcefuln- any in the world, and the United States is the greatest market for high fishery products; but due to the geographical position of Canada and the in shown by her Government in fostering the fishing industry, we now s- Alaska fisheries centered at the Canadian port of Prince Rupert.

The distributors of fish in the United States remit to Canada to pay fish taken on the Alaska banks. American markets and the Alaska f banks are pouring wealth into the Canadian port, where the industry is the stay of a growing, prosperous community.

This matter has been discussed on the floor of the Senate by Senator J of Washington and Senator Chamberlain of Oregon, and their remarks found in the Record of the Sixty-fourth Congress, pages 15024 to 150 sive, and 16598 to 16604, inclusive. These pages contain statistics and from our Federal departments, and go into details explaining how Cana been able to gain control of this industry.

Since that time Canada has made an effort to negotiate a treaty with country which would bar us from enacting any legislation affecting thes eries. From a map of the west coast of this continent, I think I shall b to show you how securely Canada will control our supply of fresh fis the North Pacific banks until such time as we pass effective legislation. from a commercial and geographical standpoint, Canada lies between the of supply off the coast of Alaska and the markets of our eastern States

Prince Rupert, British Columbia, at the Pacific terminus of the Grand Pacific Railway which is close to the border of Alaska, is provided with rail connection with all eastern American cities. Here every provis been made to foster the industry; the Canadian Government has throu sidy and the use of "orders in council" put the Canadian port in absol trol of the fishing industry of the North Pacific.

Canada fully realizes that regardless of national registry of vessels en that the port at which the fishing vessels discharge their catch, where th are weighed and paid for, iced, and boxed for shipment to the consu where the fishermen and crew are paid off, and the vessel is reprovision

next trip has gained the value of the cargo so discharged. The vessel, ·w, and industry has become an asset of their port. Their object is to hold : Pacific fishing fleet at their ports, to make it an asset of Canada, though ' product is taken from the Alaska banks and American consumers are pay- ; Canada for the same.

l'he passing or enactment of one of the suggested amendments would correct condition; it would in no way affect the price of fish to the consumer nor t paid to the fishermen; it would merely transfer the buyer, the market ce at which the fishing fleet would center, to American soil, which is closer he supply of fish. It would result in an economic advantage. The industry ported solely by American consumers would be established on the American of the international boundary; the fishing fleet would be an asset of Alaska ead of Canada, as it is to-day. It would do more to repopulate the coast Alaska and give it the needed prosperity than any act Congress could pass. 'his is no discrimination against any foreign country; it is merely protect- our own through making it necessary that vessels, regardless of nationality, ing fish from the North Pacific Ocean or tributary waters, when the are e consumed by Americans, must be discharged at an American port.

anada has always fostered her fisheries and protected them in every known , and now she is, through "orders in council" and other means, reaching for controlling the American fisheries of the Pacific. Under existing condi- s, it would be absolute business suicide for an American institution doing iness solely at American ports to attempt to handle fresh fish between ska and eastern American markets in competition with the industry estab- ed at Prince Rupert. We would simply be playing into their hand, for ' lie between our supply and market.

MEMORANDUM OF THE COMMERCIAL CLUB OF KETCHIKAN, ALASKA, SUPPORTI[NG] THE TARIFF ON FRESH AND FROZEN FISH.

The offshore fisheries of Alaska—that is, fish taken from the Pacific Oc[ean] or its tributary waters—is a national resource, which should be the mean[s] supporting large, permanent, and prosperous communities in Alaska.

However, to make this a reality, constructive and protective legislation imperative. Something must be done which will create in Alaska a mar[ket] for these products, a market which will bring the producer and the represe[nta]tives of eastern distributors in the United States together at ports in Alaska.

To-day the economical market for the Alaska fisheries is in a foreign p[ort] at the terminus of a Canadian railway, and here these fisheries, together w[ith] the buyers for the consumers of the United States, are building a big indus[try]. The deep-sea fisheries of Alaska and American markets are jointly suppor[ting] a larger population and a greater volume of business at Prince Rupert [and] Vancouver, British Columbia, than they are doing for all of the coast [of] Alaska.

Legislation alone will move this market and its benefits from Canadia[n] [to] American ports in Alaska. Transportation problems in Alaska will [solve] themselves when this volume of business originates in Alaska instead of Canadian ports. Therefore Congress is petitioned to enact the following t[ariff] measure:

"All fresh or frozen halibut or salmon, or the products thereof, arriving [at] an American port from or through any foreign country, which have been pa[cked] or prepared for shipment in other than American territory, shall be subjec[t to] a duty of 3 cents per pound; and all other deep-sea fish, or the products the[reof,] arriving at an American port from or through any foreign country, which [have] been packed or prepared for shipment in other than American territory, [shall] be subject to a duty of 1 cent per pound."

This tariff measure will bring to Alaska the wholesale market, which is being maintained in Canada. It will be instrumental in improving our tr[ans]portation facilities and be the means of bringing thousands of home bui[lders.] Alaska will become the permanent home of a large population which is being supported in Canadian ports by our American fisheries and Ame[rican] markets.

To-day a vessel sails from Prince Rupert; she may be either an Am[erican] or a Canadian, but she will be outfitted with supplies bought in Ca[nada,] where all her business is transacted. She proceeds to the fishing banks [adja]cent to Alaskan shores, fills up with fish, and returns to the Canadian [port,] where the fish are sold for shipment to American markets, but paid f[or in] Canadian money, the proceeds divided and distributed through various cha[nnels] in Canada. Canada has thereby gained a valuable asset at Alaska's exp[ense.]

The ultimate home of a fishing people will be in or near the port whe[re] fish are unloaded and sold, and should Canada be permitted to continue a[s the] main distributing point of north Pacific fish to the American market, th[e fish]ermen engaged in taking these fish will gradually settle in Canada and b[ecome] Canadian citizens, transferring their vessels to Canadian registry.

Therefore no act of Congress can do more to give Alaska a perman[ent,] supporting population than the above tariff measure, and it will do so w[ithout] adding any cost to the consumer and without placing any burden upon th[e fish]erman. It merely moves a market and makes Alaskan ports the trad[e] for north Pacific fishing products which are going to the United States.

The fish will be discharged at Alaskan ports, where they will be pa[id for in] American money and be subject to American inspection and America[n regula]tion. We are asking only for such legislation as will insure a conditi[on] by payments made by the markets of the United States for product[s] from the waters adjacent to or within convenient reach of America[n] will be used for the maintenance of an American fishing fleet, the deve[lopment] of American enterprises, and the building of American homes on Amer[ican soil.]

Respectfully submitted.

COMMERCIAL CLUB OF KETCH[IKAN,]
By J. C. BARBER, *President.*

CURED AND PRESERVED FISH.

[Paragraphs 719, 721 and 1645.]

IEF OF J. L. FAWSITT, IRISH TRADE COMMISSIONER TO AMERICA.

appear before your committee representing the interests of the Irish salt-fish ers and exporters.

aking the returns for the six years 1914–1919, approximately 29,000,000 pounds esh mackerel and 27,000,000 pounds of fresh herring were landed annually on Irish coast.

he average exports over the same period of cured (salt) mackerel amount to 0,000 pounds and of cured (salt) herring amount to 7,000,000 pounds annually. eland's department of customs was abolished by the English Government a hun- l years back, and, as a consequence, the published returns of Ireland's external e do not show with what foreign countries Ireland carries on trade relations, is there available information as to the character or qualities of her exports to or rts from foreign lands. We have no means of ascertaining, for example, from the ial records of our foreign trade, to what countries and in what quantities we ship cured fish.

e United States' annual trade records show, however, that in the 6-year period ed above some 1,500,000 pounds of cured mackerel and some 2,100,000 pounds red herring reached this country annually from Ireland. Those connected with ish trade in Ireland know that these figures do not fully represent the quantities red fish that enter the American markets every year from Ireland. We believe, d, that the great bulk of our cured-fish exports come to this country indirectly gh English ports and from English brokers.

addition to the domestic supply of cured fish, the United States trade returns that on an average some 18,000,000 pounds of cured mackerel and some 58,000,000 ds of cured herring are imported for consumption in America every year from gn countries.

the year 1919 the largest supplies of salt mackerel came to this country from in the order named): England, Canada, Ireland, Norway, Netherlands, and and.

the same year the largest supplies of salt herring came to this country from (and e order named): Canada, Labrador, and Newfoundland, Scotland, Netherlands, nd, and England. Only in the year 1918 did Canada and Labrador and New- lland begin shipping supplies of cured herring to the United States. Both in and 1919 considerably more than half of the total American imports of cured g were supplied by Canada and Labrador and Newfoundland.

land, as your returns show, is the third principal supply country of imported rel on your markets: she is the fifth principal supply country of imported herring. 17, before Canada and Labrador entered the market, Ireland held the third on among foreign countries supplying herring to your people.

s generally understood that the salt-fish supplies on the American markets are y consumed by the working classes in the cities and towns and by agriculturists erior districts, where this is the only form of sea food suited to the peculiar con- s of living in such districts. To place a tax on imported salt fish would result reasing the price of this important and nutritious article of diet to these classes ır citizens.

loes not appear that any resultant gain would accrue to your national fisheries he imposition of such tax.

he first instance, American supplies of native cured mackerel and herring are tedly inadequate to meet the large domestic demand for this foodstuff. Your es appear to cater mainly for the fresh-fish market, which is certainly the most able branch of the trade.

ing the war, when imports of cured mackerel and herring fell off, the native ry did not respond to the opportunity thus afforded by the inadequate supplies g from Europe at the time to this country. The high prices then offering for ade of foodstuff did not tempt your fisheries to endeavor to supply the demand. ently, the fresh market absorbed the main bulk of their produce and gave them and quicker returns on their investments. The demand continued unsupplied ır native producers, and Canadian and Newfoundland supplies came forward to e want.

Again, in previous administrations when a tariff was imposed on foreign-cured entering your markets, such tariffs neither kept out the foreign supplies to an appreciable extent, nor did your native fish-curing industry avail of the opportunity provided by such handicap on foreign imports to secure the home market in mackerel and herring for the home-produced article. The tax merely increased the cost of the cured fish, both domestic and foreign, to the working classes in this country who, as already pointed out, are in the main the chief consumers of this food. It is quite possible, too, that the increased price demanded, under the tax, fish enabled the fresh-fish vendors to secure increased prices for their daily supply of fresh fish. Most taxes, where imposed to help a home industry, usually work after this fashion.

From my knowledge of the fish industry in this country, it appears to me that industry (when compared with the position of the imported salt-fish trade) now will always occupy a favored position here by reason of certain facts, knowledge which is common to all persons interested in the fish business, namely:

(*a*) The American markets can consume all the supplies of fresh fish made available for consumption by American fish-producing companies.

(*b*) The American market is not only at the door of the American fish industry, the market is at all times responsive to the American product as such.

(*c*) The long oversea haul with incidental heavy freights, insurance, protracted delays resulting in deterioration of quality of fish, financial loss to shipper, etc., constitute a big handicap and a financial tariff against the imported commodity and favor of the home product.

(*d*) The obsolete amd almost hopeless financing of foreign fish supplies entering United States markets make the trade practically an unprofitable one for foreign producers.

In my judgment, it would indeed be a very easy matter for American producers of salt mackerel and herring to capture and retain for themselves the native market in this commodity. They could secure the monopoly of the trade, and without asking the United States Government to put a tax on competing imported fish, provided they were in a position to supply the American market steadily with the quantities demanded. This it appears they are not in a position to do, and no tax that Government can impose on the foreign product will enable the American fish industry to get a hold of this trade in salted mackerel and herring.

POSITION OF THE IRISH INDUSTRY.

The fishing industry in Ireland is a declining one. This is borne out by the fact that there are fewer persons and boats now employed in the industry, and the annual catch is very much smaller than the catch a decade and more back.

The industry is inadequately financed and in an unorganized condition. little attention has been devoted to the industry by the English authorities not even protected from the marauding steam trawlers of neighboring countries. The facilities for marketing the catch are indifferent and constitute a severe handicap to the trade.

The fishing is mainly inshore drift-net and hand-line fishing. There are very trawlers of Irish ownership employed in the trade. The catch in the main consists of mackerel and herring.

Fishing is the main source of income for the 20,000 persons (with dependents numbering in all about 80,000 souls) employed in the calling.

Owing in the main to the absence of facilities for marketing the fresh catch, curing of the fish is largely followed.

The United States is and has, for a long number of years, been the chief market for the cured supplies of Irish fish.

Whenever the market for salt mackerel and herring is depressed in America, fisherfolk and their families in Ireland are seriously affected in their little incomes. An unresponsive market for Irish cured fish in this country reacts detrimentally upon the industry in Ireland.

The increased cost of living in this country depresses the market for cured fish. This means not only a drop in prices to the shipper, but it also means that unsold and unsalable supplies remain on hand at the end of the season.

To place a tax on imported cured fish entering America would mean increased cost of living to the poor in this country, and this would tend in turn to depress the market here for Irish salt mackerel and herring.

Just now, when steps are being taken in Ireland to organize and finance the industry adequately by the Irish government, a depression of the market here for Irish salt fish would retard such belated development as is contemplated there. We are

ie fisheries districts along cooperative lines; we are helping them financially, so as provide larger and more suitable motor-driven boats, better gear, and all-round etter facilities for the successful conduct of the industry. We have great hopes of, time, placing the industry on a paying basis, producing a better graded and superior iality article, and of enabling the fisherfolk to derive a decent income from the dustry, and so making it a benefit to them and to the nation as a whole. Here in ur country we are planning on marketing our cured fish on better conditions, finanil and otherwise, and this is a point that the importers here will appreciate. I peat, to impose a tax on these imports now would prove anything but helpful to us Ireland who are planning to build up an industry on sound lines, and who hope as a nsequence to produce and place on your markets a foodstuff unexcelled in quality d marketed on a strictly competitive basis.

There is one more consideration I wish to place before your committee, arising out this question, before I conclude. My mission to this country is to promote closer de relations between Ireland and America. Our external trade is valued at 700,000,000 in value yearly. That trade has been in the past practically the sole mopoly of England. Ireland is desirous of buying American goods where she can; is also desirous to sell to America such products as she has and that America may ed. The direct trade of America and Ireland is less than $100,000,000 in value nually. With good will and cooperation there should be little difficulty in increas; that trade tenfold. It would be to the mutual advantage of both the United ites and Ireland.

English shipping has had the carrying almost exclusively of Ireland's enormous eign trade. Ireland is most anxious to see American shipping in Irish waters. are prepared to support American shipping to the best of our ability. The United ites Shipping Board a year back placed some United States tonnage on the direct ierica-Ireland trade. I am glad to say that the venture has passed the experintal stage and is now on a permanent and paying basis. Full cargoes regularly go ward from New York to Irish ports. So far none of the United States ships have urned in ballast. Each ship brings back cargo for the American markets. Part the return cargo consists of the cured fish that we are now dealing with. Formerly s fish was imported here via Liverpool and on English ships. We are anxious to this trade increase and are planning bringing cargoes direct also to Boston. We ite your cooperation in this work. By allowing this fish to continue to come into ierica free of import duty you will help us to provide cargo in increasing quanti- for the American shipping now on the Irish route. Also, by not depressing our ports to your country by taxation, you will enable us to buy our requirements in er lines from your producers, and in larger measure than heretofore, and so to- her we may cement the commercial relations that now happily have been begun ler promising circumstances by our respective peoples.

ATEMENT OF ASHTON W. THOMAS, REPRESENTING THE PACIFIC CURED FISH ASSOCIATION.

Mr. THOMAS. Mr. Chairman, I appear here as a representative of Pacific Cured Fish Association, operating principally in Alaska; night say altogether in Alaska.

I appeared before the Ways and Means Committee of the House d asked that a duty of 2 cents per pound be placed upon pickled rring on the net weight of the fish. As the bill has been reported, has been changed so that it reads one cent and a half a pound on the gross weight of the fish in the container. However, that es not change the amount.

Senator McCUMBER. Would that be a greater or a less amount on the fish content?

Mr. THOMAS. That would be the same as was asked, so far as the rrel and contents that we use in Alaska is concerned. It might t be so with respect to some barrels. We use heavy wood out re, and we find that the barrel and the contents weigh about 100 unds, so that the duty would be about the same. I do not know y that change was made. I have no remarks to make on that re.

I am here merely to ask that the duty as proposed by the Ways and Means Committee stand, in order that the industry, as started in Alaska, may continue to develop.

I am speaking now as a producer, as one who has every cent that he has invested in the industry in Alaska.

Our plant represents an investment of about a quarter of a million dollars. I wish to say in that connection that the investment there is largely the result of solicitations on the part of this Government through the Bureau of Fisheries and the Food Administration.

During the war importations of these fish were largely, if not altogether, shut off, and so the Government sought a supply, and they found the fish in Alaska. They found a fish that met the needs in every way, as to quality, size, etc. The fish have met with great favor in the American market, and the industry has grown very rapidly during the war.

Senator DILLINGHAM. Of what kind of fish are you speaking now

Mr. THOMAS. Herring.

Senator WATSON. Are you satisfied with this provision just as it is

Mr. THOMAS. Yes, sir.

Senator WATSON. Is there anybody who objects to it?

Mr. THOMAS. I think there will be; yes, sir.

Senator McCUMBER. Do Norway, Sweden, and Denmark expo any of these fish?

Mr. THOMAS. Yes. Our principal competitor, however, is Scotland

Senator McCUMBER. There has been some objection upon the pa of others.

Mr. THOMAS. Yes.

Senator SMOOT. What you want to do is to strike out the wor "immediate container and the brine, pickle, and salt."

Senator McCUMBER. That would leave it too low for protection.

Mr. THOMAS. I meant to say that a cent and a half upon the gro weight of the fish is practically the same as 2 cents on the net weig of the fish. I suppose the object of the change was to obviate t necessity for weighing the contents.

Senator McCUMBER. The real question is the duty upon the fis

Mr. THOMAS. Yes.

Senator McCUMBER. And whether one cent and a half per pou on the fish themselves is sufficient.

Mr. THOMAS. It is not.

Senator McCUMBER. In other words, you ask that "immedia container and the brine, pickle, and salt" be stricken out, so that cents will apply only to the net weight of the fish?

Mr. THOMAS. I do not know what others may ask, but in ord to exist in Alaska and to develop this industry we have to ha 2 cents a pound.

Senator McCUMBER. You think that you can not exist on cents per pound?

Mr. THOMAS. No. It costs us to lay down a barrel of fish, cons ering the transportation from Seattle to Boston, $6.50, and t freight down the coast of Alaska from the packing plant is $1.50

Senator LA FOLLETTE. What does the product sell for per pou

Mr. THOMAS. The price ranges from $15 to $17 per barrel.

Senator LA FOLLETTE. And there are about 100 pounds in barrel?

Mr. THOMAS. No; 250 pounds.
Senator LA FOLLETTE. Two hundred and fifty pounds in a barrel?
Mr. THOMAS. Yes; 250 pounds.
Senator LA FOLLETTE. What did you say the price is per pound?
Mr. THOMAS. $15 to $17 per barrel for a barrel of 250 pounds net weight. That has been the price this year.
Senator WATSON. You say that the rate from Seattle to Boston is 6.50 a barrel?
Mr. THOMAS. Yes, sir.
Senator WATSON. By rail?
Mr. THOMAS. Yes; in a refrigerator car.
This is a mild-cured product, and it has to be handled in a refrigerator car. It can not be shipped in an ordinary car.
Senator LA FOLLETTE. It is caught by seining?
Mr. THOMAS. Yes; seining almost entirely, in Alaska.
Senator LA FOLLETTE. And it is caught in great quantities, is it?
Mr. THOMAS. Yes; in large quantities.
Senator LA FOLLETTE. Where is your factory?
Mr. THOMAS. Port Ashton, Prince William Sound.
Senator CURTIS. Are other people engaged in this industry?
Mr. THOMAS. There are six plants.
Senator CURTIS. How many people are employed?
Mr. THOMAS. About 500 this year, I should say.
Senator CURTIS. Is this the industry that a former Secretary of Commerce appeared before the Appropriations Committee in behalf of and asked for an appropriation?
Mr. THOMAS. Yes; this is the industry.
Senator MCCUMBER. How much capital is invested in the industry?
Mr. THOMAS. About a million dollars.
Senator MCCUMBER. Are there any further questions? Is that all you wish to say?
Mr. THOMAS. Yes; that is all. I thank you.

STATEMENT OF GEORGE E. WILLEY, BOSTON, MASS.

Senator MCCUMBER. State your name and address for the record.
Mr. WILLEY. George E. Willey, 220 State Street, Boston, Mass.
Senator MCCUMBER. You wish to speak on the same subject as these other gentlemen?
Mr. WILLEY. I wish to speak on items in paragraphs 720 and 721.
Senator MCCUMBER. Proceed in your own way.
Mr. WILLEY. Mr. Chairman and gentlemen of the committee, I did not know until last night just what the conditions were, and after talking it over after my arrival yesterday, we thought it best not to take too much of your time, so that a number have asked me to present their case and I shall try to do so as briefly as I can, bringing out those points and facts which I can verify by statistics.
Senator MCCUMBER. So that we may understand your testimony better, I will ask you if you represent producers of fish in this country, or importers, or both?
Mr. WILLEY. Both producers, importers, and dealers; in fact, I was going on to say that I am representing myself, from Boston, the Boston Fish Commission Dealers' Association, the Preserved and

Salt Fish Dealers' Association of New York, the Philadelphia Salt Fish Dealers' Association of Philadelphia, the Mid-West Salt and Canned Fish Association of Chicago, and a vast majority of salt-fish dealers throughout the United States, and many producers on the Atlantic coast of this country.

We hereby respectfully protest against the high duty proposed in the Fordney bill as passed by the House of Representatives on June 29 on mackerel and herring, which ranges from 42½ to 67½ per cent ad valorem, as per paragraphs numbers 720 and 721.

I may give you a little of the history of the tariff on herring and mackerel. Salted and pickled herring and mackerel are on the free list under the present law. They furnish an economic and nutritious food for the people of the middle classes and more especially for the poor, and in certain sections of the country herring is one of the principal articles of diet. There are many reasons why these products should have been left on the free list if the economic necessities of the Nation in any way permitted it. Under the previous tariff herring were dutiable at the rate of one-half cent per pound net weight; that is, the weight of the fish exclusive of the container and of the brine, pickle, and salt, equivalent to $1 to $1.25 per barrel, while mackerel paid a duty of 1 cent per pound of net weight equivalent to $2 a barrel. The standard net weight of a barrel of mackerel is 200 pounds of fish and of herring 200 to 250 pounds of fish.

It is now proposed in paragraph 720 to increase the duty on herring at the enormous rate of more than four times the former duty by imposing a duty of 1½ cents a gross pound; that is, including the weight of the immediate container and of the brine, pickle, and salt, which means a duty of $5.25 per usual or standard barrel of the gross weight of 350 pounds.

Senator SMOOT. If the words "including the weight of the immediate container and the brine, pickle, and salt" are stricken out, will that be satisfactory?

Mr. WILLEY. No, sir.

Senator SMOOT. What rate do you want?

Mr. WILLEY. We want 1 cent a pound on mackerel.

Senator SMOOT. And one-half a cent a pound on herring?

Mr. WILLEY. Yes; one-half a cent per pound on herring. The duty on mackerel is likewise fixed at 1½ cents a gross pound, which means a duty of $5.40 a barrel on the customary weight of 360 pounds gross. In this connection we may state the salt and brine have no commercial value, but merely preserve and keep the fish in edible condition. The brine and salt are heavier than fish, and a barrel, say, with 150 pounds of herring and filled with brine would weigh more than the same barrel packed with 200 pounds of herring and the balance brine.

A duty of $5.25 on a barrel of herring is equivalent to about 65 per cent ad valorem—the average price of a barrel of herring being $[illegible] per barrel—an unheard of rate when applied to articles of food for the people and not of course in any sense a luxury, whereas caviar, the highest-priced delicacy of the fish line, only bears in the proposed bill a duty of 28 per cent. A duty of $5.40 on a barrel of mackerel is equivalent to about 42½ per cent ad valorem, the average [illegible] price being $12.70 per barrel. Certainly also a very excessive rate on an article of food. The above duty is limited to herring and mackerel packed in containers weighing with their contents more than

ounds. It may be observed as an added circumstance not easily cplainable that by paragraph 721 a duty of only 20 per cent ad alorem is assessed on fish by whatsoever name placed in containers eighing less than 30 pounds.

Senator SMOOT. Are you objecting to the rate in paragraph 721?

Mr. WILLEY. No, sir.

Senator SMOOT. It is just paragraph 720 that you want decreased?

Mr. WILLEY. I am coming to that a little later.

Senator SMOOT. I wanted to mark it on my paper so that I would now.

Mr. WILLEY. Pickled herring and mackerel have always been nown as a poor man's food. The proposed increase is an injustice this large public consuming these food necessities to a value of pproximately $9,000,000 a year, while the proposed duty on food ixuries is much lower.

We do not believe that it is the sense of this administration that ie luxury foods for the rich should be assessed an average duty of 5 per cent and that the laborer should pay 42½ to 65 per cent on the ods which must be imported because they can not be produced in ifficient quantities in this country to satisfy the consumptive emand.

There is little or no competition between the imported and the omestic product due to the inherent characteristics of the imported sh and the limited quantities under any circumstances obtainable the domestic. Herring coming from foreign countries vary from ie domestic product in quality, due to the difference in the feeding ounds and the temperature of the water and other circumstances.

It has been said by those who have asked for a higher duty on erring that it should be placed thereon in order to protect the idustry of herring catching, packing, and curing in Alaska, and to me extent on the coast of Massachusetts and Maine, but we re-ectfully beg to point out to you the fact that while the production Alaska of pickled herring for food has increased materially since 917, owing to war conditions, it is a positive and uncontradictable ct that only a very small proportion of the herring pickled and sold Alaska are suitable for the table or can be considered a fair com-etitor with the European fish, and that for this small proportion laska has, since the inception of this industry there and up to this ery date, been able to find ready and willing buyers at their own rices, which are fully equivalent and in many instances higher than ie prices for similar qualities of the foreign cure.

Senator MCCUMBER. Did I understand you to say that the fish are ot fitted for the table?

Mr. WILLEY. The larger portion; yes.

Senator MCCUMBER. Then, how is it ever fitted?

Mr. WILLEY. They have been put in oil and fertilizer.

Senator MCCUMBER. It is not shipped out at $8 a barrel from laska as a fertilizer, is it?

Mr. WILLEY. They would not bring it here. They might ship it own, but it would not prove suitable.

Senator MCCUMBER. If it is not suited for table use, what use is iade of it?

Mr. WILLEY. That which comes here now is fitted for the table.

Senator LA FOLLETTE. You mean that a considerable portion of each catch is not suitable for food and that portion must be separated from the portion that is suitable food?

Mr. WILLEY. It is only during two or three months of the year that the catch of herring is suitable. They can not compete with the foreign product. They run smaller in size and not so fat. When they do obtain herring that are fat enough they have a good market for them and they bring high prices.

Senator LA FOLLETTE. Then there is a portion of the year when the food is out of season, is that it?

Mr. WILLEY. Yes.

Senator LA FOLLETTE. Is that owing to its condition—I mean, as to its poor food value?

Mr. WILLEY. With reference to most any kind of fish there are certain seasons of the year when they do not run well. It may be spawning time.

To illustrate this fact that at the present time new salt herring imported from Holland packed in barrels is selling very slowly at 5½ to 6 cents per pound, while new salted Alaska herring is being sold rapidly at a rate of 10 cents per pound as fast as they are produced. The latter herring, therefore, it is clear, does not need any protection.

Senator MCCUMBER. At some seasons of the year this Alaskan product is more valuable than that imported from Holland or from the North Sea?

Mr. WILLEY. At the present time that is true; yes.

Senator MCCUMBER. Is that due to the superior quality of the Alaskan fish?

Mr. WILLEY. Yes, sir.

Senator MCCUMBER. And do you mean to say that that superior quality lasts only two or three months in the year?

Mr. WILLEY. Yes, sir.

Senator MCCUMBER. And then you get an entirely different product?

Mr. WILLEY. Yes. That has been our experience.

Senator MCCUMBER. And the product is not fit for table use at all?

Mr. WILLEY. That has been our experience of the past few years.

As far as domestic herring and mackerel are concerned—and I refer now to the Atlantic coast fisheries—we beg to point out to you that neither mackerel nor herring is ever salted and pickled except in such cases as when the supply of fresh fish exceeds the demand for fresh fish or the facility for freezing fish, and in those instances only are mackerel and herring offered and sold to curers for salting and pickling purposes except in a few instances where they have freezing facilities, and the market prices for these fresh fish are usually considerably higher than for such as are used for salting purposes. We also beg to point out to you the fact that as you will see on the statistics attached hereto the production of mackerel available for salting and pickling purposes in the United States has decreased year by year in a very heavy measure. In 1878 the United States produced 196,468 barrels. In 1884, which was the largest year of production on record, 478,076 barrels; while in 1920 only 4,897 barrels and in 1921 but 3,200 barrels were produced and packed.

Senator McCUMBER. In other words, about one-tenth?

Mr. WILLEY. Yes; and this season, which will be practically over i September, it will amount to about 3,200.

The total American consumption of salted mackerel averages oout 100,000 barrels annually. The explanation of the aforesaid eat decline in production of mackerel in the United States is due the absence of the fish in our waters. The captains of the vessels igaged in this branch of the industry repeatedly state that they ive never traveled over so much territory and seen so few fish as in ese past few years. We further attach statistics furnished to the ays and Means Committee as published in Tariff Information of 21, No. 16, dated January 24, 1921, pages 1761–1762, which figures ll show that the importation of herring has at all times been conlerably larger than the production in this country of pickled and lted herring for food.

Senator SMOOT. Your 15 minutes have expired. If you will give e the percentages for paragraph 721 I can mark them down on this eet.

Mr. WILLEY. I shall be glad to do that.

Senator SMOOT. I mean in connection with the House duty named paragraph 721. If you will tell me what changes you want, I ould like to have them now.

Mr. WILLEY. Those that I referred to were statistics as to quanies.

Senator SMOOT. I thought you could say whether 26 per cent on h, except shell fish, packed in oil or in oil and other substances, is at you are asking.

Mr. WILLEY. We are asking one-half a cent per net pound on rring and 1 cent per net pound on mackerel.

Senator McCUMBER. Is it your contention that the Alaskan fish the few months it is selling for 10 cents has no competition?

Mr. WILLEY. No, sir. I consider that they have hardly any comtition. They sell themselves as they are produced.

Senator McCUMBER. And the portion that is produced in the other e months of the year is not edible?

Mr. WILLEY. That portion is not suitable for people who use this ss of herring.

Senator SMOOT. There is a class of people that uses it?

Mr. WILLEY. Not that I know of; at least, not for food purposes, less it is shipped, perhaps, to some foreign countries.

Under paragraph 721 we would respectfully petition that the e of duty on salt, pickled, or green fish be 1 cent per pound, our sons for the same being that we do not produce certain grades fish under this class to anywhere near supply the demand and that st of the larger producers of codfish in the States have to rely l purchase them from foreign sources to supply their demand, l compared with the rate as is now proposed for boneless fish, it nore in line, for otherwise it would have a tendency for the procers on foreign soils to manufacture their product themselves it would be a comparatively lower rate of duty in this manner, l as can readily be seen this would be an injustice to our Ameril labor here.

Senator SMOOT. Is that in bulk or in containers?

Mr. WILLEY. That is in bulk; yes.

The imposition of the additional duty would tend to decrease the use of fish as an article of food. The consumption of fish in the United States is 19½ pounds per capita per annum; in England 45 pounds, and in Continental Europe 100 to 130 pounds. It would seem that instead of curtailing the supply of fish by heavy and prohibitive duties, it would be well for the health and economy of the nation to promote the same as much as possible. If we could obtain sufficient supplies of suitable fish in this country we would much rather do so than handle the foreign products, thus eliminating the many risks and troubles that arise in dealing with the countries on perishable commodities such as ocean transportation, fluctuations in exchange, and slowness and uncertainty of mail communication, and the frequent difficulities experienced in making proper adjustments with foreign shippers, when shipments do not grade up to standard.

The proposed duty will tend to destroy, if not entirely, all importation of herring and mackerel. If importation be stopped no revenue would be produced on this particular article, while if assessed with a reasonable amount of duty the consumption would be sure to continue, and in that way the revenue would come into the Treasury instead of being eliminated by stopping the importation. The proposed duty would deprive a large part of the population of the country of a necessary and customary article of food, or at least very materially increase its cost; it will not benefit American labor, as the cost of pickling is no lower in exporting countries than in America, but in fact appears to be higher. America can not produce sufficient fish of this character to supply the demand, and importation, therefore is a positive necessity; it will seriously disturb the commercial relations of the United States with the exporting fish countries and injure American exports to these countries. It is therefore respectfully submitted that the Payne-Aldrich tariff rates of one-half a cent per net pound on herring, 1 cent per net pound on mackerel, and 1 cent per net pound on codfish are just and reasonable, and that they be restored.

And now, Mr. Chairman, I want to correct, perhaps, some of the statements which were made by an honorable Member from Alaska which perhaps might be misconstrued. He laid great stress on the fact that I was representing importers, which was partly correct but not wholly. As a matter of fact, the importers are a small portion of the associations for which I talked.

I am a producer myself in the East.

On the herring which he spoke about he asked for 2 cents a pound duty. The type and the quality of the herring on which he is asking for that duty is so small comparatively—only about 2 or 3 per cent of the amount of herring used in the United States—and you are going to cut off your importations of thousands of barrels from Nova Scotia, Newfoundland, Scotland, Norway, Holland, and all those countries of hard-cured herring, which are the poor man's article of food to-day.

With that duty, as is proposed, of $4 per barrel on those fish, which :e only worth $5, $8, or $9 a barrel, and with thousands of barrels)ming in here, you will readily see they can not possibly do it. He ferred to paragraph 1645, of frozen herring, as a poor man's article food. I think that paragraph, according to what I have heard, going to be changed. That was put in for the Maine sardine people, id frozen herring is not the poor man's article of food; they never ere, and only can be used in one or two of the coldest months of the ar, and they have never come in competition with the salt herring all; and, furthermore, I would simply like to state that in any riff we have ever had there is always a distinction made between rring and mackerel, because the relative value of herring is not 0 per cent of the value of mackerel.

[Tariff Information, 1921.]

Alaska herring, 1905 to 1920, inclusive.

WORLD'S PRODUCTION OF SALT MACKEREL.

[Compiled by Boston Fish Bureau in annual report of January, 1921.]

The American (New England) catch of mackerel for the past five years has been (in barrels) as follows:

	1920	1919	1918	1917	1916
Fresh	79,799	53,992	63,314	111,932	102,420
Salt	4,897	7,007	13,030	32,162	32,066
Total	84,696	60,999	82,344	144,094	134,486

The condition of the American market for salt mackerel did not encourage the foreign producers, and consequently the catch of mackerel in the foreign countries as a rule has been light.

In Norway the catch improved and was the best since 1914. The catch, however, was about 65 per cent No. 4 and No. 5.

The catch of salt mackerel of the leading countries of the world for 1919 and 1920 has been (in barrels) as follows:

	1920	1919
United States	4,897	7,007
Canada	21,965	35,000
Ireland	45,000	45,000
Norway	22,571	11,173
Total	94,433	98,180

World's catch of salt mackerel (barrels) 1878 to 1920, inclusive.

Year.	United States.	Canada.	Great Britain.	Norway and Sweden.	Total.
1878	196,468	183,919			380,387
1879	220,599	191,448			412,047

STATEMENT OF JENNIE D. HEATH, REPRESENTING THE NATIONAL HOUSEWIVES' LEAGUE.

Mrs. HEATH. Mr. Chairman and gentlemen of the committee, I am very glad that I do not find it necessary to deal in figures, and I know that you are glad, too. The gentlemen who have preceded me have saved me that. Although I have quite a number of figures jotted down, I shall not use them. I was wondering how I was going to remember them, and now I find that it is not necessary.

I want to say to you that I represent here to-day the women who have signed this resolution. It represents the housewives from every State in the Union, I believe. I think that we have not missed one. The signatures are those, as I have said, of housewives.

I am the president of the National Housewives' League, which was organized in 1911, and which has been trying to bring down the cost of living. It has been trying, moreover, to make the women of this country realize that they have a real business, a profession, an industry, that needs the same protection here in Washington that all other industries need and seek. In other words, I am here representing an economic force, the purchasing force of the world. I do not know that it is necessary to tell you, because you undoubtedly know it, but I will say to you now that the women of this country spend 90.75 per cent of all the money that is spent. I assume that you know that.

Senator WATSON. I think you are a little shy on your figures. [Laughter.]

Senator CALDER. Did you say 90.75 of 1 per cent?

Mrs. HEATH. No. I said they spent 90.75 per cent of all the money.

Senator SMOOT. That is the average; some spend more. [Laughter.]

Mrs. HEATH. Some spend more. That is true. I thought of that this morning, particularly when I listened to the discussion on fox furs. I could see some of them spending a great deal more for fine furs.

So, I repeat, that we are an economic force, and that we have been trying, since 1911, to bring that economic force into the body politic.

In securing signatures to this resolution—and I may say that there is but one resolution, so that you need not be frightened—I endeavored to get not only those women connected with the Housewives League but others as well; so that this resolution represents other organizations as well. It is signed by such people as Mrs. Scott, who is an ex-president general of the D. A. R., and others who are working independently of the National Housewives' League.

Away back in 1891—possibly I should not confess to those figures—I was a worker on the East Side in New York City, at that time engaged in settlement work. I dealt with and tried to help the poor people, particularly in the management of their incomes for the sake of the home. At that time my investigations showed that practically all of the troubles in the home came from a lack of knowledge on the part of the housewives as to just how to spend money for the best interests of the home. I am still struggling with that problem of these poor people, and am even engaged in similar problems concerning those of larger income. But it is for these people that I appear here to-day in regard to the fish tariff.

Herring and salt mackerel are used, as you know, very largely by he small wage earner.

Of course you gentlemen know that at this time we are constantly eing reminded that the cost of living is coming down. According o statistics it is coming down. However, I have been, since the ar, making an intensive study of that matter, irrespective of figures, nd I find that prices fluctuate considerably, so that while prices ay be coming down with respect to some articles, as a whole the ownward trend is not very noticeable in the family budget. The esult is that the housewife is at her wits' end to know just how to uy to make ends meet. If she finds that sugar, for instance, is lown, she is sure to find that something else is up. Conditions, so ar as the relief of the family is concerned, seem just as bad as before.

Regarding the people who use this fish, my attention has been pariclarly drawn to them because in many organizations of which I m a member we are doing Americanization work among the foreign orn as well as the Americans. The spirit of bolshevism is rather ife these days. The spirit of unrest prevails. Anything that would nake prices rise should be fought.

I wish to lay before you some facts contained in a letter which I ent out to these people who signed this resolution.

In June clothing increased in price 0.9 of 1 per cent. Food decreased only 0.3 of 1 per cent. All other items remained stationary. The entire decrease, to the average wage earner's family, was 0.2 of 1 per cent, an amount hardly perceptible in its effect upon the home budget. The so-called "decrease in living costs" for the year ended July 1, was 21 per cent, but living costs still remained 61 per cent over July, 1914.

I think all wages are going down. To-morrow or the day after, it may be, the wages of the steel men are to be lowered. So, anything that is going to raise the cost of living is going to create chaos in the home.

These gentlemen appear here asking for a duty on fish, while there are thousands concerned who do not appear here at all. I realize that the consumer should be heard on every single one of these points. Not that I am wise enough to suggest exactly what you shall do in regard to the tariff, but I do think that the consumer should be heard on every one of these points.

I would like to ask the gentleman who spoke before me what the increase in the price of herring would be if the tariff were made as he asked. I was told that it would increase the price 2 cents a pound on the schedule that you have. I do not want to see the price increased at all. Everything is tacked onto the consumer.

This morning a gentleman spoke about soap, fixing a price on it of about 5¼ cents per pound. Then some one of you asked what the consumer would have to pay, and he said 6 cents, or that it might go up to 7.

The retailer does not follow the market, as we all know. The grocery man on the next corner says to you, "Didn't you see that the cost has gone up to 7 cents?" You may have to pay 8 cents. In other words, the retail man does not follow the market.

That applies to the cake which you were so interested in this morning. What the consumer pays is not based on cost of ingredients and labor; it is based on that plus all the consumer will pay.

So I am here to make that protest. I have become so interested in this subject while listening to-day that you will probably have to listen to me again later on.

I do represent, I believe, the only organization which represents just the housewives. I have here a number of names that I would like to submit to you. I would like to have the names put in the record. The resolutions are all the same. I will leave these with you. I would like to have them incorporated in the record and I would like you to know that this is strongly indorsed.

Senator SMOOT. Would it not be just as well to show the number of signers?

Senator McCUMBER. I do not understand that Mrs. Heath wants to print the names of the signers.

Senator LA FOLLETTE. That is just what she does want.

Senator McCUMBER. You want the number, do you not?

Mrs. HEATH. I would like to have them printed. They represent all parts of the country. I think that the housewife, the consumer, has not been here as much as she should be. I would like to have their names printed to show their protest.

Senator LA FOLLETTE. The brief is a very short one. The names are very significant.

Senator McCUMBER. The list is not short.

Senator WATSON. How many are there?

Mrs. HEATH. I do not know.

Senator WATSON. Would there be two or three thousand names?

Mrs. HEATH. A thousand, perhaps. There will be more in a couple of days. They are still coming in.

Senator SMOOT. You can get several thousand if you will send them out.

Mrs. HEATH. The consumers have not yet been called upon to do this thing.

Senator SMOOT. Oh, they would sign it and send it in just as they do with us. I think you can start propaganda for anything in the United States and get a thousand names signed in 30 days.

Senator LA FOLLETTE. I think that we would have considerable trouble to get a thousand names signed to a petition to increase the cost of living.

Senator McCUMBER. Every consumer is a producer of something and that producer has to sell his product. We have to consider the consumer as well as the producer and the producer as well as the consumer; their interests are concurrent. They all want to live.

Mrs. HEATH. I agree with you fully. I have made quite a study of economics. I think we need protection, but I think also that we want to see competition.

You remember just a little while ago a gentleman spoke about the butter market having been broken in 1911. I had the honor of starting that boycott. The price fell to 26 cents. A telegram came in saying that the price had broken because the consumers refused to buy.

A somewhat similar situation existed with reference to the egg market.

Last year the price of butter was held down because we knew that the Danish butter was coming in and we used Danish butter. It was cheaper than the other and in no way inferior.

We do need this competition. This whole country was built upon mpetition. I think that we should more than ever take a world's ewpoint. We now buy from an international larder; that is, we y from all over the world. We want competition and we need it. ie price of eggs went down on account of imported eggs; the price butter on account of Danish butter.

I have studied the tariff question rather carefully. I know that do need some protection, but the cost of living must not go up.

Senator McCumber. I think you can assume that the present pression in business all over the country is due to the voiceless tests of the people who have had to pay too high prices for everyng.

Mrs. Heath. I will leave this with you gentlemen. I thank you y much for listening to me. I wish that you would consider this the housewives' protest.

ATEMENT OF HON. DAN A. SUTHERLAND, DELEGATE IN CONGRESS FROM THE TERRITORY OF ALASKA.

enator McCumber. I believe you desire to speak on paragraph ?

Mr. Sutherland. I desire to speak on paragraph 718 and I want ay also a few words in regard to paragraph 720.

want to correct the impression which may have been made by the tleman here representing the Boston importing interests. I want ell you that herring are herring the world over, whether it is ing for packing or seasonal fish. At certain seasons they are pred for salting and packing. The Alaska herring is the same as the ing of Norway and the herring of Scotland.

n speaking of the amount consumed by fertilizing plants, the ka herring is seined, and consequently all sizes are caught in the e. The Scotch herring is gill netted. The small fish pass through net, and the large ones are caught and packed; consequently the ormity of size.

enator McCumber. It is the same herring caught at all seasons of year, but different in character.

r. Sutherland. They are not caught at all seasons. There are certain seasons of the year when they are suitable for packing.

nator McCumber. It is also the same herring that is used for r purposes?

r. Sutherland. Exactly. In certain sections of the ocean the ing are of better quality than in other sections. You get down he south toward Puget Sound and southern Alaska and they mall and of inferior quality, but when you get up to the Gulf, in ame latitude as Scotland, you get as fine a quality as there is there in the world. A little farther north into the Bering Sea have the largest herring in the world, a magnificent fish, but it large for the market. It does not seem to be suitable.

nator McCumber. What have you to say as to the herring of ka bringing a much higher price.

r. Sutherland. I do not know that they bring any higher price the finer qualities of Scotland. They are equally as good. I ot claim they are any better, but there are men here representing

the importing interests who will tell you they are selling on the New York market as readily as the best quality of the Scotch fish.

Senator McCUMBER. The preceding witness stated they sold at a much higher price.

Mr. SUTHERLAND. I think he was speaking of just the present time. I think he is speaking of local Atlantic fish, and possibly some Holland fish. It may be the Alaska herring coming in now are a little better than those foreign fish.

Senator McCUMBER. I understood him to say they were so much superior in quality that the foreign fish were not really a competitor.

Mr. SUTHERLAND. I did not quite understand it in that way, but I may not have listened very closely. I think they are equally as good and possibly a little better than any others.

This mild-cured fish is quite an expensive fish to prepare. It has to be placed in refrigerators and transported to market and kept in refrigerators to be sold. I do not concede that it is a poor man's food. These mild-cured salmon and herring have become a luxury, and before the war the mild-cured salmon was exported to Germany and was considered a very great table delicacy in that country.

Now, the gentlemen who have spoken to you in all cases seem to represent the importers, manufacturers, the middlemen. You will notice on the metal schedule not a man appeared who is representing the ore interests. I want to represent the producers' side. The fishermen of Alaska are endeavoring to build up the industry and they hope to be protected under the theory of protecting an infant home industry.

Now, under this bill Capt. Thomas or any other herring producer in Alaska has to pay a duty on each and every one of the materials he uses in his business—his salt, his anchors, his cordage, every thing he uses, a duty is fixed in this bill. To the man who catches the herring, in the case of his flax twine a duty of 56 cents a pound is provided, and in addition a 10 per cent ad valorem duty, but when he imports his product the importer still seems to object to a reasonable duty that will enable him to produce and bring to the market. On the cotton product he uses I want to read into the record the prices the Alaskan producer of fish has to pay for ordinary cotton twine used in his business, and to show the increase during the past two years, and that the price is greater than ever in this month of August, 1921.

Senator McCUMBER. Twine used for what purpose?

Mr. SUTHERLAND. For fishing. It is one of the largest items of expense. It is used in making the seines and traps.

I have talked with the Alaska cannery men, and they do not understand why they have to pay the prices they do for this twine used in their fishing gear.

In 1917 they paid 34.7 cents a pound, in 1918 they paid 48.5 cents a pound, in 1919 they paid 71.3 cents a pound, in 1920 they paid 79.5 cents a pound, and in this month of August, 1921, the 1st of August, they paid 83.5 cents a pound.

Now, that is the way it has increased, and it has not declined. Their cotton, their raw material, is on the free list, and they do not understand that. A duty does not affect it to that extent, and a duty would not affect it to that extent. It means that the

mbination somewhere that exacts this exorbitant price from the rmen of Alaska and other sections.

nator SMOOT. Have you looked it up to find out whether it is nanufacturers, wholesalers, or retailers?

r. SUTHERLAND. No; I have not as yet, Senator. I intend to it up with the Federal Trade Commission. It came to my ition quite recently from a large Alaska packer. He sent me statement of the prices he was paying for his cotton twine. He large user. I do not know the amount he would use, but he d be one of the largest contractors on the coast and would use ge quantity. I think next to labor it is the largest expense have.

nator DILLINGHAM. Do they make their own nets?

. SUTHERLAND. No; these are knit. There is a manufacturing ss it goes through, but it is a very simple process. It is not an nsive process. I understand with the machinery they have that perative can do about as much as 25 or 30 did with the old hand ods.

nator McCUMBER. Are those nets and seines made in Alaska?

. SUTHERLAND. They are made up in webbing. The webbing s in square yards, great rolls, perhaps a hundred fathoms long.

nator DILLINGHAM. And they are paying 83 cents a pound for it?

. SUTHERLAND. Yes. I am calling your attention to the increases g these years, and to the fact that when materials are supposed declining this is higher than it was at any other time.

nator SMOOT. Are the prices named upon the same size of ds?

. SUTHERLAND. Yes. He is speaking of all the same size.

nator SMOOT. If it is all the same size then there is an increase, hat letter could be absolutely true and yet not be out of pro- n to the value of yarn, according to the number and size.

SUTHERLAND. Yes; but they use a uniform size for salmon ing.

nator SMOOT. We have many statements made that on their re true, but when you examine into them you find there is feature like that that has a great bearing upon them.

ator LA FOLLETTE. Are those the wholesale prices?

SUTHERLAND. It would be considered wholesale; yes. Those e prices they have to pay, and they have large deliveries, and robably have bids furnished by brokers or manufacturers.

ator LA FOLLETTE. It is all large quantities?

SUTHERLAND. Yes, sir. The point is that Alaska has herring finest quality sufficient to supply the world, to supply this t in the United States, that I understand is consuming about million barrels a year. This mild-cured fish is not used gener- hroughout the cities of the East. The fish of the poor people rided for in the bill, the frozen herring, which comes in free of That is marketed in the cities on the Atlantic coast. This ured article is consumed by the foreign element. The Jewish of Russia are great consumers of mild-cured herring.

ator McLEAN. What do they retail for?

SUTHERLAND. In cities?

ator McLEAN. Yes.

SUTHERLAND. I believe about 20 or 25 cents a pound.

Senator McLEAN. It costs them 8 cents or less delivered in N York and retails for 20 to 25 cents?

Mr. SUTHERLAND. I think that is a pretty low figure. I think fact is that when this fish is delivered from Alaska to New Y stands them about $20 a barrel. The freight across the conti is $6.66. The freight from Alaska down is $8 a ton; about $1 barrel.

Senator McLEAN. That would be 8 cents a pound, would it no

Mr. SUTHERLAND. Yes; that is true.

Senator McCUMBER. To what extent does Alaska produce fish fertilizing?

Mr. SUTHERLAND. Perhaps I should have spoken of that. W they catch a load of fish in the seine they select the uniform packing and mild curing and the balance are used in fertil plants.

Senator McCUMBER. They use good edible fish for fertil purposes, do they not?

Mr. SUTHERLAND. Small-sized fish, Senator, but not for ferti I think very little is used for that purpose. They manufactur for feeding chickens. It is called "chicken meal." It is product that looks very much like meal.

Senator McCUMBER. That is considerable of a waste, is it no

Mr. SUTHERLAND. If you could see the innumerable herri Alaska waters, you would not view it that way.

Senator McCUMBER. We used to see that with the codfish East, but you do not see it any more.

Mr. SUTHERLAND. Yes; that is true.

Senator SUTHERLAND. To what extent are good edible fish used for oil, and being destroyed?

Mr. SUTHERLAND. There is one oil-manufacturing plant coast. It consumes quite a few herring.

Senator McCUMBER. What fish do they use?

Mr. SUTHERLAND. Largely herring, with a few salmon.

Senator McCUMBER. I understood some years ago that the used for oil represented an enormous amount or number.

Mr. SUTHERLAND. There are relatively few. They catch in the herring seines.

Senator McCUMBER. I understood that depleted the salmon

Mr. SUTHERLAND. That is not the great cause of the dep of the salmon. The cause of the depletion was overfishing fo mercial purposes, for canning. That is the cause of the dec in the supply of salmon.

Senator SMOOT. Why do they not catch their herring m the same as they do in Scotland, and let the little fish go? T ruin the industry up there if they continue the way they ar catching all those little fish and using them for fertilizing.

Mr. SUTHERLAND. Senator, on the coast of Norway th great number of oil and fertilizer plants. I would say there ens of them. I do not know just the number, but many tim number in Alaska. They have been there for years and years facturing herring into fertilizer, and it does not seem to depl supply to any extent.

Senator WATSON. Did you say there was some sort of herr does not come within the provisions of this act, coming in fro

SUTHERLAND. Frozen herring are on the free list.
tor WATSON. Is that the kind that the lady who preceded luded to, that is used largely in New York City?
SUTHERLAND. That is used in New York and Philadelphia ston and Baltimore. It makes a fine cheap food for the people e cities.
nt to speak a word on paragraph 718. I want to ask that it nded to read as follows——
tor SMOOT. What do you want in 720?
SUTHERLAND. I want it to remain just as it is. I think we are l to that duty. If you want to encourage the pickling of in Alaska it will require that duty. That duty was conceded representatives from Massachusetts. They have agreed that ty is acceptable to the people of Massachusetts, representing w England fishing industry.
tor CURTIS. I would suggest, if this witness is to be heard on ubjects, that as he is here in the city it might be well to let me later, and to hear some of these men from outside the city. not inconvenience the Congressman any.
SUTHERLAND. I have just one other subject, but I will be accommodate the committee in that respect. I am going ere in the city.
tor CURTIS. Go ahead. I thought you had several other s to refer to.
SUTHERLAND. I transacted my business with Mr. Lufkin, of ster, supposing he represented the fishing industry.
tor SMOOT. He might have said that in respect to his section, re were others that did not agree.
SUTHERLAND. I do not know about that. I assume the husetts delegation were agreed on it, from my conversation r. Lufkin.
going to ask that paragraph 718 be amended to read as

t, fresh, frozen, or packed in ice, 2 cents per pound; all other fish, fresh, packed in ice, not specially provided for, 1 cent per pound.

or SMOOT. Would this be satisfactory to you?

t, salmon, or swordfish, 2 cents per pound.

UTHERLAND. Yes; that is acceptable to me.
or SMOOT. What you want is halibut at 2 cents a pound, do not object to salmon or swordfish at the same rate?
UTHERLAND. I do not know anything about swordfish, but I objection to salmon. Halibut is the highest priced fish on ket. As compared with others, the price is away beyond Then, again, the price fluctuates all the time, and I am going have an administrative section placed in the bill, in connec- the increased price of halibut, to read as follows:

sh or fish products, except iced fresh fish, shall be shipped in bond through ntries into the United States, except it be treated and prepared for ship- ited States territory, and such iced fresh fish shall not be transported in gh foreign countries into the United States, except it be the product of es fishing vessels which are registered and outfitted at ports of the United the product of fishing vessels that purchase gear, fuel, and supplies at in excess of the amount required to reach a port of the United States shall foreign fish and liable to the duty provided for in this act.

I do not know just what language you will want to incorp[illegible] the bill, but that is the suggestion.

American vessels are landing their fares at Prince Rupert, [illegible] the Pacific coast terminal of the Grand Trunk Pacific Railroad [illegible] into the United States duty free. But when fish become dut[illegible] question might arise as to just how far they can go in shipp[illegible] a Canadian port. I have no doubt they would be allowed [illegible] leges they have been in the past. In fact, the Canadians [illegible] glad to have them, but I would not want American fishing [illegible] be simply American so far as registry is concerned and pur[illegible] their supplies and transacting all their business at a Canad[illegible] That is why I asked to have that paragraph placed in the bill [illegible] that they may continue to purchase their supplies in American [illegible] At present they can do as they please. The British C[illegible] furnish them with fishing supplies, food, and fuel, but if a [illegible] placed on their product I think they ought to get their supp[illegible] American ports.

Senator WATSON. Do you propose to cover in a protec[illegible] the frozen herring now on the free list, that are shipped i[illegible] people of New York?

Mr. SUTHERLAND. No, sir.

Senator WATSON. Paragraph 718 says. "All fish, fresh, [illegible] or packed in ice, not specially provided for, 1 cent per pound.

Mr. SUTHERLAND. "Not specially provided for." Tha[illegible] specially provide for them.

Senator SMOOT. Paragraph 1645.

Mr. SUTHERLAND. This matter of the bonding of Americ[illegible] landed by American vessels at Prince Rupert I presume is g[illegible] involve some legal questions.

Senator SMOOT. I do not think it can be done.

Mr. SUTHERLAND. And it is for the committee to decide [illegible] can be done.

Senator SMOOT. It could not be done.

Mr. SUTHERLAND. If I can give you any information re[illegible] conditions up there I will be glad to.

Senator SMOOT. You want a provision as to American fish [illegible] in American ships through a foreign country?

Mr. SUTHERLAND. Something similar to the suggested pa[illegible] I read to the committee.

BRIEF OF HON. DAN A. SUTHERLAND, DELEGATE IN CONGRESS FROM T[illegible] TERRITORY OF ALASKA.

It is respectfully urged that paragraph 718 of H. R. 7456 be amended [illegible] follows:

"Halibut, fresh, frozen, or packed in ice, 2 cents per pound; all other [illegible] frozen, or packed in ice, not specially provided for, 1 cent per pound."

The following reasons are submitted for a higher duty on halibut tha[illegible] fish:

First. The halibut is the highest priced deep-sea fish in the America[illegible] The average price paid for halibut at the port of Seattle, Wash., the large[illegible] market in the world, during 1920 was 17½ cents per pound. This is a[illegible] cent more than the average price from the vessel of cod, haddock, hak[illegible] market fish. This price (17½ cents per pound) is much higher than th[illegible] for salmon, except in the case of the small quantity of Atlantic salmon imp[illegible] Canada.

;econd. The American halibut fisherman of the Pacific coast competes in the ierican market with the Canadian halibut fisherman. There is virtually no com-ition in the halibut market of the Atlantic coast. The Pacific coast produced 1920 50,000,000 pounds of halibut and the Atlantic coast produced 4,000,000 inds in the same year.

'hird. The American market for halibut should be preserved for the American erman. The proposed duty would encourage the development and increase of nage of the American halibut fleet. It is very doubtful if the future supply of ibut will be any larger than the present supply.

;y reason of the depletion of halibut banks adjacent to the Pacific coast of British umbia and southern Alaska, these fish must be sought for on remote banks of the :ific in the vicinity of the Aleutian Islands and in Bering Sea, and thus the greater t of the halibut of the future will come from waters contiguous to American territory, : a protective tariff will tend to encourage Americans to engage in the halibut ery and thus industry and consequent population will be added to western Alaska. ry year the halibut-freezing industry is moving westward on the Alaskan coast. 'eezer will operate at Port Chatham, near the entrance to Cooks Inlet, this season, a few more years will find them operating at Kodiak Island and even farther west. t is respectfully urged that the following administrative provision be incorporated I. R. 7456 for the regulation of American fishing vessels landing their fares at alian ports:

That no fish or fish product except iced fresh fish shall be shipped in bond through ign countries into the United States except it be treated and prepared for shipment Jnited States territory, and such iced fresh fish shall not be transported in bond ugh foreign countries into the United States except it be the product of United es fishing vessels which are registered and outfitted at ports of the United States, the product of fishing vessels that purchase gear, fuel, and supplies at foreign ports xcess of the amount required to reach a port of the United States shall be deemed ign fish and liable to the duty provided for in this act."

lmost one-half of the Pacific catch of halibut is now landed at Prince Rupert, ish Columbia. Both American and Canadian vessels land their fares at that port, it is held by the Bureau of Fisheries that 80 per cent of the Canadian catch comes he American retail market.

he Canadian Government, through its elastic system of formulating laws and ilations by orders in council, has in the past granted such concessions to American ermen as would tend to draw commerce to the port of Prince Rupert and thus add age to the traffic of the Grand Trunk Pacific Railroad, of which Prince Rupert is Pacific terminal point.

continuation of the present policy of Congress in admitting fresh fish to the United es free of duty will serve to build up the Canadian fishing fleet and increase the ing population of British Columbia, while the American fishing tonnage will be portionately lessened and the Alaska fishing population will decrease.

respectfully submit that in view of the fact that Canada is striving to develop fisheries on the Pacific by selling in the American market, it is only fair and just merican fisheries that the Congress take steps to protect and encourage them in prosecution of their industry.

Halibut landed at Pacific and Atlantic ports, 1920.

	Pounds.

SMOKED HERRING.

[Paragraph 719.]

STATEMENT OF HON. FREDERICK HALE, UNITED STATES SENATOR FROM MAINE.

Senator HALE. Mr. Chairman, at the request of some of the herring packers of Maine, I would like to introduce an amendment to paragraph 719 of H. R. 7456. The amendment reads as follows:

On line 3, page 88, after the words "ad valorem" insert the words "smoked herring, skinned or boned, 2½ cents per pound." In line 5, page 88, strike out the wo "including herring skinned," so that the paragraph will read, "salmon, pickled, salted, smoked, kippered, or otherwise prepared or preserved, 25 per cent ad valorem; finan haddie, 25 per cent ad valorem; smoked herring, skinned or boned, 2½ ce per pound; fish, dried, salted or unsalted, 1¾ cents per pound; fish, skinned or bone in bulk or in immediate containers weighing with their contents more than thi pounds each, 2½ cents per pound, including the weight of the immediate contain with the contents."

The CHAIRMAN. How much increase do you ask over the Ho rate?

Senator HALE. I do not think it is increased at all. I think t House intended to take care of the matter in their bill.

The CHAIRMAN. You put in the salted fish that are not——

Senator HALE. No; it does not touch anything except herri skinned or boned. The House bill provided 2½ cents per pound fish, skinned or boned, including herring, skinned, in bulk, or in imm diate containers weighing with their contents more than 30 pou each. These fish are never brought into this country in contai of that size; they are brought into this country in containers wei ing 10 pounds, so that the duty does not apply to them at all.

The CHAIRMAN. Then, you desire to make a technical correcti

Senator HALE. Yes, sir.

Senator McCUMBER. But you want to include the weight of container and the salt and the brine and everything as a part of weight of the fish?

Senator HALE. That has nothing to do with these fish. If it is fi as I suggest, the weight of the container will have nothing to do w it; it will simply be a flat duty of 2½ cents on smoked herring, skin or boned, and that, I think, was the intention of the House co mittee.

Senator McCUMBER. Is not that the provision that Minnesota North Dakota, as well as Norway, Sweden, and other Scandinavi countries, were protesting against?

Senator SMOOT. No.

Senator HALE. There is a provision now for a tariff on smoked h ring of 20 per cent ad valorem, when they come in containers of l than 30 pounds, but this will be entirely left out, and this is a furt process of manufacturing, beyond the process of smoking, and they would come in free. I think it is simply a question of a mist on the part of the committee.

Senator SMOOT. I agree with you that the change will make paragraph very much better, and really it is lowering the duty fr what the House has.

The CHAIRMAN. Senator Fernald, have you anything to add?

Senator FERNALD. No; that is all, I think. I am interested in same proposition.

CRAB MEAT.

[Paragraph 722.]

'ATEMENT OF HON. WESLEY L. JONES, UNITED STATES SENATOR FROM WASHINGTON.

Senator JONES of Washington. In reference to paragraph 722, prosing a tariff on crab meat of 26 per cent, I have received some ters from some of our people stating that they understand that ere is strong opposition to this tariff, and they urge its retention.

I have here a letter from the Stuart Co. (Inc.), of Seattle, setting t their reasons for this tariff's being retained. I would like to ve that letter put into the record.

Also, I have a letter here from Mr. John N. Cobb, director of the iiversity of Washington, College of Fisheries, urging the same ing. I would like to have that put into the record.

Senator McCUMBER. Is the supply holding out on the west coast?

Senator JONES of Washington. He says that with proper encourement the industry can be developed very greatly out there.

Senator McCUMBER. What kind of encouragement?

Senator JONES of Washington. He says that this 26 per cent iff——

Senator McCUMBER. That certainly would not encourage the protion of the crab at all; rather, it would have the opposite effect, uld it not?

Senator JONES of Washington. No; I think not, Mr. Chairman. ey would propagate the crab much more extensively if they knew it the industry could be maintained and foreign competition, which largely Japanese, is restricted. If the tariff is taken off, the crab, far as our section of the country is concerned, will very likely dispear, because it will not be propagated.

Senator McCUMBER. We know that the lobster is disappearing very idly from the eastern waters, and I assumed that probably the eater number brought in from a foreign country would naturally serve those that we have; but I do not know. There may be so ny of them out there that they do not need any preserving.

Senator JONES of Washington. No. Protection preserves through opagating. They have to be propagated. They have to be cared in order to insure the supply. Of course, you might think that they propagated amply themselves, if they let others come in from outside, it would make our own supply last; but we find that our and similar aquatic products must be cared for and propagated order to keep up the supply. If people who are likely to go into it industry are prevented by foreign competition from doing so it an injurious effect upon the industry. People go into it, of urse, for money. They do not go into it for philanthropic purses. So, if competition from the outside is so strong that they not make any money, they stop propagating and the domestic oply goes down. That is the way of other things. That is our eat reason for a protective tariff.

I would like to have these letters go into the record.

Senator McCUMBER. They will be printed, Senator.

(The letters referred are as follows:)

SEATTLE, WASH., *August 31, 192*

Hon. WESLEY L. JONES,
Senate, Washington, D. C.

DEAR SIR: As the tariff bill passed the House it carried a 26 per cen[illegible] valorem duty on crab meat.

At the present time all canned crab meat is imported from Japan. [illegible] John N. Cobb, of the University of Washington, who is conceded authority [illegible] canning resources and methods for fishery products on the Pacific Coast, [illegible] mates that Alaska can produce 500,000 cases of canned crab meat annually [illegible] this is considerably in excess of present market requirements.

Competition of the Japanese product has so far prevented any developme[illegible] this resource, as an Alaska product must be canned with American labor [illegible] under American sanitation and plant conditions.

As in the first 10 months of 1920 the Japanese imported into this country [illegible] $2,000,000 of canned crab, you can see that the industry is worth buildin[illegible] and holding for Americans. Practically all of this money goes for [illegible] eventually, in the crab-canning industry.

We are interested in the packing of sea foods and to our knowledge there [illegible] several Washington and Oregon crab packers who are struggling to buil[illegible] the industry with the handicap of packing costs, of which labor is the prin[illegible] item.

Only the meat from the Dungeness type of crab is used while the J[illegible] use the large Spider crab for their pack, which is larger and much coarse[illegible] texture.

Without the protection of this tariff it is a hard fight. We would gr[illegible] appreciate any help you may see fit to give the Puget Sound and Alaska [illegible] packers in retaining this schedule in the completed bill. It is a good [illegible] Whether we are interested or not it is a tariff which will build up this Amer[illegible] industry.

Sincerely,

THE STUART CO. (IN[illegible]

SEATTLE, WASH., *November 5,* [illegible]

Hon. WESLEY L. JONES,
United States Senate, Washington, D. C.

MY DEAR SENATOR: You will doubtless recollect my sending you a [illegible] randum on the building up of the crab-meat industry in Alaska, Wash[illegible] and Oregon in competition with the Japanese crab-meat packers, the [illegible] of whom now control our domestic market. The tariff bill now pen[illegible] Congress imposes a duty of 26 per cent on importations, and some of [illegible] porters are now endeavoring to persuade Congress to either eliminate [illegible] proposed duty or to materially reduce it. The New York importing [illegible] Charles E. Farris Co. have issued a circular protesting against the pr[illegible] tariff, and I have taken their circular and answered it in detail, as per [illegible] randum attached hereto, and would appreciate it if you could place this [illegible] randum where it would do the most good. I have also sent a copy to [illegible] sentative Hadley and Delegate Sutherland, of Alaska.

I feel that this is a golden opportunity for establishing a very imp[illegible] industry, in Alaska particularly, and as most of the packing is done [illegible] spring and fall, it would tend to attract a more permanent population [illegible] Territory and furnish them with a greater opportunity for remunerati[illegible]

Sincerely, yours,

JOHN N. COBB, *Dir*[illegible]

Memorandum re proposed duty on imported crab meat: In a recent i[illegible] the Western Canner and Packer, published at San Francisco, Calif., I [illegible] a reprint of circular letter issued by the New York importing firm of Char[illegible] Farris Co., protesting against the proposed tariff on importations of crab [illegible] As there are a number of statements contained in the letter which mi[illegible] lead if not refuted, I have taken the liberty of answering these state[illegible] seriatim and hope you will present these to the proper committee.

1. Canned crab meat is not packed in sufficient quantities in the United tes to warrant any protective measures."

'hile canned crab meat is not at present packed in sufficient quantities to ply the domestic demand, I am positive that if the industry were protected n the overpowering Japanese competition the canneries now in existence, or jected, could easily be expanded to supply the entire demand. At present e are three canneries in operation in Alaska, while three others (one each at dova, Juneau, and Sitka) are in process of erection. In addition there are or three plants in Washington, and two in Oregon, which have canned s in recent years and would do so again were they able to get a foothold he domestic market. There are also a number of canneries in Alaska, shington, and Oregon devoted to the canning of clams and salmon which d, at but little expense, be adapted also for crab canning in addition to r other work. There are also several crab canneries on the Atlantic coast ch could participate in the work.

s to the raw supply available, would say that the Dungeness crab (*Cancer ister*) is abundant in the waters of Oregon and Washington, although ewhat depleted in the waters of California. In southeast and central kan waters, however, this crustacean is found in wonderful abundance. he present time but little use is made of them, owing to the fact that the h markets are supplied by the Washington and Oregon fishermen, the long expensive haul from Alaska to Seattle, Wash., making competition difficult the Alaska crabbers. As to canned crabs, our packers have not been able to pete with the Japanese packers, due to the low cost of packing this product apan, where labor is abundant and wages very low as compared with the h higher wages paid the far from abundant labor in this country.

Japan the spider crab is the one canned. This is somewhat different in arance from the Dungeness crab, and is especially noted for the pinkiness he claw meat, which makes it especially good for garnishing dishes, etc. same crab is also abundant in our waters, but as it is found in the open n, while our Dungeness crab is a denizen of the protected waters, such as s, straits, and sounds, where it could be easily and cheaply obtained, the ry for the former has been neglected here, although some of the new ers are equipping themselves for its capture.

have had an intimate acquaintance with the fishery resources of the Pacific ring a period of 22 years, and feel I am fully justified in stating that the t States and Alaska could together produce annually half a million cases ungeness crab meat, and possibly more, without affecting the future supply rsely, and this pack could be very materially increased if the spider crab ur waters was utilized. At present but one cannery is depending upon this les for its raw material.

n our Atlantic coast, and notably in the Chesapeake Bay section, is found blue crab (*Callinectes sapidus*). The capture of this crustacean forms one he most important fisheries of Maryland and Virginia, some 50,343,268 nds, valued at $981,807, having been marketed from these States in 1915. of these are shipped alive, boiled, or in the meat, which latter has been ved from the shell after boiling, and packed in large cans, which are not etically sealed and hence must be packed in ice and will keep for only a ed period. The first packers to succeed in packing crab meat in hermeti- sealed cans was McMenamin & Co., but, as noted elsewhere, they, too, been forced to suspend such packing, owing to foreign competition.

2. Canned crab meat has become a popular item in the diet of the American lic, and at present is within the means of the average family."

they state, canned crab meat has become a popular item in the diet of American public, and this is due in part to the publicity work of the pioneer rican packers, McMenamin & Co., of Hampton, Va., who discovered the od of hermetically canning crab meat and continued the work until, so I been informed, they were driven out of it by the Japanese competition. ral Pacific Coast packers, notably one at Blaine, Wash., were also factors he development of the demand during the early years of the present cen- , but were compelled to suspend for the same reason as the pioneers in industry.

he declared value of the canned crab-meat importations during 1920 aver- 53.44 cents per pound. In Seattle retail markets a one-half pound flat of Japanese crab meat is at present (October 31) quoted retail at 60 cents. ead of being within the reach of the average American family it is an ssively expensive article of food and belongs in the luxury class, instead

of being, as it should be, and as I hope it will be if a domestic industry can be built up, in the necessity class.

"3. To place a duty of 26 per cent on crab meat would throw it out of reach of the average family and practically kill the consumption."

The placing of a duty of 26 per cent on crab meat, as proposed in the bill, I do not believe would increase the cost of the product one cent to the American consumer; in fact, I would look for a very material reduction in the quoted price as soon as the business has been thoroughly established here. There are two reasons why I look for this, (1) because the present price on the imported crab meat is high when its cost of manufacture is considered, the fixing of a high price being possible because the foreign packers know our packers will not extensively engage in the business as long as there is doubt about our government extending protection to them in the shape of a 26 per cent tariff, and (2) the pack of American crab meat will be so large that there will naturally be a material reduction in the price, due mainly to competition.

"4. The total yearly importation of canned crab meat in the United States at present is about 50,000 cases. We believe if this duty is imposed it will reduce importations to about 5,000 cases, out of which the Government will derive by tariff only about $25,000. We are of the opinion that if a small tariff were imposed of about 5 per cent, it would not materially affect the importation and the Government would thereby derive a revenue of about $50,000, or double the amount received by the imposition of the high duty."

During the calendar year 1920 the total importations of canned crab meat amounted to 4,078,980 pounds, valued at $2,166,068. The following table shows the importations of crab meat for a term of years, the imports from Japan being kept separate from those from other countries:

Imports of crab meat, 1913–1920.

	From Japan.		From all other countries.	
	Pounds.	Value.	Pounds.	Value.
Year ending June 30:				
1913	2,810,863	$446,232	9,989	[illegible]
1914	2,728,295	445,271	25,817	[illegible]
1915	2,187,283	407,085	113,543	[illegible]
1916	2,946,124	504,415	10,552	[illegible]
1917	4,000,587	883,187	21	[illegible]
July 1–Dec. 31, 1917	1,691,143	270,826	22,600	[illegible]
Calendar year:				
1918	3,148,434	1,027,900	130	[illegible]
1919	2,683,927	1,064,936	5,9[illegible]	[illegible]
1920	4,013,530	2,141,928	65,450	[illegible]

This shows very clearly the immense preponderance of shipments from Japan, in fact, Japanese crab meat virtually monopolizes our market to the almost total exclusion of domestic canned crab meat and importations from other countries.

The only really important question here is as to whether we wish to protect our at present small industry of crab-meat canning and build it up until able to supply our domestic market and have a surplus for export, which I feel sure would not require more than a year or two under the proposed protective tariff, or to turn this business wholly over to foreigners and let them reap all the profits of it except the brokerage commissions of such firms as that of the protestants. If the former is the desire of Congress, and I feel it is, the revenue to be derived from importations can be disregarded, as many times the amount would accrue to American workers and packers in the shape of wages and profits, while many related American concerns, as noted below, would benefit through orders placed for the many articles and supplies needed to carry on the business.

"5. A high duty on canned crab meat will mean a great loss in revenue to many private enterprises and business concerns in the United States, among which may be included:

"(a) Manufacturers—Tin plate, parchment paper, box strapping, nails and ler commodities connected with the packing of canned goods.
"(b) Exporters—Distributing the above lines.
"(c) Importers—Canned crab-meat packers in the United States.
(d) Banks—Financing both the exports and imports.
(e) Jobbers—Wholesalers of groceries and kindred lines.
(f) Merchants—Retailers of groceries and kindred lines.
(g) Brokers—Buying and selling.
(h) Carriers—Rail and water."

he above is an extraordinary claim to make. As the tin plate, parchment er, box strapping, nails, and other commodities connected with the packing mported canned crab meat would be manufactured in the country of origin, ch in this case would be Japan, I can not see wherein our manufacturers ld benefit under present conditions; in fact, the only way in which they ld benefit would be through the building up of a domestic pack, when these s supplies would be furnished by our own manufacturers and thus help to ce the present large number of workers laid off in these industries owing he shortage of orders.

xporters and importers could handle the domestic pack and make as much, ot more, than they do at present in handling the imported pack.

he banks would find it much more profitable to finance the manufacturer of e goods rather than the importer, as the demand for money would be greater the resulting profit correspondingly better.

obbers, merchants, and brokers could make as much, if not more, profit ng and selling domestic crab meat as in the handling of imported goods.

ail and water carriers would profit more from handling domestic crab meat would be the case with imported crab meat, as they would not only trans- the finished product, but also the many supplies needed for carrying on an industry and packing the finished product.

". With the reduced consumption of canned crab-meat, caused by the imposi- of the high duty, the Government will lose the excess profit tax, income transportation tax or sales tax, as the case may be."

the foreign packers of crab meat pay none of these charges at present, e domestic packers would pay all of them, the establishment of a domestic ness would be quite profitable to the Government, both directly and in- tly. As to excess profit tax and income tax now paid by importers on oreign goods handled either they, or other brokers, would pay an equal nt on the sale of domestic pack, so the Government revenues would not duced.

JOHN N. COBB,
Director, College of Fisheries, University of Washington.

BUCKWHEAT, BRAN, AND SHORTS.

[Paragraphs 724 and 731.]

TEMENT OF C. M. COX, REPRESENTING ST. ALBANS GRAIN CO., ST. ALBANS, VT.

e CHAIRMAN. Please state to the committee where you reside.

. COX. I reside in Massachusetts. Melrose is my home address.

e CHAIRMAN. What is your occupation?

. COX. I am in the grain business. My principal place of ness is in Vermont.

e CHAIRMAN. Will you proceed to state to the committee the that you wish to bring before us?

nator WATSON. What articles are you referring to?

. COX. I am here with reference to paragraph 731, and also graph 724, which relates to the duty on buckwheat.

ragraph 731 has to do with by-products of wheat.

rtain items in the proposed new tariff act of 1921 are of great est to grain dealers, farmers, and poultry men of New England,

so much so that at a meeting of the grain board of the Boston Chamb[illegible] of Commerce, held on December 7, 1921, the following resoluti[illegible] were adopted [reading]:

Resolved, That the grain board of the Boston Chamber of Commerce view[illegible] alarm the proposed new tariff act of 1921, known as H. R. 7456, so far as it relat[illegible] the marked increase in the tariff rates of importation on buckwheat, bran, and [illegible] Representing as we do, the wholesale and retail grain interests of New England [illegible] take this method of informing our Senators that it is of material help to New En[illegible] to receive importations from Canada of buckwheat and bran in certain year[illegible] cially when the supply is short in our own country.

I wish to state that paragraph 724 would impose a duty [illegible] buckwheat of 30 cents per hundred pounds, whereas for the [illegible] eight years there has been no duty whatever on this article. [illegible] respectfully request that this product should come in free or that maximum duty be set, not exceeding 10 cents per 100 pounds.

Senator McCUMBER. There has been no tariff on buckwheat?

Mr. COX. There has been no tariff as far as I could find.

Senator McCUMBER. On buckwheat flour?

Mr. COX. No; on buckwheat. By the way, gentlemen, I am spe[illegible]ing wholly about coarse grain, which is used for cattle food and [illegible] food. I am not talking about anything to be used as human food.

Senator McCUMBER. Is that a fair quality?

Mr. COX. Do you know what buckwheat is?

Senator McCUMBER. I know the wild buckwheat that grow[illegible] our fields and that grows in with noxious weeds, from which we [illegible] to eliminate our grain. That is not the kind that you refer to?

Mr. COX. No, sir. It has a little black outside hull, like your [illegible] buckwheat, only much larger. It is used for human food. [illegible] flour from which we make buckwheat cakes comes out of that

Senator McCUMBER. Is the flour made from that?

Mr. COX. The same grain, but so far as our interests are conce[illegible] the people I represent, we care nothing about the human part of [illegible] product. We are interested wholly in buckwheat for feeding [illegible]

Senator WATSON. Is not the buckwheat used for feeding he[illegible] for human food?

Mr. COX. It is a higher grade that is used for human food. I [illegible] not represent any human-food concern.

Senator WATSON. There has not been a tariff on buckwheat?

Mr. COX. Not for many years.

Senator WATSON. Of any grade?

Mr. COX. On any grade. My people looked that up and told [illegible] and I have learned there has not been any tariff on buckwheat f[illegible] least eight years.

Senator WATSON. Are you speaking with reference to buck[illegible] flour grades?

Mr. COX. No; wholly about rough grain, coarse grain. Ten [illegible] per hundred pounds would be satisfactory to us.

Senator McCUMBER. Is there any particular amount of it impo[illegible]

Mr. COX. Not in one sense. It depends upon what you mean [illegible] particular amount.

Senator McCUMBER. In what amounts?

Mr. COX. No, sir. The importation of buckwheat in 192[illegible] 227,000 bushels, while the production in our own country [illegible] 13,789,000 bushels. It is a mere bagatelle, the importation, as [illegible]

ared to our production. You might say that it is a negligible uantity.

There is no item of domestic saving which comes closer to the ommon people of New England than that of keeping a small flock f hens. Their number is legion, and they are scattered through very town and many cities. Buckwheat is fed entirely in New ngland to hens, and is an important adjunct.

Paragraph 731 relates to bran and imposes a duty of 15 per ent ad valorem, which we understand it is planned shall be on a asis of United States valuation. We respectfully protest against n ad valorem basis. It involves serious question as to what price hall be considered a fair value in a country as large as ours, and where e prices in the Middle West are so much lower than in the East, wing to the high rates of freight.

Senator WATSON. You are still talking about buckwheat?

Mr. COX. No, Senator. I am talking about bran now, paragraph 31. We respectfully submit that bran and shorts be put on a pecified basis, and we also respectfully suggest a rate of 10 cents er 100 pounds as fair and reasonable.

A comparatively small amount of bran is imported from Canada hen conditions are favorable. It usually comes at periods, as at e present time, when our mills—which are running only part me—can hardly supply the demand. Bran is considered by rmers as an important feed for cattle and horses. We respectlly urge that the rate of duty be set not to exceed 10 cents per undred pounds on a specific basis.

That is the substance of the resolution of the grain board of the oston Chamber of Commerce.

Senator MCCUMBER. Where do you get your bran from; you y you desire this on account of the high freight rates from the est. How far West do you go for what you use?

Mr. COX. We use a lot from the State of North Dakota.

Senator MCCUMBER. You ship from North Dakota to New Hampire?

Mr. COX. Yes, sir.

Senator MCCUMBER. Why do you go so far as that, when there is large number of mills in Rochester and Buffalo and Minneapolis nd Duluth; why should you go clear to North Dakota?

Mr. COX. We get some from Buffalo; almost none from Rochester. f course bran and wheat products are now used in all the Middle estern States. I have reference to Senator Watson's State, where e farmers sell their whole grain and buy bran and middlings. lany farmers, particularly in Wisconsin and other Western States, re themselves very large consumers of wheat by-products, and hat is one reason why we do not get those products from all secons of the West. The demand may exceed the supply in some estern States.

Senator MCLEAN. You want 10 cents per 100 pounds?

Mr. COX. Yes, specific.

Senator MCLEAN. And that is all?

Mr. COX. And that is all.

Senator MCLEAN. How much bran is imported?

Mr. Cox. I am talking of bran and middlings together. The maxi mum amount in recent years was, in 1919, 59,000 tons, and in 19 it was 30,000 tons.

Senator McCUMBER. Is that bran exclusively, or other by-prod ucts?

Mr. Cox. All the by-products.

Senator McCUMBER. Including middlings?

Mr. Cox. All the by-products lumped together. In 1918 the were only 1,157 tons. It varies, you see, from 1,100 tons to 59,0 tons. The production in our own country of those same artic is 4,818,000 tons. So you see that the amount that I am aski would not affect the value of these products materially. It like a pinch of snuff, if that is a proper phrase to use.

Senator WATSON. How do you arrive at 10 cents a hundr pounds?

Mr. Cox. That approximates about what we were paying.

Senator WATSON. Have you gone into the production costs the United States and Canada, so as to arrive at the conclusion 10 per cent for a fairly protective rate?

Mr. Cox. No. I did not plan to make that a prohibitive rate, but what you would call a reasonable rate. It is the rate we have bee paying under the emergency tariff. Under the emergency tariff th rate is 10 per cent, foreign valuation, and the foreign valuation runnin way up into Saskatchewan, and up into the western sections Canada, is very low. The 10 per cent valuation would not be ver much different than 10 cents per hundred pounds.

Senator DILLINGHAM. What is that worth per hundred pounds?

Mr. Cox. It all depends upon where you live. If you lived ou in Dakota your valuation would have been last October about $9 o $10 a ton. If you lived in New England it would be $20 a ton; $20.5 was our selling price.

Senator WATSON. What is it in Canada?

Mr. Cox. I did not come informed on those figures. All the products are based on what the foreign market will pay.

Senator WATSON. How much of your imports of this particul product comes from Canada?

Mr. Cox. Absolutely all; none from any other market. On reason why we would like the specific rate of duty is because of th great variety in the price in our own country, as between the Wes and the East. Who is to say what the valuation is in this countr when the price is twice as much in New England as it is in Nort Dakota?

Senator WATSON. Because of freight rates?

Mr. Cox. Yes. What is a revenue officer going to use as a is basis? Is he going to take the valuation in Minnesota or in Vermont It is going to make much confusion and much litigation as betwe the importers and the Government. Besides, if you take the valu tion at the port of entry, there again you have the same troubl because the valuation in the Dakotas and in Minnesota six wee ago would have been only half the valuation in Vermont. In oth words, the people in the Dakotas and Minnesota would only hav pay half as much duty.

Senator McLEAN. Take this bran shipped, we will say, from a ieap place of production—one of the Dakotas.

Mr. Cox. Yes.

Senator McLEAN. There it would be worth to you about how uch f. o. b.?

Mr. Cox. Now it would be about $18 a ton to $19 a ton.

Senator McLEAN. And how much would it cost to get it to New igland?

Mr. Cox. About $10 a ton, roughly speaking. Another reason ıy we, who are doing a little importing of this product into New igland, wish the specific rate, is the fluctuations in the market. I ve my quotation card for October 19, showing we were selling in ston at $20.50 a ton, while our quotation card of December 12 ows we were selling at $29.50 a ton, $9 a ton more. If we should y Canadian bran in October it would not be shipped the day we lered it; it might be shipped 30 days after. It would probably e some time in transit; it might be arriving about this time, and valuation now would be $9 more than when we bought it. It a very complex situation.

Furthermore, in paragraph 731 of the proposed new tariff, bran, rts, and other wheat by-products are listed at 15 per cent ad orem, and this is the only ad valorem tariff proposed on any grain grain products not used for human food. All the others are on a cific basis. The same arguments which make for a specific duty on eat, corn, oats, rye, barley, screenings, dried beet pulp, etc., would ly to bran, shorts, and other wheat by-products. We ask that a cific rate be named on wheat by-products, and we very respectly suggest a rate of 10 cents per 100 pounds.

Owing to the very high freight rates now prevailing, the price of n in New England States during the month of October, 1921, was ıble the value of this product in North Dakota.

Senator McLEAN. Does not your price change with the seasons?

Mr. Cox. Yes.

Senator McLEAN. If you had an ad valorem duty you would have change it at least twice a year?

Mr. Cox. You would have to change it every week. Senator, I y say to you that our own house had a case with the Government olving the question of a dispute between the revenue officials and selves on certain products, perhaps a year ago. Certain interpreons were made, different from what they had been, and we won case against the Government, and we were awarded a rebate duty to the amount of about $5,600. We received bills from attorneys for $2,500, and that is what we want to avoid. We e right, and the Government sustained our contention, but the rneys got theirs, too.

The assessment of an ad valorem duty would doubtless be the se of many disputes and much litigation as between importers and Government, as I have said. If American valuation be taken at port of entry, and if bran be entered for ad valorem duty in Minota at $12 a ton, and at the same time entered in Vermont at $22, obvious that Vermonters are paying duty on the freight.

There is sent into New England from the western and central thern States (not including flour or cereals intended for human

consumption) an average of 500 carloads per day of grain and its products, so it is for the advantage of the western farmer to keep the eastern farmer in business. The principal products of the eastern farmer are fresh vegetables, fresh milk, eggs, and poultry. We can not raise beef cattle; we do not raise sheep; we can not raise an appreciable amount of the grain which we consume. We can not bring our milk or fresh eggs or vegetables from the West. We handle 40 carloads of grain and grain products a day ourselves.

Senator DILLINGHAM. You make approximately one-half of the butter in New England, and the butter producers buy every pound of grain from the West?

Senator MCCUMBER. Yes; and you ask a reasonable protection for your butter?

Mr. COX. I am not in the butter business.

Senator MCCUMBER. And upon other products. Now, should not New England accord the protection to the men who produce wheat that makes bran? In other words, you are perfectly willing to give a fair protection, as I understand it?

Mr. COX. Yes. We suggest 10 cents per hundred pounds.

Senator MCCUMBER. Does that 10 cents a hundred pounds bear a proper relation to the value of the grain of which bran is a constituent part, as the value of bran compares to the value of the grain; are you not asking for what would amount to considerably less from an ad valorem basis, in asking for one mill a pound?

Mr. COX. I can't say we are. I have not figured it out very thoughtfully and I can not give you an immediate answer. We have not tried to figure in that respect.

Senator WATSON. You are asking for a revenue tariff?

Mr. COX. For a revenue tariff based on the emergency tariff.

Senator MCCUMBER. Do you not think there should be a relation, so that bran would bear a relation to an ad valorem tariff, even though reduced to a specific rate, such as the wheat itself bears?

Mr. COX. You are putting a hard question to answer, Senator. In the first place, you are bringing in now something which relates to human food.

Senator MCCUMBER. Of course, I know wheat is manufactured into human food, but bran is not to any great extent, and what I am defending, if you may consider it as such, is that every part of that grain, whether it be middlings, or whether it be bran, shall bear a duty equivalent to the same ad valorem duty that would be on the grain itself.

Mr. COX. If you please, Senator, I do not think your position is well taken.

Senator MCCUMBER. Very well. You can explain where it is not.

Mr. COX. Bran is a product used wholly for feeding cattle and hogs, and is a low-priced product. It bears no relation in value to the inner part of the kernel of the wheat, which is used for human food.

Senator MCCUMBER. I know, but the duty would be just that much less. I am not seeking to give as high a duty on bran as on flour, a specific duty, but a duty that would compare in value so that the ad valorem equivalent would be practically the same. If bran would not be worth one-twentieth of what flour would be worth, then it should not have more than one-twentieth the duty that was

be upon the given weight of flour. Is that not a fair way to present it?

Mr. Cox. I do not know that I have sufficient understanding of that to give a proper answer.

Senator McLean. You could guess on that. Ten cents a hundred would be $33\frac{1}{3}$ ad valorem duty if the bran was worth 30 cents a hundred.

Senator McCumber. And the bran is worth considerably more than that.

Mr. Cox. The bran, Canadian value, roughly speaking, would be worth about $12 a ton. That is, taking the years by and large, and not taking the value at the moment.

Senator McCumber. That would be how much per hundred?

Mr. Cox. Sixty cents a hundred.

Senator McLean. Then you would have to have 20 per cent specific duty to get $33\frac{1}{3}$ per cent ad valorem?

Senator McCumber. And that would be about 16 per cent instead of 10 per cent?

Mr. Cox. I am asking for 10 cents a hundred pounds. What amount would it make as a specific rate?

Senator McLean. There is this factor, that the bran is itself converted into food product.

Mr. Cox. In very small quantities.

Senator McLean. You feed it to cattle and get milk and beef from the cattle?

Mr. Cox. Yes.

Senator McLean. And it is a raw material out of which foods are made, and I think you would be justified in asking for as low a tariff as possible, under the situation, because that benefits the American people. It goes into food.

Senator McCumber. But it is also our finished product. It might be your raw material, but it is our finished product.

Senator Dillingham. His point is he wants it specific.

Mr. Cox. I have here one thing more I would like to say. At a meeting of the hay dealers of the city of Boston, held on December 5, the following vote was unanimously passed [reading]:

> We note that in paragraph 778 it is proposed that the duty on hay shall be $4 per ton and $1 per ton on straw. This is exactly double the duty we have been paying. We wish to inform the Senate committee that in certain years when the crop of hay in New England and New York States happens to be light it becomes important for us to be able to secure hay from Canada, and we respectfully request that the duty on hay be continued as it has been in the past, namely, $2 per ton and 50 cents on straw.

New England is peculiarly situated, in that the price of hay and grain is higher there than in any other section of the eastern half of our country. We are at the end of the line.

Our farmers can not possibly raise all the hay which they need, and it is clearly to the economic advantage of New England that she be able to secure her supplies of all kinds of agricultural needs at as low cost as possible. The imposition of a higher duty on hay will constitute a real hardship.

Senator Watson. You are not appealing very vigorously to the fellow who represents the western farmers.

Senator McLean. If you will give us what protection we ask on milk and cream and butter, we will give you what you ask.

Mr. Cox. I would like to make an appeal on behalf of the men and women of New England, where farming started in this country, and where you can now buy farms for the cost of constructing the buildings, almost, and we do not know anything about $200 an acre. Their wildest dreams would not come up to any such figure as that. Fifty dollars an acre, $5 an acre, $10 an acre is nearer the price of our land, and there are 1,500 local grain dealers in New England and there are thousands and thousands of thrifty hard-working farmers. We have a natural disadvantage.

Senator Watson. Would not any policy of free trade with Canada now build up your farming industry in New England?

Mr. Cox. We go to Canada for a few things, and we think we are asking for a negligible amount. The buckwheat which we get comes from New York, Pennsylvania, and some from Michigan. It is so small in your affairs that it is hardly worth taking as much of your time as I have taken.

Senator McCumber. We are very much obliged to you.

MACARONI.

[Paragraph 726.]

STATEMENT OF B. R. JACOBS, REPRESENTING THE NATIONAL MACARONI MANUFACTURERS' ASSOCIATION.

Senator McCumber. Please state your full name and residence.

Mr. Jacobs. Benjamin R. Jacobs. I reside here in Washington. I represent the National Macaroni Manufacturers' Association, the Alimentary Paste Manufacturers' Association, the Philadelphia Macaroni Manufacturers' Association, the New England Macaroni Club, and the Connecticut Macaroni Club. These five organizations represent about 75 per cent of the production of macaroni in this country.

Senator McCumber. I do not just understand what you mean by "macaroni club."

Mr. Jacobs. They are local organizations that have drawn individuals interested in that particular locality. Just as we have flour clubs in Minneapolis and in Kansas City, so we have macaroni clubs in Connecticut representing the macaroni manufacturers of Hartford and other cities around there, and we have the New England Macaroni Club, with headquarters in Boston, representing the State of Massachusetts.

Senator McCumber. It is a club whose constituent members are manufacturers of macaroni?

Mr. Jacobs. Yes, sir.

Senator Watson. It is not necessary to eat the macaroni, is it?

Mr. Jacobs. No, sir; it is not necessary to eat it. They just make it.

The domestic production of macaroni in the year 1920 in this country was about 450,000,000 pounds. It was valued at about $45,000,000.

The investment of the macaroni manufacturers in this country is sixteen and one-quarter millions of dollars, and the number of wage earners employed is approximately 12,000. The amount of macaroni imported into this country in 1914, which was practically the last

ear it was imported, was 126,000,000 pounds, and in that same year 00,000,000 pounds were produced in the United States.

Senator McCUMBER. How much is imported?

Mr. JACOBS. One hundred and twenty-six million pounds, so that ıe increase to 450,000,000 pounds, the amount produced in 1920, ıs merely been absorbed by reason of the inability of Italy to export ıacaroni into this country.

Senator WATSON. What is the amount imported this year up to ıis time?

Mr. JACOBS. The amount is practically negligible. It was about a illion pounds.

Senator McCUMBER. Why is that?

Mr. JACOBS. That is because Italy is practically the only country om which we receive macaroni.

Senator WATSON. Have we, in the meantime, made more our- lves?

Mr. JACOBS. Yes; we have practically taken care of that inability Italy to export. Ninety-five per cent of the macaroni imported mes from Italy. Italy, until last December, had an embargo on l wheat products. This has been lifted, and Italy is now offering in the New York market cheaper than we can manufacture it er here.

Senator SIMMONS. We are now producing more than we produced d imported together in any year before the war?

Mr. JACOBS. Yes; because Italy has not been exporting to this untry.

Senator SIMMONS. We are producing all that we need, are we not?

Mr. JACOBS. Exactly. We are producing all the macaroni we ed, but the minute Italy gets on its feet again she will begin to port macaroni into this country just as she did before the war.

Senator SIMMONS. Notwithstanding that we have all we want?

Mr. JACOBS. Yes; because she can make it cheaper than we can. ıly is now offering macaroni to the manufacturers in this country. ıave a quotation from Naples for first-grade macaroni made from per cent semolina. The quotation is 5.1 cent per pound f. o. b. ples, with a rate of exchange of 4.20, which was the rate on vember 14.

Senator WATSON. What would that be laid down in New York?

Mr. JACOBS. Duty free in New York about one-half a cent above ıt. The freight and insurance would be about half a cent a pound.

Senator WATSON. What is it made of?

Mr. JACOBS. It is made from durum wheat semolina. Durum eat is raised mostly in North Dakota, Montana, and Utah.

Senator WATSON. Do they raise that particular kind of wheat in ly?

Mr. JACOBS. No, sir; they raise some in southern Italy. They se a great deal of it in Algeria.

Senator WATSON. They take the North Dakota wheat clear across Italy to manufacture macaroni, and ship it back to this country?

Mr. JACOBS. Yes; and they can do it cheaper than we can make it e.

Senator WATSON. What is the difference between macaroni, ghetti, and vermicelli?

Mr. JACOBS. They are made out of the same raw materials, the only difference being in the shape.

Senator WATSON. It is the same material, is it?

Mr. JACOBS. Yes, but made up in different shapes. It is all made out of durum wheat.

Senator MCCUMBER. It used to be called macaroni wheat, was it not?

Mr. JACOBS. Yes.

The United States Tariff Commission made a survey of macaroni wheat in 1920. They found in the eastern territory, where the imported macaroni competes with the domestic, that the cost of conversion was 3.98 cents per pound. The cost of the material entering into this macaroni was 6.47 cents per pound. That information can be found on page 20 of the survey.

Senator MCCUMBER. 6.47 cents per pound?

Mr. JACOBS. $6.47 per hundredweight.

Senator MCCUMBER. Is that correct?

Mr. JACOBS. Yes; the semolina was costing them about $13 a barrel.

Senator MCCUMBER. I wish you would repeat your statement. Your first statement was based on 100 pounds at 3 cents for cost of conversion.

Mr. JACOBS. The cost of conversion is 3.98 cents per pound. That is the cost of making it.

Senator WATSON. Can you give us the exact difference between the cost of production at home and abroad?

Mr. JACOBS. Yes.

Senator WATSON. Do you make this yourself?

Mr. JACOBS. I represent the manufacturers. I am a chemist, and I know about their method of manufacturing—the process and the material which they use. It costs in Italy 1.65 cents per pound to produce it, while it costs us 3.98 cents per pound to produce it.

Senator WATSON. How is that?

Mr. JACOBS. I say it costs in Italy 1.65 cents per pound to produce it; it costs here 3.98 cents per pound to produce it, a difference of 2.33 cents per pound.

Senator WATSON. You are speaking now of macaroni?

Mr. JACOBS. Yes.

Senator WATSON. Is there the same difference in the cost of vermicelli?

Mr. JACOBS. They are practically alike.

Senator WATSON. And noodles?

Mr. JACOBS. Noodles are a different product. They contain eggs.

Senator WATSON. That is the first time I have ever heard of shipping noodles all around the world.

Mr. JACOBS. There is a difference there of 2.33 cents per pound.

Mr. Scaramelli, who was here this morning representing the Italian Chamber of Commerce, was before the Ways and Means Committee of the House.

Senator MCCUMBER. When were these figures compiled which show the cost of production in Italy to be 1.65 cents per pound?

Mr. JACOBS. They were taken from this pamphlet gotten out recently for the benefit of the Ways and Means Committee. The

ere taken on the basis of the wages that were paid there to laborers other industries; for instance, the bakers.

Senator McCUMBER. What do they have to pay for the wheat?

Mr. JACOBS. That is what I want to know. How can they quote cents a pound for macaroni f. o. b. Naples when we can not quote for 5 cents on American wheat.

Senator McCUMBER. They have to have American wheat?

Mr. JACOBS. Yes.

Senator McCUMBER. They have to grind it?

Mr. JACOBS. Yes; they do.

Senator McCUMBER. Macaroni wheat is cheap now. It has been ove a dollar a bushel. It takes about 4.5 bushels to make a barrel flour.

Mr. JACOBS. Yes.

Senator McCUMBER. Then, there is the cost of grinding and the st of making it over into their pastry. I do not see how it is ssible.

Mr. JACOBS. Well, that is the quotation.

Senator McCUMBER. I do not see how it is possible to quote 1.65 nts per pound.

Mr. JACOBS. That is only the cost of conversion. That does not clude the cost of materials.

Senator McCUMBER. That is what I was asking for.

Mr. JACOBS. No. The cost of conversion—that is to say, the conrting of semolina into macaroni—is 1.65 cents. They pay almost much for semolina as we do, except that they do it on a cooperave plan.

I want to read a few lines. This appears on page 13 of the survey:

In most cases the Italian manufacturer for export is also a miller, which permits m to operate on a smaller margin of profit. The Italian miller conducts two operans, milling wheat in the preparation of semolina and its by-products and making mentary pastes. Moreover, he is also located at the seaboard, such as Naples and noa. The raw material (wheat) is imported to and the finished product (macaroni) exported from the same plant, thus greatly promoting economy in operation.

Senator WATSON. Can't you do that in the United States?

Mr. JACOBS. No, sir. The macaroni people and millers are enrely different concerns here. It would not pay one macaroni manucturer to start a mill when he does not know anything about the illing process.

Aside from raw materials the most important cost items are labor and drying. In e drying operation the Italian operator, especially in the southern part, where more an 60 per cent of the exports originate, has favorable conditions in out-of-doors tural drying. Then, again, the Italian industry is organized to buy and sell llectively.

This is what our commerce reports have to say about it:

Trust methods, in so far as they control trade by avoiding unprofitable competition, not seem to meet with disfavor in Italy as regards milling business. Public sentient seems to sanction such restraint of trade as will produce an adequate profit to a anufacturer even of foodstuffs. Likewise, the purchase of supplies is controlled. heat imported, varying from 30,000,000 to 50,000,000 bushels annually, is largely pplied by one house, which more than any other one concern may be said to control e exports of wheat from Russia, with a similar dominating influence in Argentina. illers do not have to pay for wheat on arrival or in advance, but are given what time d credit they require by the house supplying the imports. Competition in the urchase of imported wheat does not exist. It is profitably regulated.

That is the reason they can quote 6 cents per pound f. o. b. Naples when it is made from American wheat, and we can not begin to do it for that price.

Senator WATSON. What is the difference in the labor cost itself?

Mr. JACOBS. It costs the Italian 1.65 cents per pound to make macaroni. That is the actual cost of conversion into macaroni.

Senator WATSON. Can you tell us how the average wages paid in the Italian factories compare with those paid in the United States?

Mr. JACOBS. Yes. The average wage paid in Italy for the pressman, who is the man in the macaroni factory who gets the highest wages, is from 18 to 20 lira. In this country, in 1920, the average wage was from $6 to $7 per day.

Senator WATSON. How much are 18 and 20 lira?

Mr. JACOBS. At 4 cents, about 80 cents. We are paying $6 and $7 per day while they are paying 70 or 80 cents per day.

Another thing: We are asking for 3.5 cents on macaroni per pound and we are asking for 4 cents per pound on noodles.

Senator SIMMONS. What did you say you pay for labor?

Mr. JACOBS. $6 and $7 per day.

Senator SIMMONS. That must be skilled labor, is it not?

Mr. JACOBS. Yes; it is skilled labor. They run machinery.

Senator SIMMONS. Is it skilled labor that they use over there?

Mr. JACOBS. Yes; they run the presses that we do.

Senator SIMMONS. Where did you get the figures showing the labor costs here and the cost of labor in the production of macaroni in Italy?

Mr. JACOBS. From Italians that have come over here and from this book on wages gotten up for the Ways and Means Committee. It has reference to bakers. That is practically the same kind of labor, you see. The baker and the macaroni manufacturer are practically the same. They get practically the same wages. There was no statement in that bulletin regarding the wage paid the macaroni manufacturer, but that is verified by the actual price that they are quoting on that product.

Senator SIMMONS. I noticed the cost of macaroni—the Italian cost I suppose it is—has been constantly increasing for quite a number of years. I mean the value has been increasing. The value per unit has increased to 12.6 cents.

Mr. JACOBS. Yes.

Senator SIMMONS. It was only 4 cents in 1910.

Mr. JACOBS. Yes.

Senator SIMMONS. It remained at that rate until 1915, when it went up to 7 cents. Since then it has gone up to 12 cents.

Mr. JACOBS. Yes.

Senator SIMMONS. We do sell macaroni in this country.

Mr. JACOBS. Yes.

Senator SIMMONS. At what price?

Mr. JACOBS. At about 8 cents. Of course, it has come down considerably.

Senator SIMMONS. If you take the statistics of 1921, they show that there was imported into this country during the 10 months 1,146,895 pounds.

Mr. JACOBS. Yes.

Senator SIMMONS. And that was valued at $129,336. That was)out 9.4 cents per pound. That was the warehouse price in this ›untry.

Mr. JACOBS. That is the value placed by the Italian importer and ıat is the value in Italy.

Senator SIMMONS. That is what it was invoiced for here.

Mr. JACOBS. Yes, Senator; but that is the value——

Senator SIMMONS (interposing). That is more than you say you ıarge for it.

Mr. JACOBS. But we are selling our macaroni for about 8 cents in ılk.

Senator SIMMONS. The macaroni that came in here in 1920 that ›u are complaining was made at so much less cost is introduced ıre at a higher price than you sell this for.

Mr. JACOBS. Yes.

Senator SIMMONS. Well, don't you see any significance in that?

Mr. JACOBS. They get 3 cents a pound more in New York than we) for the same kind of product. It costs them less to make it.

Senator SIMMONS. Why? Why does it sell at that price?

Mr. JACOBS. Simply because it is an imported article.

Senator MCCUMBER. Not because it is better, but simply because is made in Italy?

Mr. JACOBS. It is not better, but they do get a better price.

Senator MCCUMBER. Because they think it is better?

Mr. JACOBS. Yes, because they think it is better, just the same as ith this tomato sauce.

According to Mr. Scaramelli's statement before the Ways and eans Committee——

Senator SIMMONS (interposing). If the Italian macaroni sells for cent a pound more in this country than you charge for it, how are ›u hurt by the fact that it is made for less in Italy than here?

Mr. JACOBS. He can sell it for less.

Senator SIMMONS. If he does not sell for less than you, how are ›u hurt if he is able to make it for less than you?

Mr. JACOBS. The Italian manufacturer does not get the difference; ıe importer gets the difference.

Senator SIMMONS. I understand that the invoice price at which ıe goods come in here is the price at which the foreign producer ılls in his market.

Mr. JACOBS. Yes.

Senator SIMMONS. I do not see that the importer has anything to) with that price. He may charge a commission, but he does not ĸ the price.

Mr. JACOBS. The price it is selling for is 6 cents a pound in Italy.

Senator SIMMONS. Do you mean to say that the 9-cent Italian ıacaroni, no better than yours, can drive out of the market the merican macaroni?

Mr. JACOBS. It can when it costs 9 cents.

Senator SIMMONS. When it is sent to this country and the pur- ıaser in this country is required to pay 9 cents, do you think, if it not better than yours, that you are in danger of having your ıdustry destroyed when you can sell it for 8 cents?

Mr. JACOBS. Yes. He can charge 8 cents and run us out of business.

Senator SIMMONS. It does not look as if he is running you ou now, because since the close of the war we have been producin about 450,000,000 pounds.

Mr. JACOBS. Yes.

Senator SIMMONS. There came in during 1917 only 3,500,000 pounds.

Mr. JACOBS. Yes.

Senator SIMMONS. In 1918 there were only 661,000 pounds; in 1919, only 603,000 pounds; in 1920, only 827,000 pounds. Tha does not seem to me to indicate that he is running you out of busines because you are selling in this country 450,000,000 pounds.

Mr. JACOBS. But you must remember, Senator Simmons, that ther is only one country in Europe that exports it to the United State and that country is Italy. Until last September there was an em bargo on wheat products, and that is the reason Italy has not ex ported macaroni into this country.

Senator MCLEAN. Doesn't Italy practically control the market?

Mr. JACOBS. Yes; and they are going to do it again.

Senator SIMMONS. There was no embargo this year.

Mr. JACOBS. The embargo was taken off in September.

Senator SIMMONS. Yes.

Mr. JACOBS. But they have not had a chance to get readjusted.

Senator WATSON. Do the Italians eat more of this macaroni tha anybody else?

Mr. JACOBS. Yes, sir.

Senator WATSON. Do they want it from Italy?

Mr. JACOBS. Yes; they prefer it. They use the American macaro only when they can not get the Italian macaroni.

The survey says that the preference of the Italian population f Italian-made macaroni is quite firmly established. The Americ product is used by them as a substitute. Therefore a duty on the im ported product will likely have but little effect upon the amount im ported.

That is not a statement that I make, but a statement that your ow tariff commission has made.

As I said before, the Italians get 3 cents a pound more for the sa grade of macaroni in New York City than we do. That added to t 2.33 cents per pound, which represents the difference in the cost production, gives them a total advantage of 5.33 cents a pound. W are asking for 3.5 cents in order to overcome some of the advanta that they have.

Senator SIMMONS. I understood you to say that the fact that th sell their product at a higher price than you sell your product f does not interfere with you.

Mr. JACOBS. I say it does not make any difference within 2 or cents. They will sell it in preference to ours.

Senator SIMMONS. How are you to be helped?

Mr. JACOBS. The Government will get the profit. The Governme will get some of it at least.

Senator SIMMONS. Oh, you are interested in the Government?

Mr. JACOBS. Yes; somewhat.

Senator SIMMONS. I thought you were speaking for your own iterests.

Mr. JACOBS. We will get part of it.

Senator McLEAN. During the time there was substantially an embargo you had an opportunity to introduce your goods?

Mr. JACOBS. Yes; we have introduced our goods.

Senator McLEAN. Are you holding that trade that you got?

Mr. JACOBS. We do not know. There was very little imported. Ve have not exported. We can not go into South America and ompete with the Italians.

Senator McLEAN. Since the Italian quotations have been coming ito this country are they taking your market away from you ?

Mr. JACOBS. Yes; they are so far as they come in. There has ly a small amount come in, but so far as it has come in, they are iking it away.

Senator McLEAN. Notwithstanding the several years in which our product has been used—and it has been used because they could ot get any other—you fear that immediately when their product omes in they will cease to buy your products?

Mr. JACOBS. Yes.

Senator McLEAN. Have you any data to demonstrate that?

Mr. JACOBS. No; because it has not taken place yet.

Senator McLEAN. You claim that your article is as good, do you ot?

Mr. JACOBS. It is as good.

Senator McLEAN. And you can sell it for 2 or 3 cents a pound heaper?

Mr. JACOBS. No; we can not. They ask 2 or 3 cents a pound ore.

Senator McLEAN. Well, you can sell it cheaper, and it is just as ood, and you have a market to-day. Is that correct?

Mr. JACOBS. On a purely competitive basis we could not sell it cheaply as they can.

Senator McLEAN. You anticipate that when they import freely ey are going to capture your market?

Mr. JACOBS. Yes; they are going to do it. There is no doubt out it at all.

Senator SIMMONS. But as yet you have no data to give to the mmittee?

Mr. JACOBS. No; because the embargo has been off only two or ree months. They have had no chance to do it.

Senator McCUMBER. Is there anything further?

Mr. JACOBS. No; I think not.

BRIEF OF B. R. JACOBS, REPRESENTING MACARONI MANUFACTURERS' ASSOCIATIONS.

There are approximately 550 known macaroni factories and innumerable small es whose capacity is unknown. These represent between twelve and fifteen ousand wage earners. There is an estimated investment of sixteen and a quarter llion dollars in the macaroni industry. The domestic production for 1920 was proximately 450,000,000 pounds, valued at $45,000,000. Since 1914 the production s increased 50 per cent.

In 1914 there were approximately 126,000,000 pounds of macaroni imported into s country. This is the maximum importation of any one year. In 1878 the amount ported was 2,000,000 pounds. From these figures it can readily be seen that the

importation has increased very rapidly. From 90 to 95 per cent of the total macaroni imported comes from Italy.

"The very large increase in our manufacture of macaroni during the past two decades has been largely due to the successful culture of durum, a hard spring wheat in the Northwest prairie region. It was introduced from Russia, its largest producer and is also grown in the Mediterranean regions, principally in southern Italy, France and Algeria.

"Because of its drought and rust resistance characteristics durum wheat outyields in parts of the Dakotas, Montana, and Minnesota the leading varieties of common spring wheat by at least 2 bushels per acre. Its production has rapidly increased from 60,000 bushels in 1901 to about 50,000,000 bushels in 1918. Early production increased so rapidly that the development of a milling market did not keep pace as mills were not equipped for grinding it profitably. At first, therefore, the price was always below that of common wheat. Since 1912, however, the average price for equal grades of durum and northern has been nearly the same. In more recent years, because of the increased demand for American durum, the best grades of durum wheat have occasionally been at a small premium.

"Durum wheat contains a larger percentage of nitrogen, or crude protein than any other class of American wheat. This is one reason why durum wheat is so desirable for the manufacture of alimentary pastes. To produce the best quality of macaroni it is essential to have a semolina, or meal, produced from a hard glutinous wheat.

"Although a large part of the durum wheat is exported, the domestic macaroni industry has been instrumental in stabilizing its price. This has had a very pronounced effect upon agriculture in certain sections of the dry Northwest. In most recent years approximately 3,000,000 acres have been devoted to durum wheat. Part of this area represents new land which can not produce other grains and the balance has replaced other spring wheats which do not yield so well as durum."

In Italy the importer of wheat, the miller of semolina, the manufacturer of macaroni, and the exporter of macaroni are all one and the same individual, and to keep these four industries going permits him to operate on a smaller margin of profit. The Tariff Commission says:

"Moreover, he is also located at the seaboard, such as Naples and Genoa. The raw material, wheat, is imported to and the finished product, macaroni, is exported from the same plant, thus greatly promoting economy of operation. Aside from the raw materials the most important cost items are labor and drying. In the drying operation the Italian operator, especially in the southern part, where more than 60 per cent of the exports originate, has favorable conditions in out-of-doors natural drying. Then, again, the Italian industry is organized to buy and sell collectively.

"The Italian import duty on wheat is 0.66 of 1 cent per pound. If the product is used in manufacturing macaroni according to Government standards, this duty is refunded. In addition, the miller secures the by-products from manufacturing semolina duty free. Thus the macaroni manufacturer is encouraged to use foreign wheat for export.[3]

"Trust methods, in so far as they control trade by avoiding unprofitable competition, do not seem to meet with disfavor in Italy as regards milling business. Public sentiment seems to sanction such restraint of trade as will produce an adequate profit to a manufacturer, even of foodstuffs. Likewise the purchase of supplies is controlled. Wheat imported, varying from 30,000,000 to 50,000,000 bushels annually, is largely supplied by one house, which more than any other one concern may be said to control the exports of wheat from Russia, with a similar dominating influence in Argentina. Millers do not have to pay for wheat on arrival or in advance, but are given what time and credit they require by the house supplying the imports. Competition in the purchase of imported wheat does not exist. It is profitably regulated."[4]

On the other hand, it must be remembered that every pound of flour that is converted into macaroni by an American manufacturer must bring a profit to an American miller, as the mill and macaroni industries are entirely divorced in this country.

Ninety-five per cent of the imported macaroni enters either New York, Boston, or Philadelphia and is consumed east of Pittsburgh and Buffalo. Sixty per cent of the manufacturers and 75 per cent of domestic production is also in this territory. Therefore, it would seem reasonable to compare the cost of Italian macaroni with the cost of domestic macaroni with which it competes. The Tariff Commission Survey shows that in the East the cost of conversion is $3.98, divided as follows: $1.2[illegible]

---

[1] U. S. Tariff Commission Information Survey, G-3, 1921, p. 9.
[2] Ibid., p. 13.
[3] U. S. Tariff Commission Information Survey, 1921, G-3, p. 13.

[5] U. S. Tariff Commission Information Survey, G-3, 1921, p. 20, table 4a.

r cent, for labor; $1.07, or 27 per cent, for sundries; and $1.65, or 41 per cent, for erhead.

On the basis of average prewar value [6] of imported macaroni the conversion cost is proximately $1.50 per 100 pounds, while on the basis of the relative wages the st of conversion is about $1.65 per 100 pounds. In Italy the pressmen earn from to 22 lira per day, which on the present basis of exchange is less than $1, while in the ited States the same workmen earn from $30 to $36 per week. This is at least six nes as much as the same workmen receive in Italy. Since 1914 the cost has increased nsiderably in terms of lire but has increased but slightly in terms of American money.

Mr. Scaramelli, representing the Italian Chamber of Commerce, in his brief before e Committee on Ways and Means (Tariff Information, 1921, pt. 3, p. 1711) made e following statement: "Due to the stimulus of necessity the American manu- turers vastly improved the quality of their product. Excellent macaroni is made this country to-day, and while the imported macaroni would still enjoy a preference th many, there is really no great difference in their comparative intrinsic quality." also states that the imported macaroni of the same quality as the domestic sold for cents per box of 22 pounds above the price of the domestic.

"In New York the price of imported Italian macaroni generally ranges from 1 to 3 nts higher than that of domestic macaroni. In line with this fact, the point should stressed that the Italian product apparently has no difficulty in finding an American rket at a higher figure than the domestic product." [7]

Tabulating the above figures we have the following difference in cost of manufacture d price differential of imported and domestic macaroni:

nversion cost of domestic macaroni in the East, 100 pounds	$3.98
nversion cost of imported macaroni, 100 pounds	1.65
Difference	2.33
ice differential in favor of imported product	3.00
Total advantage of imported product	5.33

This is the great advantage in favor of Italian macaroni. The label sells the product. e Italian consumer prefers an Italian-made product, even of inferior quality to the mestic.

"The preference of the Italian population for Italian-made macaroni is quite firmly ablished. The American product is used by them as a substitute. Therefore, a ty on the imported product will likely have but little effect upon the amount ported." [8]

In other words, the Italian product, due to the foreign label, is practically and to intent and purposes a trade-mark article.

The macaroni industry may be compared to the baking industry, in that an increase duty can not be used by the domestic manufacturer to increase the price to the nsumer. The process is very simple, and especially so for the small manufacturer o sells his product before drying. A reasonable rate of duty can not, therefore, used to the detriment of the consumer. We are asking for a rate of duty of only cents per pound for macaroni and all similar preparations without eggs and 4 cents r pound for noodles and all similar preparations containing eggs.

This rate will not stop the importation of Italian macaroni, but it will yield a very terial increase in revenues to the Government. It will not increase the price of caroni to the consumer, because of the large number of small manufacturers who nt no cost, competition being very keen in this country. I wish also to empha- e the necessity for a different rate for noodles, as I note in paragraph 713 that a ty of 15 cents has been placed on desiccated eggs. We are large importers of desic- ed eggs, and the price of this product of course is largely controlled by the price the imported product. The macaroni manufacturers must pay this additional ce for the desiccated eggs which they use, and it hardly seems fair for desiccated s to enter free when introduced in alimentary pastes while the domestic manu- turer buys his product with the duty added.

We therefore respectfully recommend that paragraph 726 in H. R. 7456 be amended follows:

"Macaroni, vermicelli, and similar alimentary pastes without eggs, 3½ cents per und, and noodles and similar alimentary pastes with eggs, 4 cents per pound."

WHEAT AND WHEAT FLOUR.

[Paragraph 730.]

STATEMENT OF A. L. GOETZMANN, MINNEAPOLIS, MINN., REPRESENTING MILLERS' NATIONAL FEDERATION.

Mr. GOETZMANN. Mr. Husband's time will be divided betwe myself and Mr. L. E. Moses, of Kansas City.

My name is A. L. Goetzmann. I am president of the Millers' National Federation. Mr. Moses is president of the Kansas Flou Mills Co., of Kansas City, and likewise president of the Southwe Millers' League. I want, if you please, Mr. Chairman and gentle men, to speak to paragraph 730.

Senator LA FOLLETTE. What is your address?

Mr. GOETZMANN. Minneapolis, Minn.

Senator McLEAN. Are you speaking for Mr. Husband?

Mr. GOETZMANN. Yes, sir; and for the Millers' National Federa tion. Gentlemen, we are here to ask a compensatory duty on flou to the duty on wheat. Paragraph 730 provides 25 cents a bush for wheat and 50 cents per 100 pounds on flour. On the face of that would look, since there are 4½ bushels of wheat used to make barrel of 100 per cent flour, as if there were a discrimination again the flour of 12½ cents per barrel. As a matter of actual fact, th discrimination is approximately 51 cents per barrel. That is, und this schedule you are admitting the finished product which manufacture at 51 cents per 196 pounds less than we will have pay on wheat which we will use in manufacturing that 196 poun of flour.

It is arrived at in this way. It is somewhat technical, but I thi I can explain it very briefly. There is 72½ per cent of the total extra tion in the wheat berry producing 100 per cent flour, such as you ge tlemen will recall we ate during the war time, but which no Americ eats voluntarily. From that 72½ per cent the normal extracti that is used in a family patent flour is approximately 75 per cen.

Senator McCUMBER. Seventy-five per cent of 72½ per cent?

Mr. GOETZMANN. Seventy-five per cent of 72½ per cent. In oth words, when you figure that down it takes about 1.85 pounds of whe to make 1 pound of family patent flour. And I want to say that th is approximately the type that is imported from Canada, 75 per ce or even higher extraction, down to 50 sometimes. The result is th it takes approximately 6 bushels 2 and a fraction pounds of whea make 1 barrel of family patent flour, and the cost of the wheat is cents per bushel, or rather the cost of the duty is 25 cents per bus and on that amount—6 bushels 2 plus pounds—of wheat, it is $1. and you assess against the flour, of that amount, $1.

Senator WATSON. Is that the kind of flour you make?

Mr. GOETZMANN. That is the kind that practically everybody us in the United States. Nobody uses 100 per cent flour and nev have except for a short time during the war time.

What we would like to ask is that you place an ad valorem du of 25 per cent in the bill against protection of 25 cents per bushe wheat. That means, of course, wheat flour, semolina, crushed cracked wheat, bran, shorts, and middlings.

Senator SMOOT. Twenty-five per cent ad valorem.

Mr. GOETZMANN. Twenty-five per cent ad valorem, if you please.

Senator WATSON. Fifty cents per hundred pounds plus the ad lorem?

Mr. GOETZMANN. No; just the ad valorem. That does not cover question of bran, shorts, etc. When we, as manufacturers, port the wheat from which we make flour we pay for the bran, rts, and middlings on the basis of the wheat price, which amounts, h this duty of 25 cents per bushel of 60 pounds, to 0.42 cent per ınd on that feedstuff, which is $8.40 a ton; $8.40 a ton would k awfully high to a farmer, and I do not think there is any parılar necessity of it. Therefore, if we may be given the 25 per cent valorem duty on the Canadian value of bran, that would amount roximately to $2 or $2.25 per ton, and we would be satisfied and nk it would take care of itself.

et me impress upon you that we do not ask for any favors. All want on earth is to be placed on an even break with the other ow, and if the American flour miller can not work out his own ation on that basis he is willing to go down and out with his flying.

enator SMOOT. That is a 50 per cent increase over the House bill?

Ir. GOETZMANN. That would be approximately a 50 per cent rease over the House bill; yes, sir.

enator SMOOT. It is just as near as you can figure it?

Ir. GOETZMANN. Yes; as near as we can figure it. May I leave h the reporter the computation I made and ask that it be included the record? It is somewhat technical and complicated, and it ht be better if the formal statement appears in the record.

enator MCCUMBER. That may be done.

The document referred to is as follows:)

make one barrel of 100 per cent flour of 72½ per cent extraction, 4½ bushels of t (270 pounds) are required. On this, duty at 25 cents per bushel would be ½; 75 per cent separation of 72½ per cent extraction would yield 54 pounds highe patent flour, or 1 pound of flour to each 1.85 pounds of wheat. 196×1.85=362.6 ds of wheat, or 6 bushels 2.6 pounds. The duty on this wheat at 25 cents per el would be $1.51. The duty on 196 pounds of high-grade foreign patent flour cents per 100 pounds would be 98 cents, making a discrimination equivalent cents per bushel in favor of the foreign (Canadian) miller.

Ir. GOETZMANN. It should be observed that this covers only ent flour. It should be further noted that that is the only grade orted from Canada into the United States. The lower-grade r or clears are practically all exported in competition with the adian clears and therefore we can be placed on a parity in no r manner than as indicated.

enator WATSON. Do you run a mill yourself?

Ir. GOETZMANN. Yes, sir.

enator WATSON. In Minneapolis?

Ir. GOETZMANN. No, sir. My mill is in La Crosse, Wis.

enator WATSON. What proportion of the wheat you grind into r do you buy in the United States, and what proportion do you in Canada?

r. GOETZMANN. Practically all in the United States, until the year or two. During the last year or two there was much of it ight in, when there was free importation. If I may be permitted

to go a little further, I am inclined to think there will be some imported this year in spite of the duty, due to the fact of a shortage in spring wheat.

Senator Watson. Do you use spring wheat altogether?

Mr. Goetzmann. As far as we can.

Senator Watson. You use some winter wheat?

Mr. Goetzmann. Yes, sir.

Senator La Follette. How many bushels of wheat does require to make a barrel of flour?

Mr. Goetzmann. One hundred per cent flour is 4 bushels and pounds, which includes the patent flour, which we use at home, an clears, which are sold almost entirely abroad in competition wit Canadian flour. To make a barrel of family patent flour it requir 6 bushels 2 and a fraction pounds.

Senator Smoot. Six bushels and 2.02 pounds?

Mr. Goetzmann. Yes, sir.

Senator La Follette. Just follow a barrel of flour and the wh necessary to make a barrel of flour through the process. Will make a statement to the committee of the cost of the 6 bushels wheat that enters into a barrel of flour, what you get out of it anything, besides the flour, in the way of shorts and bran and th sort of thing.

Mr. Goetzmann. I will give you the exact figures. Six bush 2.6 pounds is the amount of wheat required to make a 75 per cent so-called family patent flour. In addition to that, however, we h the balance of the weight of that, made up of approximately 18 cent of what we call "first clear flour," sometimes higher than t sometimes 20 or 22, dependent on the quality of the wheat, a approximately 5 per cent of what we call "second clear flour." T covers the gross amount of flour of 72 per cent of extraction tha gotten out of the wheat. In addition to that, there is the bran middlings or shorts.

Mr. L. E. Moses. Seventy per cent of bran and 30 per cent shorts.

Mr. Goetzmann. In addition to that there is "red-dog flour." called in the Northwest. It means the bees wings and lowest qu of flour. Does that answer your question?

Senator La Follette. It does not convey much of any mean to me. I am going to formulate some questions on the subject send them to you, and would be glad if you would answer them

Mr. Goetzmann. I will be very glad to do so.

Senator Smoot. It takes 6.2 bushels of wheat to make a barr flour?

Mr. Goetzmann. A barrel of family patent flour.

Senator Smoot. In that barrel of family patent flour that it 6.2 bushels of wheat to make, how many pounds of shorts and do you get?

Mr. Goetzmann. I would hesitate to give you that. I can not right now. Will you give me the privilege of getting those figur

Senator La Follette. Certainly.

Mr. Goetzmann. Possibly Mr. Moses is more mentally alert th am with respect to those particular things, but I will be very h to furnish you that information later.

STATEMENT OF L. E. MOSES, KANSAS CITY, MO.

Mr. MOSES. I will try to clear up this subject in your mind before ding anything further to Mr. Goetzmann's statement.

The average amount of wheat, as near as we can ascertain, to make barrel of flour, from the average wheat grown in the United States, a little over 4 bushels and 30 pounds. As it gets lighter you have use a few more pounds to make 196 pounds of flour. I think the erage is about 4 bushels and 45 pounds.

Senator McCUMBER. They usually figure it at 4½, do they not?

Mr. MOSES. They use that figure, but not the soft-wheat mills. I ve ground soft winter wheat, and we never have produced a barrel flour from much less than 4 bushels and 40 pounds of the best ieat.

Senator LA FOLLETTE. Does that barrel weigh 196 pounds?

Mr. MOSES. Yes, sir.

Senator McCUMBER. How about spring wheat or hard wheat?

Mr. MOSES. You can produce a barrel from 4 bushels and 30 unds of the best wheat. When the wheat is light, and the test es down to 52, 54, and 57 pounds, we must use more wheat to oduce the flour and correspondingly produce more feed. Figuring bushels and 30 pounds as a basis, that is 270 pounds of wheat. ke from that 196 pounds of flour and you get 74 pounds of feed. iere are different qualities of feed.

Senator WATSON. Seventy-four pounds of what?

Mr. MOSES. Feed.

Senator WATSON. That is not all one kind of feed, is it?

Mr. MOSES. No, sir; that is divided into different percentages of an and shorts, but ordinarily about 50 pounds of bran and 24 unds of shorts. Out of that 196 pounds of flour a good many ople take out another 2 per cent that is sold for a feed, but at a gher price. Then they take off, as Mr. Goetzmann explained, 5 r cent low grade of second clear, and then they take anywhere m 18 per cent to as high as 30 per cent of a first clear, leaving the tent flour as consumed by the people of the United States.

Now, to follow through the necessities of all the industries having e same protection we should have the same protection for the nufacturer of flour as you give the wheat grower, not alone on our count, but if you want to protect the wheat grower you must pro- t the miller. If you don't protect the miller who mills flour, you r down your protection to the wheat grower. That is all there to it, no difference how you figure it. If we can not sell the people the United States flour for the purpose of making American bread at is ground out of American wheat, and ground by American llers, you tear down the protection on wheat.

Senator WATSON. In other words, you injure the market.

Mr. MOSES. You destroy it. You must protect the flour and the ieat. There are probably 10,000 mills in the United States. Half what we call local mills that are in restricted territory and only rket to their own people and grind their own wheat. The other lf are larger mills that go out to all the markets of the United ates and go abroad to find a market for our product. I am more niliar with the Southwest and its production of wheat and methods handling the milling business than I am with the balance of the

United States, although I am somewhat familiar with conditions throughout the country.

Senator WATSON. Where is your mill located?

Mr. MOSES. Our headquarters are in Kansas City. We have also headquarters at Wichita, Kans., and operate mills in Kansas and Oklahoma. We buy wheat from the producer, and we have 15[illegible] elevators. I am president of the Southwestern Millers' League, the membership of which takes in the States of Kansas, Nebraska, Oklahoma, Missouri, Texas, and Colorado. In that district is produced 40 or 45 per cent of the wheat raised in the United States, and we grind 33⅓ per cent of the flour if we are permitted to grind it. Last year we didn't.

Senator McCUMBER. Put in the record what you think you ought to have, assuming that it takes 4½ bushels of wheat to make a barrel of flour. At 25 cents a bushel that would be $1.12½ per barrel of flour.

Mr. MOSES. Yes, sir. Understand, however, it requires 6 bushels 2 pounds to produce a barrel of patent flour.

Senator McCUMBER. That is on the flour and also upon your middlings and upon your bran. How would you divide that so as to give the right proportion to your flour content and the proper proportion to your bran and middlings?

Mr. MOSES. It is rather difficult to divide it at all times so it will work out exactly. I don't think of any scheme other than the ad valorem which would certainly be as just as a fixed schedule on bran and feed.

Senator McCUMBER. If there is a specific duty on the wheat, why should there not be a specific duty upon the contents of that wheat when ground into flour, bran, or shorts?

Mr. MOSES. It would be all right and satisfactory to us. Figuring at 4½ bushels it would be $1.12½ for flour, or 6 bushels and 2 pounds $1.51.

Senator McCUMBER. On the whole thing?

Mr. MOSES. On the flour.

Senator McCUMBER. On the flour alone?

Mr. MOSES. On the flour.

Senator SMOOT. You mean per hundred?

Mr. MOSES. No; 4½ bushels, about $1.12½; on 6 bushels 2 pounds $1.51.

Senator McCUMBER. Would you have anything in addition on your bran and shorts?

Mr. MOSES. Yes. It works out about eight dollars and [illegible] cents a ton.

Senator McCUMBER. That would be equivalent to how much on the short contents?

Mr. MOSES. It would be the same as 4½ bushels.

Senator McCUMBER. Then you would get considerably more than the mere differential between the importing value of your wheat and the importing value of your flour?

Mr. MOSES. Yes, sir. The idea is this: In figuring the cost of a barrel of flour, if I may explain this briefly, we first multiply the number of pounds or bushels of wheat we use in making a barrel of flour. We usually use 4 bushels and 40 pounds. I use that as a figure. If you use 4 bushels and 30 pounds we take that as the basis

From that total we deduct whatever we get out of our feed, whatr we get out we deduct from that cost of the wheat. That leaves cost of a barrel of flour. We never expect to make any money on d. There is not a miller in the United States that figures any fit on feed. We deduct from our cost of wheat the entire amount get out of our feed. The competition is so keen that we must do with the number of mills that are in the United States.

That results in the cost of 100 per cent flour, 196 pounds to the rel. To that cost we add our manufacturing and the cost of ng business. The large per cent of the offgrade flours, first clears, ond clears, and low clears, is shipped abroad. We export that. people in Europe do not eat as good flour as we do. The British s will take some of our 100 per cent flour, but the Scandinavian ntries take that second clear, first clear. All rye-eating countries to have it to mix with their rye bread. They don't care for or.

Ve get all we can for that flour abroad to meet the competition of ign mills. That is where we must sell it. Our people in the ited States will not eat it, and we can not grind it if we can not e an export market. We have commenced to build up our exts of this offgrade flour, so that the market is practically relieved hat. We usually figure if we can get what we term cost out of it are satisfied. It keeps us running. We give credit to the patent r cost that we sell in the United States all we get out of the exted flour. When we get through we divide that by the percent- of the patent flour, 75 or 65 or 70, some go as high as 80, but I nk the average is 75.

Therefore, to the people of the United States our cost, based on actual cost of doing business, on the actual cost of wheat, means we get out of brans and shorts, all we get from exporting flour and offgrades, is credited against the cost of patent flour, and figuring t cost of patent flour delivered to New York or any other destiion you include also the cost of the sacks. I guess that is about Insurance is a small item.

enator LA FOLLETTE. What do you get for a barrel of flour now?

Ir. MOSES. It depends on the delivery.

enator LA FOLLETTE. What is it in Minneapolis? What is it in nsas City?

Ir. MOSES. Kansas City patent flour is worth about $7 a barrel the sack.

enator LA FOLLETTE. By the sack?

Ir. MOSES. Yes, sir.

enator McCUMBER. What is the next highest grade worth?

Ir. MOSES. That is the highest.

enator LA FOLLETTE. $7 for 196 pounds?

Ir. MOSES. Yes. Of course, you have to add freight and all that t of thing to it.

enator SMOOT. What does the wheat cost you?

Ir. MOSES. Our wheat is worth to-day in Kansas City, the milling s are about $1.20 a bushel.

enator SMOOT. That is what I thought. It takes 4½ bushels to ke a barrel of flour?

Ir. MOSES. Yes, sir.

Senator SMOOT. That is $5.40?
Mr. MOSES. Yes, sir.
Senator SMOOT. Your bran and shorts, 74 pounds, are worth 7[illegible] cents?
Mr. MOSES. No, sir.
Senator SMOOT. What is it worth?
Mr. MOSES. Bran is $10 a ton.
Senator SMOOT. That is a half a cent. What are shorts?
Mr. MOSES. Selling about 14, average about 12.
Senator SMOOT. 25 cents, and 24 pounds of shorts. What is [illegible] price?
Mr. MOSES. That would be 70 cents. Take off 6 cents for sack[illegible] It figures about half a cent.
Senator SMOOT. 36 cents?
Mr. MOSES. A barrel?
Senator SMOOT. Yes.
Mr. MOSES. All right.
Senator SMOOT. $5.40 and 36 cents, $5.76?
Mr. MOSES. To that must be added the cost of doing busin[illegible] We are figuring it as $1 a barrel now.
Senator WATSON. The cost of doing business at $1 a barrel?
Mr. MOSES. Yes, sir. Last year at this time it was running $[illegible] and $1.50.
Senator SMOOT. That would be 24 cents you would make [illegible] barrel?
Mr. MOSES. On how much?
Senator SMOOT. $5.76.
Mr. MOSES. That is 100 per cent flour.
Senator SMOOT. Yes.
Mr. MOSES. We sell that to-day at $6, maybe less. That is [illegible] the patent flour, such as you use.
Senator SMOOT. That is not the patent flour?
Mr. MOSES. No; that is the 100 per cent flour. Now, from [illegible] price we deduct the percentage of the three different grades that [illegible] export, and the amount we get fluctuates considerably. Say we [illegible] making a 70 per cent patent, and we sell the 30 per cent of clear [illegible] abroad. And that we send abroad, the different grades and p[illegible] centages, is deducted from the $5.76, and afterwards the result [illegible] divided by 70 per cent, to give you the cost of the patent flour.
Senator WATSON. What are you selling patent flour for to-day?
Mr. MOSES. About $7 in Kansas City.
Senator WATSON. About $7 in Kansas City?
Mr. MOSES. Yes, sir.
Senator MCCUMBER. And that takes 6 bushels of wheat?
Mr. MOSES. No; 4½. We use 6 bushels of wheat, and you [illegible] figure in off grades of flour.
I think, gentlemen, that the ad valorem duty is the proper du[illegible] flour and feed. If you give us $8 a ton on feed, which it figure[illegible] here, and bran is worth $10 a ton, that would not be sensible t[illegible] a duty of $8 on $10 bran. The consumer of feed is going to buy [illegible] as low as he can.
Senator MCCUMBER. If we give you a duty upon a barrel of [illegible] flour equivalent to the increased duty upon the wheat that go[illegible]

at barrel of flour, why would you need any protection upon the an and shorts to get the proper differential?

Mr. MOSES. I will tell you the reason why. We don't need it, far as that is concerned, but Canada has a large milling capacity. eir population is very much less than ours, and they have great ficulty in disposing of their feed. We are in direct competition Canada in the foreign market with our flour, and here you can pose of your feed, and the cheaper you can sell your flour the aper Canadian mills can make a barrel of flour, and the cheaper y can undermine our markets in Europe. If we open the bars Canadian mills to bring their feed in here, we are building up their ling industry, grinding Canadian wheat, which they will ship oss the ocean, and we can not compete with them. It is hard ugh right now.

dislike to take up so much time, but last year at this time our t of producing a barrel of flour, owing to the light run of about per cent of our milling capacity, largely due to Canadian flour ing into our market, averaged in the United States about $1.50 arrel. We have to figure that or we will lose our mills. To-day mills of the United States, owing to the domestic market being s instead of Canada's, are running practically 100 per cent of our y capacity, and grinding a barrel of flour for a dollar. The sumers of the United States are saving that 50 cents. We are making it. Don't get that in your heads, with the competition 10,000 mills. We can't get together. We might, if we could. more you can foster the milling industry and give us that home ket, the less the cost of flour to the people of the United States pared with the cost of wheat.

enator CURTIS. What effect will the permission to mills of this ntry along the border to import Canadian wheat and reexport ave upon you?

r. MOSES. We have no objection to that, if section 316 really ns as I read it, as it is written here. We don't object to any mill he United States buying Canadian wheat and grinding it and exing it, provided that identical wheat products are exported.

enator McCUMBER. Including the bran and shorts?

r. MOSES. Including the bran and shorts.

enator McCUMBER. You are in Kansas City?

r. MOSES. Yes, sir.

enator McCUMBER. There is a market that is not so greatly afd as the northern market. The hard variety of spring wheat, rule, is not raised in any greater quantity than supplies the ng demand in that country. There is very little of our hard g wheat exported at all, only the very poor grades. It is all by the mills in the United States. Now, if they can get it right the line, what effect would that have upon the American mills?

r. MOSES. As far as that is concerned, I don't wish to get into sectional controversy, but we raise a hard winter wheat that we r into competition with hard spring wheat, and we assure you just as good flour.

enator McCUMBER. Minneapolis will not come down to Kansas and buy wheat.

r. MOSES. They are getting it right now, carload after carload g to Minneapolis.

Senator McCumber. Because they can get it from Canada without paying 25 per cent duty.

Mr. Moses. Yes; that is, using American wheat. The farmers in our section are getting the benefit of that.

Senator McCumber. I admit that; but what I am contending is that they are not injured if you can supply the milling demand at any time by reaching right over across the line and keeping your mills running with Canadian wheat.

Mr. Moses. If you are thinking a great deal more of their using Canadian wheat rather than American wheat; I am thinking about using American wheat for American consumption.

Senator McCumber. If the wheat is free, of course they will use Canadian wheat.

Senator Curtis. I do not think you understand Senator McCumber's question. He wants to protect American wheat, and is trying to find out the effect.

Mr. Moses. The effect would be, if they could reach over the line and bring this wheat in, they would not buy our wheat, and our Kansas and Oklahoma and Nebraska farmers that raise hard winter wheat would be compelled to come in actual competition with Canadian wheat growers.

Senator McCumber. By the mere grinding alone?

Mr. Moses. Yes, sir.

Senator McCumber. Because they are not going down to your country to get your hard wheat?

Mr. Moses. No, sir.

Senator McCumber. They would go into Canada, which would be nearer, if it was free, and it would naturally drive our wheat down.

Mr. Moses. It would. Of course, all former tariff laws in the United States always protected wheat to the extent of 25 cents a bushel and $1.25 on flour. There is a very short clause on the grinding of wheat in bond, or any other raw material, and the identity of the product must be maintained.

Senator McCumber. Which is not followed out in fact.

Mr. Moses. Not always; but they police it pretty well.

Senator Watson. Under the system of American valuation, you could get out the American value of that product?

Mr. Moses. Yes. It appears to me that the ad valorem duty would protect our wheat, with the fluctuations up and down in the wheat market, better than the specific duty, if the feed is protected by specific duty. Take this as it is written now, at practically a dollar a barrel, and it is sufficient to protect us, if the feed is high enough to keep out the Canadian wheat, with the exception that we would be subjected to occasional raids of Canadian flour coming over, particularly in New York and New England.

It might be interesting to you to know that we have figured from our different capacity mills that to shut down a mill one day on account of lack of orders, and we did it several days last year, cost us for a 500-barrel mill $385, and we discharged every man we could get rid of except the force of skilled labor that we must maintain. That runs on up in a 2,000-barrel mill. I think a 2,000-barrel mill costs $1,200 a day to shut down. We have to keep our salesmen on the road to sell more flour. We have to keep our millers and engineers and all our help that we can not replace by going to

dinary labor market, and to avoid shutdown for a day the mills all ht. A miller will sacrifice his goods rather than do it. If Canada ts a shortage of orders and they can ship over into this country, ey may pay you a dollar a barrel rather than shut down. They uld not make any money, but they would supply that much of r market with Canadian flour ground out of Canadian wheat, and lon't want to see it. We can raise enough wheat in this country more than supply our people. Our milling facilities are superior those of any nation in the world. I think our operators are as nomical as any, and by statistics furnished by the Federal Trade mmission it is the fourth and fifth largest industry operated with ess per cent profit, preceding the war, than any industry. It is ighly competitive industry. There is never such a thing as a price eement made that I know of. I have lots of personal friends in milling business, but when we get in competition with a brand of ir flour it is all forgotten. We have less excess milling production, pared with the requirements of the consumer of flour on the nestic market. We should export 30 per cent of our run.

'hey are rapidly getting hold of a foreign market again, and I eve we can in that way not only increase the average price to farmer, because it is better for the farmer to have a buying rer of seven or eight thousand mills rather than a few exporters, you will give employment to American labor in grinding the at and supply the dairy interests with a large volume of mill feed lower price, and that should make milk and butter cheaper.

'e believe this is an essential industry, a semipublic utility, and you should consider not only our needs as millers, but the effect it upon not only the producer, but the consumer, to keep us running. ou keep us running we will furnish the people of the United States the cheapest flour of any people on the globe. If we are shut n half the time and you let foreign flour be dumped in here, the umer must pay the price and we will go broke. We are trying to go broke. It is pretty hard work to figure it out. Last the backbone of the United States market was broken by Cana- wheat and flour. In one day it went off 25 cents a bushel on unt of flour going to New York City and the New England es.

TEMENT OF A. P. HUSBAND, REPRESENTING THE MILLERS' NATIONAL FEDERATION, CHICAGO, ILL.

r. HUSBAND. Mr. Chairman and gentlemen, we submit for your ideration the following resolution, adopted by a committee he Millers' National Federation, appointed to represent the rs of the United States in tariff matters [reading]:

> lved, That we favor a specific duty on both wheat and flour, and that the specific on a barrel of 196 pounds of flour shall be four and one-half times the specific on 1 bushel of 60 pounds of wheat plus 50 cents.

e CHAIRMAN. For whom do you speak?

. HUSBAND. For the Millers' National Federation. There are nt to-day Mr. L. E. Moses, president of the Southwestern rs' League, Kansas City, Mo.; Mr. W. V. Hamilton, president of New York State Millers' Association, Caledonia, N. Y.; Mr. ge P. Urban, of Buffalo, N. Y.; and Mr. C. M. Cochran, who are

members of the New York State Millers' Association, all being members of the Millers' National Federation.

Mr. Chairman, I have prepared a short brief which, with your permission, I will present.

Senator SIMMONS. Can not the witness state to us what he wishes to present?

Mr. HUSBAND. I can do that; yes, sir.

The CHAIRMAN. You can file a brief and state in a few minutes the points you wish to bring out. That will make a better impression.

Mr. HUSBAND. All right. Some representatives of the millers appeared before your committee in August and at that time made a statement that an ad valorem duty on wheat flour would be satisfactory. At that time they were dealing with a theory; to-day we are dealing with conditions. The importations of Canadian flour into the United States for December, 1920, reached the point of 226,7.. barrels of wheat flour. That went down to 118,000 in April, 1921, when consideration was being given to the emergency tariff bill and went down to 6,000 barrels in June when the emergency law was in effect. Within a few months the Canadian millers discovered that it was possible——

Senator SIMMONS. You are comparing the month of June in each of these cases or comparing some other months with the month of June?

Mr. HUSBAND. No, sir. I was going to state to the committee the figures given by the Bureau of Foreign and Domestic Commerce of the United States Department of Commerce, covering the crop year 1920.

The Canadian millers apparently discovered that under the ad valorem system of assessing the tariff they could base the tariff on flour at the principal markets in the country in which it was produced, which in the case of Alberta was very much lower than the duty that we would have to pay upon the amount of wheat necessary to make a barrel of flour. The lowest possible amount that is possible to use for the production of a barrel of 196 pounds of flour would be 4½ bushels. We were down to that during the war; that is the minimum; to import that much wheat——

Senator LA FOLLETTE. What is the average?

Mr. HUSBAND. The average would be nearly 5. Taking the small mills throughout the country, I think it would be quite 5, if not over, because their machinery is not as efficient as in the commercial mills. That meant the miller importing that much wheat would have to pay $1.57½.

We took a transaction in Canadian flour in Boston in the latter part of November of a sale at $7.50 Boston, duty paid. That was Canadian flour, and that was as near as we could average it up from 80 cents to $1 below what United States flour was being offered for in Boston at that time.

Senator WALSH. Including freight from the West?

Mr. HUSBAND. Yes, sir.

Senator WALSH. How much was that freight?

Mr. HUSBAND. The freight item from the West, from Minneapolis to Boston, say, was about $1 a barrel.

Senator WALSH. What was the freight from Canada?

Mr. HUSBAND. More than a dollar.

Senator WALSH. It was more than a dollar?

Mr. HUSBAND. Yes, sir; considerably more than a dollar. We ured as near as we could that that milling company paid 90 cents barrel tariff duty upon that flour. It is seen that when they dis- vered that fact the importations of Canadian flour to the United ates rose from 3,500 in September of this year to 45,738 in tober. I tried to get the figures from the department for Novem- , from the Bureau of Foreign and Domestic Commerce, but could t do so.

Senator MCCUMBER. What was the number imported the previous tober?

Mr. HUSBAND. The previous October, when we had free trade, it s 163,312, but it had gone down in July in the meantime to 2,270 rels under the application of the emergency tariff. It is currently orted by men in the business that there was made a sale last day in New York City of 100,000 barrels in one lot of Canadian ur. If the tariff on that is paid at the source of production it l probably work out not much better to the advantage of our es, of our import duties, or to the American miller, than vious sales in the form of flour, and if it works out on the same is it would come in on the basis of from 18 cents to 19 cents a hel on the wheat involved, instead of the 35 cents that it should e paid.

Senator SIMMONS. What is it you want?

Mr. HUSBAND. We want a specific duty on both wheat and flour, that the specific duty on a barrel of 196 pounds of flour shall our and one-half times the specific duty on 1 bushel of 60 pounds wheat, plus 50 cents.

Senator SMOOT. Plus 50 cents a bushel?

Mr. HUSBAND. No; 50 cents a barrel.

Senator SIMMONS. What will that amount to?

Mr. HUSBAND. That will amount to $1.62.

Senator WALSH. How much is that over the present emergency ff rate?

Mr. HUSBAND. The emergency tariff act provides for a specific y of 35 cents a bushel on wheat imported into the United States an ad valorem duty of 20 per cent on wheat products. That is protecting us sufficiently, and that is the cause of our distress.

Senator WALSH. How does this work out?

Mr. HUSBAND. It would work out that, even with the difference change, we would be amply protected under our proposed change.

Senator WALSH. How much more will the Government collect per el for duty over and above what it collects now, if your recom- dations are adopted?

Mr. HUSBAND. You will understand that flour is made all over ada. It is not confined particularly, but naturally the western adian flour mills who are selling flour in the United States will the flour from a point farthest west so that it will pay the st tariff, which on the present basis would be about 90 cents.

Senator WALSH. You figure that the Canadian millers without any f can undersell you a dollar now?

Mr. HUSBAND. Yes.

Senator WALSH. Why is not a dollar enough tariff? You know I am from Boston.

Mr. HUSBAND. Yes, sir; and Boston has been the sore spot that it has been the dumping place, if you will pardon the use that word; they are dumping flour in there at low prices which can not meet. The facts of the matter are that our industry is in good shape. I am sorry to say that there have been sever rather serious failures within the last few weeks, and the Canadi miller very much dislikes to give up the United States market wh he enjoyed under free trade.

Senator SIMMONS. Would you not very much dislike to give the foreign markets you enjoy?

Mr. HUSBAND. I certainly would, Senator, and I expect our Gov ernment to help us keep those foreign markets.

Senator SIMMONS. How are you going to keep them if you not let the foreigner sell in this country?

Mr. HUSBAND. Well, you gentlemen appreciate, of course, every time you hit us you are hitting the farmer through us.

Senator SIMMONS. Is not that true of you, if we hit the farmer

Mr. HUSBAND. That is only exceptional.

Senator SIMMONS. If the farmer comes here and demands a p hibitive duty upon everything he produces, do you not expect everybody will follow suit and demand a prohibitive duty u everything he produces, and then we will have a wall against influx of foreign goods of any kind; and do you not think that w have a very disastrous effect upon your keeping those mar outside, which you say you so much want?

Mr. HUSBAND. Senator, that is purely a question for the ec mists, I think.

Senator SIMMONS. It is a very serious question for this commi I want to ask you this question. I do not know whether I understood you, but, as I understood, you wanted a specific dut flour which would amount to $1.62 a barrel?

Mr. HUSBAND. At the present basis of wheat that is what it w amount to.

Senator SIMMONS. And then you want in addition to that 50 ad valorem?

Mr. HUSBAND. No. We are through with ad valorem; we d want to consider that now; $1.62 is the full duty asked.

Senator SIMMONS. Then 50 cents a barrel. What is that 50 a barrel reduced to ad valorem?

Mr. HUSBAND. I could not tell you that.

Senator SIMMONS. What is the ad valorem specific?

Mr. HUSBAND. On a barrel of flour?

Senator SIMMONS. Yes.

Mr. HUSBAND. As near as we can get at it, the Canadian ma turer of flour in Calgary to-day pays 90 cents a barrel duty.

Senator SIMMONS. You add 50 cents to that and you have $ Do you think that would keep out all Canadian flour?

Mr. HUSBAND. Three months ago we felt it would; now we do

Senator SIMMONS. What I am getting at is that you want t all Canadian flour out?

Mr. HUSBAND. Personally I should like to keep it out.

Senator SIMMONS. You think that will keep it out?

Mr. HUSBAND. We think, after due consideration, that the tariff ked for here would certainly keep much of it out.

Senator SIMMONS. All of it?

Mr. HUSBAND. It might.

Senator SIMMONS. Then, what you are asking is not a duty; what u want is an embargo?

Mr. HUSBAND. What we are asking for is a protective duty.

Senator SIMMONS. What you said would make it amount to an ibargo. Does protection in your mind mean an embargo; is that ur definition of protection?

Mr. HUSBAND. I consider, sir——

Senator SIMMONS. I want to know whether you want a protective ty, or whether you want an embargo; whether you want a duty high that the Canadian can not get over the wall?

Mr. HUSBAND. So far as wheat flour is concerned, we feel that the er capacity in the milling business in the United States is so great at we are entitled to furnish to the people of the United States ery barrel of flour they need.

Senator SIMMONS. Are you any more entitled to that than the pro- cer of any other article that has any competition?

Senator WALSH. Is not what you are asking for an embargo?

Senator SIMMONS. If you are entitled to that, every other man who inufactures any product in this country which comes in competition th a foreign product sold in this country would be entitled to the me thing.

Mr. HUSBAND. Senator Simmons, answering your question, I was rn and raised in Pennsylvania.

The CHAIRMAN. I never knew any Pennsylvanians who asked for at kind of protection. [Laughter.]

Mr. HUSBAND. Gentlemen, we come to you frankly asking you for iat we consider is a protective tariff for our industry against our nadian competitors.

The CHAIRMAN. A protective tariff is usually considered to be one ualizing conditions; but you are asking for a prohibitive tariff, an tirely different proposition.

Mr. HUSBAND. The equalizing condition should take into consider- on the difference in the value of the American and the Canadian llar, among other things.

The CHAIRMAN. That is a matter we hope to get adjusted.

Mr. HUSBAND. That is a factor that we are meeting to-day.

Senator LA FOLLETTE. What is flour selling for per barrel in this intry now?

Mr. HUSBAND. I will have to ask some of the millers. I do not ow. I will ask Mr. Moses to tell you that.

Mr. L. E. MOSES. The ordinary grade of straight American flour it is being offered in the New York market, which is the largest irket, to-day is about $6.25 sacked.

Senator LA FOLLETTE. A barrel?

Mr. MOSES. Per barrel, sacked and delivered to New York.

Senator McCUMBER. That is a competitor with spring wheat?

Mr. MOSES. That is a competitor with spring-wheat flour manu- tured in North Dakota.

Senator McCUMBER. What is the price of spring-wheat flour?

Mr. MOSES. About $1 over that; $7.25.

Mr. HUSBAND. Mr. Moses has just reminded me of one thing ... make clear to you, as to approaching the matter of equalizing th... duty on the basis of 4½ bushels. That does make a bushel of flo... such as we used during the war, but the character of flour the Cana... dians are shipping in here represents the patent-flour content of abo... 6 bushels. That is a little technical and had better be handled b... some of the practical millers, rather than by myself.

Senator MCCUMBER. Do you export flour?

Mr. HUSBAND. Yes, sir; we have been fortunate in exporting fl... owing to the active cooperation of the United States Shipping Boa... in that they have given us a rate on the finished product as again... wheat that has permitted us to resume rather largely the exportat... of flour.

Senator SIMMONS. Where do you send it?

Mr. HUSBAND. Pretty well all over the world.

Senator MCCUMBER. Do you export spring-wheat flour?

Mr. HUSBAND. Yes; all characters of flour.

Senator MCCUMBER. What proportion of the exports of spri... wheat flour is made from Canadian wheat that is manufactured ... bond?

Mr. HUSBAND. I could not tell you that offhand.

Senator MCCUMBER. That, of course, pays no tariff.

Mr. HUSBAND. That does not pay any tax under present conditi...

Senator MCCUMBER. Except 1 per cent?

Mr. HUSBAND. Yes.

Senator MCCUMBER. There is considerable of that done, is th... not?

Mr. HUSBAND. I do not know that it is a very important fact... I know of only one mill of any size that is at present grinding in bo... that is the Washburn-Crosby Co. I do not know whether they h... more than one of their plants in bond.

Senator MCCUMBER So that they can under the present law, un... the provision as to grinding in bond, practically supply all the ex... flour from Canadian grain?

Mr. HUSBAND. Well, no. You will understand that a great de... our export business comes from the great Southwest.

Senator MCCUMBER. But I am speaking now of the spring-wh... product; the spring wheat itself, as I understand it, is not expo... to any great extent. A very small percentage is exported in ... form of wheat as macaroni and some of the lower grades, but ... good spring wheat raised in the United States is mostly made i... flour in the United States, and the spring-wheat flour that is exp... is mostly made from Canadian wheat ground in bond.

Mr. HUSBAND. I do not believe that is correct.

Senator MCCUMBER. Why should it not be correct if you can p... chase in the United States that product at a price less than ... American product? If they are both on the same basis, of c... there can be no object in doing that, but if the American w... should rise a little above the Canadian price so it would be profit... to import and grind in bond, then, of course, all ground in bond w... was exported would be Canadian grain, because it would be profit... to do that.

Mr. HUSBAND. All the grinding in bond? You are incorr... stating that practically all the spring wheat went to be ground. Th...

e millions of bushels of it brought through Duluth and other ports at go out as wheat.

Senator McCUMBER. Yes; but that is not what we call the cleared riety; that is macaroni and some other lower varieties; but the od milling wheat that makes the higher grade flour is practically ground and used for home consumption, is it not?

Mr. HUSBAND. Millers have to pay a premium for that, because ey have to bid against the exporter for it.

Senator SIMMONS. What did I understand you to say were the portations of flour last year?

Mr. HUSBAND. I did not total it. We figured the importations of ur from Canada for the crop year. That would be from Septem- r to the end of August, and I think it figured something like 00,000 barrels, or something like that. The statement was made at it represented 7 per cent of the flour production of Canada that s exported into the United States for the crop year beginning Sep- nber, 1920, and ending August, 1921, and in three months of that ne it was down very low.

Senator SIMMONS. During the 10 months of 1921 the imports are ven as follows: Free, 767,805 barrels; dutiable, 57,705 barrels. That uld make a little over 800,000 barrels that were imported during e first 10 months of 1921. Now, the exports of flour for the first months of 1921 are given at 14,540,000.

Mr. HUSBAND. Yes, sir; we have been 40 years developing that rket abroad.

Senator SIMMONS. Now, I see that of these exports 66,000 barrels re sent to Canada.

Mr. HUSBAND. That is a situation arising from the fact——

Senator SIMMONS. It is very peculiar.

Mr. HUSBAND. Not at all, Senator; you can make certain crackers biscuit only from our soft wheat flour.

Senator SIMMONS. The countries to which these 14,540,000 barrels flour were exported during the first 10 months of this year are ctically all the countries of the world, as you said a little while o. Now, when you export your wheat to all these countries— stria, Belgium, Denmark, Norway, the Netherlands, the United ngdom, Canada, and Europe, and so on—you have to sell that in mpetition with Canadian flour and with flour produced at almost y other place in the world, do you not?

Mr. HUSBAND. Yes, sir.

Senator SIMMONS. Are you able to send it out and distribute it all er the world and compete with all these flours produced in all ese places, and are you able to make any profit on that?

Mr. HUSBAND. The average miller does not figure on making any ofit on the export business. The average miller figures that by ans of his export business he gets a larger percentage of run for s plant, reducing the overhead not only on his export business t on his domestic business.

Senator SIMMONS. If the exportation of this 14,000,000 barrels is stopped, would it hurt you at all?

Mr. HUSBAND. You will understand that the American people mand and do get the highest character of flour that we can make r them, and in making that high-grade flour we make what is lled clears, lower grades of flour, such as Europe is hungry for

to-day, and our export business is made up largely of flour of that character.

The CHAIRMAN. How does that differ from the superior article furnished to the American consumer?

Mr. HUSBAND. If the war flour, such as we had, would stand as a type, that is what we use largely to export, and we extract the better particles of the wheat and manufacture the patent flour for domestic trade.

Senator SMOOT. You get more pounds of flour out of a bushel of wheat that way than if you ran it straight through?

Mr. HUSBAND. I do not quite catch your meaning, Senator.

Senator SMOOT. With a lower grade of flour you can make more pounds of flour out of a bushel of wheat?

Mr. HUSBAND. Yes, we ran that very closely during the war.

Senator WALSH. The flour you export is more bran and shorts?

Mr. HUSBAND. No; the bran and shorts are taken out, but they are inferior flours from the American standpoint. They are dark in the first place.

Senator LA FOLLETTE. Has it more gluten in it?

Mr. HUSBAND. My friend Mr. Moses can relieve me on the technical part.

Senator WALSH. Do you export any flour that is sold in the American market?

Mr. HUSBAND. Oh, yes.

Senator WALSH. Do you export that same flour at a lower price than it is sold for in the American market?

Mr. HUSBAND. I have done so in my experience as an exporter, for the reason that it costs so little to sell it. I have sold as high as 20,000 barrels and it cost me only 72 cents to sell it by cable, when it would have cost $2,000 in this country for brokerage.

Senator SIMMONS. I notice you exported during the first 10 months of this year to the United Kingdom 3,767,244 barrels and to Europe 1,450,348 barrels. You do not mean to tell the committee that the United Kingdom uses a very inferior kind of flour, do you?

Mr. HUSBAND. The United Kingdom imports considerable quantities of clear, Senator, very large quantities of clear.

Senator SIMMONS. Do not they buy in that country proportionately as good a grade of flour as our own folks do?

Mr. HUSBAND. No, sir; none of those countries do.

Senator SIMMONS. There are a great many folks over there that want a good grade of flour and would be willing to pay for it?

Mr. HUSBAND. I think so, and unfortunately for us the British miller is grinding it for them out of our American wheat taken over at lower freight rates than we can get on flour.

Senator MCCUMBER. How is it that the Canadians can import their flour for a less price than you are able to manufacture it; does he pay less for his grain?

Mr. HUSBAND. Well, sir, I saw a statement some time ago that during November mills in the western part of Canada were paying cents for No. 1 northern to the farmer. You are from a wheat country, Senator?

Senator MCCUMBER. That, of course, is very much less than the American product, and less than we would like to see the American

ve to take. Also their No. 1 northern is of a little higher standard ade than the American No. 1 northern of the same wheat, because ey require a higher grade in Canada than in the United States?

Mr. HUSBAND. Yes, sir.

Senator McCUMBER. Can he manufacture any cheaper?

Mr. HUSBAND. I think he can, sir.

Senator McCUMBER. Is his labor less?

Mr. HUSBAND. It is commonly said to be somewhat less than ours.

Senator McCUMBER. He has to ship it considerably farther if it is sed in Alberta or western Manitoba. What are the freight rates?

Mr. HUSBAND. He pays his freight rates in Canada to the point on border in Canadian funds, and that is somewhat to his advantage.

Senator McCUMBER. Can you say what elements make up the ount which enables the Canadian miller to sell his product in ston for $6 and how much?

Mr. HUSBAND. $6 this last sale. It has only been within two or ee weeks that this situation has been brought to our attention. have not been able to definitely determine the cause for that.

Senator McCUMBER. He pays a tariff at the present rate of how ch per barrel?

Mr. HUSBAND. Ninety cents, back in Alberta. Senator Simmons, I say to you, on the export business, that beginning with 1880 American flour-milling industry has exported flour every year, and only 9 years of those 41 has that export fallen below 10,000,000 rrels.

Senator SIMMONS. But we allowed some imports during those ars.

Mr. HUSBAND. I think the imports during those years were very all.

Senator SIMMONS. They are very small now.

Mr. HUSBAND. But they are getting larger.

Senator SIMMONS. You said a while ago you wanted to give me ne additional information. What did you say you were selling ur flour for?

Mr. HUSBAND. Mr. Moses will answer that.

IEF OF A. P. HUSBAND, REPRESENTING THE MILLERS' NATIONAL FEDERATION, CHICAGO, ILL.

We submit for your consideration the following resolution, adopted to-day by a mittee of the Millers' National Federation, appointed to represent the millers of United States in tariff matters:

"*Resolved*, That we favor a specific duty on both wheat and flour, and that the cific duty on a barrel of 196 pounds of flour shall be four and one-half times the cific duty on 1 bushel of 60 pounds of wheat plus 50 cents."

he duties as provided for in the "emergency" tariff act have been in operation for fficient time to determine, in a measure, their workability and adaptability to the ds of the wheat producer and wheat flour miller, as to protection intended by gress in passing that act. The administration of an act of Congress has such far-ching effect that full determination of results can only be ascertained after such act has been operative for a sufficient length of time to carry through a season or iod of commercial activity.

t is a recognized fact that the determining factor in marketing wheat is the flood ply that flows to market directly after harvest. Therefore at the time the informa- and testimony, either verbal or written, heretofore submitted by the millers of the ited States to the committees of Congress when considering a duty on wheat and eat flour, such testimony was based upon their best judgment at that time, without

advance knowledge of merchandizing and trade conditions that might arise during a subsequent marketing season or period.

The emergency tariff act provides for a specific duty of 35 cents a bushel on wheat imported into the United States and an ad valorem duty of 20 per cent on wheat products. Based upon the heretofore higher prevailing prices on wheat and wheat products, such ad valorem duty, if applied to the delivered price at port of entry, did appear to the millers of the United States as a partially commensurate tariff duty. An ad valorem duty on wheat products appeared to many millers to be the satisfactory method, based upon previous marketing and world conditions, but owing to the many factors that now exist, both commercially and financially, the millers of the United States, through the accredited Millers' National Federation, respectfully request of you to reconsider the testimony and information that has been given from time to time by various millers of the United States, wherein an ad valorem duty was advocated, and provide in the bill now under consideration by the honorable Senate Finance Committee, in lieu thereof, a specific duty that is commensurate with the duty on wheat.

To adequately protect the American wheat grower a full commensurate duty on wheat flour must be provided for in the tariff bill under consideration. Without such a fully commensurate duty on wheat flour, based upon the present actual marketing conditions the protection intended to be given the American wheat farmer becomes ineffective, because Canadian flour is being imported at a lower rate of duty than is applied to wheat.

The people of the United States demand and consume the best grade of flour that can be manufactured from wheat. To manufacture a barrel of 196 pounds of such grade of flour requires approximately 6 bushels of wheat; therefore the requested tariff duty on a barrel of wheat flour is no more than compensatory.

In the manufacture of the high-grade flour demanded by our people there is produced a lower grade, of approximately 25 per cent, which is exported to the various countries of the world that do not demand or use the high-grade flour as consumed in the United States. In exporting this lower grade of flour we are compelled to enter into price competition with the world, therefore 25 per cent of the wheat that is ground by the American mill finds its way into the export trade, and to a great extent goes to make up the total of wheat flour that is annually exported out of our surplus wheat production. The flour that is exported by the American miller finds its way into all parts of the world, and is not confined to the principal terminal wheat and milling markets, as in the case of wheat exportation. Such flour exportation brings the possibility of constant demand instead of seasonal requirements, and is an important factor in settling balances of trade with nations with whom we have commercial dealings.

The American milling industry is fourth in importance in the United States, and is not confined to any particular section of the country.

It is of supreme importance to the milling industry that our domestic demand for wheat flour be supplied by American mills that utilize American labor, American manufactured supplies and grind American grown wheat. Our industry reflects the prosperity of almost every interest in the United States. The 10,000 American mills are in competition for their wheat supplies, thus insuring a better price to the American wheat grower than could be obtained if such price should be determined only by the export wheat demand.

The supplies that the American miller will ordinarily require in machinery, etc., and the requirements of a thorough merchandising system creates an immense demand upon other American manufacturers and dealers. The skilled and semiskilled labor required by the American mills gives employment to thousands of intelligent American workers, operating under the best possible factory working conditions and environment.

The cotton grower of the South is keenly interested in the industry, as a large percentage of wheat flour is packed in cotton sacks, thus insuring a constant and dependable demand for a considerable portion of the yearly American cotton crop.

The power required for the operation of American mills insures a fuel consumption that is an important item to those engaged in such enterprise.

We feel justified in respectfully petitioning Congress to adequately protect American milled wheat flour on the same basis as American grown wheat is protected, with the full knowledge that such protection, if granted, will not only be a benefit to the American wheat grower and the American miller, but the general consuming public as well.

Wheat and wheat flour imports into the United States from Canada.

[United States Department of Commerce, Bureau of Foreign and Domestic Commerce.]

	Wheat.	Wheat flour.		Wheat.	Wheat flour.

WASHINGTON, D. C., *December 15, 1921.*

n. WILLIAM M. CALDER,
United States Senate.

)EAR SENATOR CALDER: I have been informed by some of those present when I tified before the Senate Committee on Finance to-day that I consented to a statent made by Senator Simmons that we (the millers) were asking for a prohibitive ty or a duty equal to an embargo on flour.

did not so intend, as I believe such a duty as we have asked on flour would not "prohibitive" or constitute an "embargo," but would only afford the millers of country the protection they should have.

desire that the official record of the Finance Committee of the Senate be corrected indicate that we asked only for a "protective" duty.

Very truly, yours,

A. P. HUSBAND.

)DITIONAL STATEMENT OF L. E. MOSES, PRESIDENT SOUTHWESTERN MILLERS' LEAGUE, KANSAS CITY, MO.

Mr. MOSES (answering questions for Mr. Husband). The southstern millers make their high-grade flour out of the southwest hard heat, which flour now sells for $6.25, packed and delivered in the sw York market.

Senator SIMMONS. The average export price, according to the figures read a little while ago, for 14,540,578 bushels was $104,567,661. am told that the average price received, according to these figures, r this flour that you exported was $7.30.

Mr. MOSES. I did not want to interrupt Mr. Husband's testimony, it as an exporting miller I thought I could advise you on that tter than he could.

Senator SIMMONS. That is exactly what I want, some reliable formation about that.

Mr. MOSES. We do export what we call a high-grade flour to those arkets which demand a high-grade flour compared with other marts. About 50 per cent of the flour that the United Kingdom buys om us is what they term a "patent" and what we term a "straight," e other 50 per cent is made by the American mills as an offal from e grade of flour that our American people consume. Is that clear you?

Senator SIMMONS. Yes.

Mr. MOSES. The average patent flour consumed in the United ates is about 75 per cent of the better part of the entire run of flour ade in the American mill. It is separated by machinery out of e same wheat. It does not take any shorts or bran; it is simply a

mechanical manipulation of the flour, of the entire 100 per cent production. We cut off 75 per cent, on the average, of the best grade of that flour and sell it to our American people. That is what they demand. There is very little demand for 25 per cent offal flour. That is where these spring-wheat millers export the part of the spring-wheat flour raised in your State, Senator McCumber, in this clear grade flour produced in making the high-grade flour which they sell to the American people. Without the high-grade market we can not produce the 25 per cent offal grades. If we do not produce the grade and meet the demands of the foreign trade, our exportation of flour will decrease very rapidly. Therefore, we are asking you what we need to allow us to supply the American market with American flour ground in American mills and produced from American wheat.

Senator SIMMONS. Could you tell us the average price of flour taking all grades. The average price of the exports I have given you; could you give the average price of flour here?

Mr MOSES. It would be an average, but would not be real information. The flour that is consumed in the Scandinavian countries is of still lower grade than the 25 per cent. We divide the per cent into two grades, first and second clear. Certain countries will take the second clear.

Senator SIMMONS. I am not talking about the average sold abroad, because these figures give that. I am trying to get the average price in this country.

Mr. MOSES. Our price in New York to-day would be somewhere around $6.25 for Southwest flour and $7.25 for Northwest flour of like extraction. So that is the average price. What we supply to the family trade, the better grades, would run about 75 to 80 cents increased price over the price I stated. In other words, to make the higher grade it costs about 75 to 80 cents more than to make the straight grades. That is due to the fact that we get all we can out of the export trade, where the lower grade must go, and give the benefit of that to our American consumer.

Senator SIMMONS. That is what puzzles me. According to your statements and figures as to the average price, you are getting a little more for flour that you export then you get for the flour you sell here.

Mr. MOSES. That is sometimes the case. This year our firm has succeeded in selling abroad certain sales at a little higher price than we were asking our domestic market. We do not hold up the domestic market. If I may digress a little further, the higher percentage of capacity that a mill can run the lower the cost element.

Senator SIMMONS. If you get $7.30 in the markets of the world where there is universal competition, and that is a satisfactory price to you, it does not seem to me that you would need so much protection in the home market. It surely does not seem to me that presents a situation where you have the right to come here and ask for a prohibitive rate.

Mr. MOSES. We are not asking for a prohibitive duty.

Senator SIMMONS. Mr. Husband admitted that was what he wanted.

Mr. MOSES. He is pretty well posted, but he is not a miller. My idea is this: In our price of flour 90 per cent of the cost is raw material, not taking into consideration the sack or transportation charges

herefore, the average price depends upon the price of the wheat ıat we pay to the American farmer. That is the controlling factor. heat has gone down in the last two or three months from what we st paid the farmer at the beginning of the crop. Therefore, the ices to-day would not reflect the average price we have gotten this ear. We are compelled to ask for our flour based upon the price we y the American farmer for his wheat. If wheat would go up, our ice would increase, and if wheat would go down, our price would down. Therefore, there is no such thing as an average price, ithout taking into consideration the average price of wheat. It is t like manufactures where their principal cost of manufacture is bor. Our principal cost is the raw material.

The greatest item of expense we have is the overhead; that is a ed charge that we must have to keep our organization together. we do not run we have got to keep that help, and the greater pacity we can run the cheaper we can make a barrel of flour, and e cheaper we can make a barrel of flour the cheaper we can sell to the people of the United States. Without this American arket our run is going to be reduced, and the cost of our product the people of the United States is going to be increased absolutely.

In asking this extra duty of 50 cents, I wish to say that it is protctive and not prohibitive. It is a protection against Canadian illers coming in at certain seasons and dumping their stuff on our arket regardless of cost. We do not believe it is fair that they ould be permitted to do it. The 50 cents extra, with this four and half times the duty on wheat will no more than prevent that ımping at seasonal periods. I think I am correct in stating that eir cost of doing business is less than ours, that their scale of wages less than ours. I know it is, even on the same basis, so long as ey pay their labor in Canadian currency compared with our Amerin dollar.

Senator SIMMONS. Do you export any yourself?

Mr. MOSES. Yes, sir; we are one of the heaviest exporters in the ited States.

Senator SIMMONS. Would you be seriously hurt if you lost that siness?

Mr. MOSES. Very much. The people of the United States would seriously hurt. It would increase the cost of our manufacture per cent over and above what it costs now, on account of a limited n. Our overhead will go on just the same.

Senator SMOOT. And taxes and such items as that.

Senator SIMMONS. You do not want to lose the export business?

Mr. MOSES. We certainly do not. The American industry has en built up on the export business.

Senator McCUMBER. If you did not export any of your flour there uld be so much more wheat that would be ground for flour in s country that it would depress the price of wheat?

Mr. MOSES. It would; naturally.

Senator McCUMBER. There have been times in the last 15 or 20 ars in which millers, in order to hold the European markets, have en compelled to sell at a loss?

Mr. MOSES. To keep running. That is an involved statement. would reduce our total expense per barrel. At times it is advisable us to take a large order if we can get it which might be near cost,

to reduce the entire cost of all the flour that we make, both domestic and export. We attempt to get a little profit out of the export business.

Senator McCUMBER. I was informed some years ago by the Minneapolis millers that at one particular season when the price of flour was very low in Europe they had lost about 10 cents a barrel on their entire exports for that year.

Mr. MOSES. It would be economically sound for them to do so. It would reflect to the prosperity and benefit of the general public of the United States for them to lose that. It would make their average cost 15 cents a barrel cheaper to keep that volume of business which would necessarily otherwise be taken up by the consuming American public in the price of the flour.

Senator McCUMBER. They had to consider this, that if they once lost that foreign market it would be very difficult to regain it?

Mr. MOSES. It would be. We have had very hard work this year to reestablish our brands, but I believe as a whole we have done very well. We have only felt the competition of Canadian flour in this market in the last 60 days. This reported sale of 100,000 barrels of flour means nearly 500,000 bushels of American wheat that should be consumed by the people of the United States, ground in American mills with American labor, instead of Canadian wheat ground in Canadian mills with Canadian labor. That is all there is to it, gentlemen. Which do you wish to sustain?

Senator WALSH. In other words, up to October 1 your industry considered that the rate in the emergency tariff was sufficient, as it did succeed in keeping out Canadian flour. Since October 1 there have been such shipments of Canadian flour that you are frightened and want an increased rate?.

Mr. MOSES. Based upon our past best judgment prior to the war we thought a 20 or 25 per cent ad valorem duty would protect our flour market, but owing to the exchange situation and the application of the emergency tariff by the Treasury Department in assessing that duty f. o. b. the mill instead of ports of entry, or upon Canadian valuation instead of American valuation at ports of entry, as Mr. Husband has stated, the duty paid on wheat shipped into this country in the shape of flour has only been one-half of your wheat tariff. In other words, when shipped in here, as near as we can figure, it pays a duty of about 18 cents a bushel instead of 35.

Senator WALSH. And that is due to what you think is a wrong interpretation of the Treasury officials?

Mr. MOSES. I would not wish to criticize them. They claim that is the law and they have no other recourse but to go according to the law. If that is the law they must follow it; they can not change it.

I appeared before you last August with Mr. Goetzmann, the president of the Millers' National Federation, and made a statement which I wish to withdraw, that if you could not make a specific tariff we would accept 25 per cent ad valorem as a substitute. During the past three months, under the method of valuation of the Treasury Department, 25 per cent ad valorem would not protect the American miller, compared with a tariff that you should put on wheat. We are asking 50 cents extra, over and above the usually accepted factor of $4\frac{1}{2}$ bushels to make a barrel of flour, simply as protection against

umping in seasonal periods, which has occurred in the United States ıarket.

Senator WALSH. That is what happened in the last 60 days?

Mr. MOSES. Yes, sir; and will happen every year. We want this ıarket. Until the Canadian flour came in here our mills were runıng on an average of 90 per cent capacity, which allowed us to reduce ır cost of operations, and that was reflected to the American market. o-day we have declined to about 62 per cent.

Senator WALSH. How much has this dumping reduced the price of our; what was the price on September 1, and what is it now?

Mr. MOSES. I would not say it reduces it, but it takes away our ıarket.

Senator WALSH. What was flour selling for on September 1 or —$6.25 flour?

Mr. MOSES. I could not say. It changes every day.

Senator WALSH. Do you not know what it was last September?

Mr. MOSES. I have not any idea. Flour will go up and down with ie price of wheat. It is not like any other commodity in the world. think flour in September was probably selling at 60 to 75 cents a ırrel more than now.

Senator WALSH. So it forced down the price below the cost of anufacture?

Mr. MOSES. It affected the farmer as much as us.

Senator MCLEAN. Are the millers, generally speaking, paying large vidends?

Mr. MOSES. No, sir. Prior to the war the Federal Trade Commison stated that the milling industry was run on less profit than any her industry.

The CHAIRMAN. Let me remind you that your name was not on the t to-day.

Mr. MOSES. I took Mr. Husband's place because there were some ıestions I could answer which he could not.

The CHAIRMAN. We have been very much interested in hearing you.

Senator DILLINGHAM. Relating to paragraph 731, which places an l valorem duty on bran, shorts, and other by-product feeds, it has en suggested by Mr. Cox, who appeared before the committee, that would be better to make that a specific duty.

Mr. MOSES. I agree with Mr. Cox. We do not want any ad valorem ıty. As to the amount of the tariff, I think the millers will leave at to the gentlemen of the committee, who have other industries ming here, in the way of consumers of feed, and we do not wish to ake any suggestion as to that. We are asking full protection on our ur compared with the price of wheat and our merchandising condiıns. I am sorry to have taken Mr. Husband's place, but I know he uld not answer the questions you asked, as he is not a miller.

Senator MCCUMBER. Your statement has been very enlightening.

Mr. MOSES. Thank you very much.

'ATEMENT OF W. V. HAMILTON, CALEDONIA, N. Y., PRESIDENT NEW YORK STATE MILLERS' ASSOCIATION.

The CHAIRMAN. Will you make your statement brief, because the mmittee is long past the time of adjourning.

Mr. HAMILTON. Mr. Chairman, my remarks will be extremely ief. In appearing before you it is with no design or desire or

expectation that we can enlighten your committee very much on th technical part of drawing up a tariff schedule which would app to our industry. My only thought is simply this, knowing as I do the conditions that surround the mills in the State of New York to give you some facts relating to them. We have a milling capacity in our State of about 60,000 barrels per day, and under the applica tion of the present schedule on wheat and wheat products as reflect in the emergency tariff bill, all our mills are substantially out business, with the exception of one unit, which is running on bond wheat. Mills are either running on short time, or not running a all. That is a situation, to my mind, which ought to be correct and I believe you will all agree with me that it should be correct.

The resolution which was drawn up and is presented in the br which was filed by Mr. Husband originated with the executive com mittee of the State Millers' Association of the State of New Yor and represents, in my judgment, a very clear and very con straightforward way to remedy this situation.

We oppose the ad valorem duty. If you are going to have a spe duty on wheat, the raw material, we want that duty to be reflected i specific duty of four and one-half times that, representing a duty th will prevail on a barrel of flour. Then we are on a parity in t manufactured article, corresponding exactly with the cost of raw material. There will not be any deviation from that, as w most assuredly occur if you have an ad valorem duty.

On top of that we ask for 50 cents a barrel protection, which h already been spoken of as covering the difference in cost of operat the mills in the United States and in Canada.

We believe you are here as part of this administration, because the mandate that was issued to you in our last general election t the factories and mills of the United States are entitled to so protection, and when we ask for that additional protection of 50 ce a barrel it is substantially a protective duty and we believe we entitled to it; and without such protection this great indus which we represent here will never be able to pull out of the hole th are in at the present time. We can assure you, gentlemen, that have been so near Hades that the soles of our feet are alre scorched, and unless we have relief from this most intolerable situat we can conceive of our industry being thrown on the dump he very soon.

Senator McCUMBER. To what extent are you grinding in bond New York?

Mr. HAMILTON. Only one unit, the Washburn-Crosby Co. Buffalo, is doing that.

Senator McCUMBER. Do you know to what extent they are ma ufacturing bonded wheat?

Mr. HAMILTON. I think their output is about 9,000 barrels a d

Senator McCUMBER. The entire output of the mill is how much

Mr. HAMILTON. Their capacity is, I believe, 20,000 barrels day.

Senator McCUMBER. Then they are running about two-fift bonded grain?

Mr. HAMILTON. Yes; perhaps a little more than that.

TATEMENT OF HON. EDWIN F. LADD, UNITED STATES SENATOR FROM NORTH DAKOTA.

Senator LADD. I now desire to take up for a few moments the iatter of cereals. In paragraph 730 it is provided that flour shall e subject to a tax of 50 cents to 100 pounds. I shall have to agree iere with Mr. Bell, because I heard his testimony to the effect that iat is not as high as it should be for protection.

Senator SMOOT. You want an ad valorem duty of 25 cents instead 50 cents a hundred?

Senator LADD. I had not figured on the ad valorem, but it should e raised, in my judgment, to 65 cents. The actual figures, as I calcute, would be 59.59, to say nothing about the cost of labor. I think is wiser to bring in wheat, if we are to import, rather than the our. Mr. Bell, if I remember, thought it should be not less than 75.

Senator McCUMBER. My recollection was it would be 4½ times a barrel of flour what it would be on the bushel of wheat, plus 50 nts. That would make it considerably higher than that.

Senator LADD. But it certainly ought to be higher than 50 cents, in y judgment.

Senator SMOOT. You want an ad valorem instead of a specific?

Senator LADD. I can not agree that the wheat which comes in from inada has no influence. The wheat from Canada is not in competion, as many of them claim, with the entire wheats of this country. he wheats of Canada are in competition only with the wheats of e same type that are grown in the Northwest—part of Minnesota, e two Dakotas, the northern part of South Dakota, and eastern ontana. That wheat is rich in gluten, and produces a white flour. he wheat of Kansas is very rich in gluten, but it is yellower in color the flour; and the wheat of Kansas is on the market a month or x weeks before the wheat of the Northwest and Canada comes on, id has been largely taken care of. The millers need, as was stated, l of that hard spring wheat, and when it can be brought in from inada, and especially in bond and stored in warehouses and kept to taken out when desired from time to time, it comes directly in mpetition with the hard glutinous spring wheat of the Northwest id tends to depress the price.

I have not been able to bring myself to see where it would be to the lvantage of the people in this country to permit them to add a cerin portion of American wheat and then sell the by-products in this untry without any tariff.

Senator McCUMBER. As long as we are exporting considerable the flour made of the hard spring wheat raised in the Northwest, is t the provision for grinding in bond for export trade equivalent to ving the miller the right to nullify any tariff that we may place upon e grain whenever our price is above the general level of the Canaan price?

Senator LADD. It has that effect. It makes it possible for them stop the purchase of the American product and again on the bonded oduct; and when that is done the price is depressed proportionately, id at the present rate of production, in five years more we will it be producing more wheat in this country than will be necessary r the people of this country to consume, and in 10 years at the

present rate we will be importing wheat, unless there is somethin done to encourage the wheat industry of the country.

Senator McCumber. And by encouraging the production of th so there will be less acreage of the Northwest sown to wheat, w can bring back a better equilibrium between the production an consumption?

Senator Ladd. There is no question there, because in the Nor west there will be not less than 5,000,000 acres there withdrawn wheat lands to be sown in flax, which is needed in this country, an to that extent we will reduce the amount of acreage devoted to whea

Senator Calder. Senator Ladd, have you the figures there ind cating the amount of flour imported into this country?

Senator Ladd. I tried to get that data for this year, but the figur I was able to get was 40,000,000 bushels imported from Canada but newspaper reports for the last year have stated 60,000,0 bushels; whether that be correct or not, I can not say.

Senator Calder. Of wheat?

Senator Ladd. Of wheat imported from Canada.

Senator Calder. Did any Canadian flour come in?

Senator Ladd. I do not believe I have the figures on that. The has some Canadian flour come in, but I think I have no figures.

Senator McCumber. We had a witness from northern New Yor a miller, who stated that there were great quantities now comi in from Canada.

Senator Ladd. That is what I am told. But I have not the da for it.

Senator McCumber. I do not remember how much he state

Senator Calder. What volume of flour do we export?

Senator Ladd. Beginning with July, 1920, I will read by mont the totals of all countries: July, 34,655,000 bushels calculated ba to the form of wheat; in August, 1920, 32,674,000 bushels; in Septem ber, 34,994,000 bushels; in October, 43,033,000 bushels; in Nove ber, 30,899,000 bushels; December, 30,179,000 bushels; in Janua 1921, 27,105,000; in February, 23,075,000; in March, 20,763,0 in April, 24,801,000; in May, 31,624,000; in June, 32,912,000. Th completes one full year, but it has increased very materially.

Senator Simmons. You are referring to the exports?

Senator Ladd. I am referring to the exports, calculated in the fo of wheat. The total exports for that year, from June 30, 1920 June 30, 1921, were 362,000,000 bushels, the largest export we ev had.

Senator McCumber. And, of course, we could not have that wi our crop raised in the United States without importing a great ma bushels from Canada?

Senator Ladd. There has been an exceedingly rapid increase.

Senator Simmons. I thought I understood the witness to s about 40,000,000 imported from Canada.

Senator McCumber. He said about 60,000,000.

Senator Ladd. I stated that the last official information I w able to get was nearly two months ago, 40,000,000 bushels w the newspapers have reported within the last week that there ha already been imported 60,000,000. I will not differentiate betw the official information and that which was stated in the newspap

Senator CALDER. Senator Ladd, is the duty fixed in the Fordney l as high as any other which has been levied?

Senator LADD. I think it is.

Senator CALDER. When you consider these immense importations this high duty, do you not think it is quite sufficient to protect farmer and miller?

Senator LADD. I have not asked for anything more—in the rdney bill it is 25 cents per bushel, and that is what I am asking for.

Senator CALDER. You suggested 60 cents for the flour?

Senator LADD. In order to make it compensatory with the wheat elf. As it is now you are going to induce the importation of flour, t as you did of oil, because your figures are too low on the flour compared with the wheat itself.

Senator SMOOT. Mr. Husband asks for a duty four and a half times duty on wheat or four and a half bushels to the barrel.

Senator LADD. I think that is higher than is necessary.

Senator SMOOT. The basis of that was that it takes four and a f bushels of the best wheat to make a barrel of flour.

Senator LADD. That is the usual calculation.

Senator CALDER. I ought to know, but may I ask how many unds of flour there are to a barrel?

Senator LADD. There are 196 pounds.

Senator SMOOT. But at the rate of four and a half bushels you 50 pounds of bran and 20 pounds of shorts.

Senator MCCUMBER. I can complete your testimony on the exrts of flour and wheat. That is, the first 11 months of 1921 we ported 269,497,218 bushels of wheat as wheat. Then, in addition that, we exported 15,786,443 barrels of flour, which would be uivalent to about 72,000,000 bushels of wheat, which would make entire amount of exports in the 11 months about 341,000,000. n you tell me, Senator, about what the 1921 crop of wheat in the ited States is?

Senator LADD. The report I was able to secure for 1921 was l,893,000 bushels, as compared with 833,027,000 bushels in 1920, d 968,279,000 bushels in 1919.

Senator MCCUMBER. Assuming that all of these exports of flour d wheat were from the 1920 crop, you will see that we must ve imported 50,000,000 or 60,000,000 bushels of Canadian wheat order to have been able to supply the home demand and also to port this amount of wheat in the shape of wheat and flour to rope.

Senator LADD. There is no question there.

Senator SMOOT. I do not think there is any doubt but what the st of the wheat that comes from Canada is held in bond and ported.

Senator LADD. Yes, sir.

Mr. MCCOY. These statistics of imports are here as well as those ports.

Senator SMOOT. It makes no special difference, because we know amount imported is milled in bond, and the amount of that flour es to foreign countries.

Senator MCCUMBER. I think that only that portion is mentioned which notation has to be made, and that is the proportion which milled in bond and on which there are rebates.

Mr. McCoy. That is not mentioned at all.

Senator McCumber. All along the line in the State of North Da-kota and Minnesota any farmer can bring in over the line as much wheat as he wants; there is no tariff and no report is made of it, and it is sold in American elevators and sold for American consumption and, therefore, it is impossible for the departments to know anything about what is shipped in, except that which is brought in and shipped out.

Senator Walsh. Under the emergency tariff an increased rate was made upon wheat?

Senator Ladd. Yes.

Senator Walsh. But no compensatory duty was placed upon flour?

Senator Ladd. Oh, yes; I think there was.

Senator McCumber. There was a compensatory duty, which was 20 per cent ad valorem.

Senator Walsh. It was not sufficient, was it?

Senator McCumber. It was not sufficient.

Senator Walsh. That is what I thought. Did it result in the increase in importation of flour in the last six months?

Senator Ladd. Yes; I think there is another reason for the increase in the importation of flour, and that is the difference between the monetary values of the Canadian money and our own money. When wheat was selling at $1.48, it was equivalent to 14 cents a bushel, advantage there of 14 cents on every bushel, which practically was more than one-half of the duty in that one item alone. For the coming year, 1922, there is a reduction of 500,000 acres reported in the wheat zone in the winter-wheat belts, and 100,000 acres reduction in Kansas alone; and the report from the department on December 1, according to the figures I received, show that it is 13 points below what it has been in 10 years, and considerably below the prospects of last year, indicating that the farmers have not been able to, or felt that they could not continue producing wheat at the price they were receiving for it at the present time.

I do not know that there is anything more that I care to say, unless there is some question required to be asked.

Senator McLean. Was the high peak of production reached in 1918 or 1919?

Senator Ladd. 1919.

Senator McLean. Is there a surplus now?

Senator Ladd. No—it is impossible to say. The amounts of consumption this year is estimated at considerably below what it was last year per capita, but I think there is an error in the figures, due to the fact that we did not have correct information with regard to the amount in storage and with regard to the amount in bond in this country, and the amount in storage in warehouses in this country, so that I think our figures are misleading in that respect.

Senator McCumber. Do you wish to cover other subjects?

Senator Ladd. I thought that the Committee on Agriculture or other sections would cover the other points.

Senator McCumber. I was going to say that we would be glad to hear you.

Senator Ladd. I think others can do better, unless there is some special question.

Senator McCumber. Have you considered the question of barley and rye duties?

Senator LADD. No, I have not; I have not studied barley and rye, d I think there are others on our committee that have studied ose and who can state those two subjects to better advantage. I ly studied oil, flax, wheat, and flour.

Senator McCUMBER. Mr. Bell was here the other day. You heard testimony?

Senator LADD. Yes.

Senator McCUMBER. On behalf of the millers he offered certain endments. In his testimony he stated that he thought he could nvince me and also convince yourself that it would be to the erest of the American farmer to continue the drawback and to eralize it; and I stated at the time that I should be exceedingly d to be so convinced. I have not had an opportunity to talk th him since. I was not convinced by the argument he presented re, and I would like to have your definite opinion, as I know you nt over the subject pretty thoroughly.

Senator LADD. Mr. Bell spent nearly two hours with me, but he s not able to present any data that led me to change my mind th regard to the effect it would have on the development of agri- lture in the Northwest, and that what he was asking for was not to advantage of the farmer but to the advantage of the miller. I agree with him that the compensatory duty on the flour is not at is required, but on the other features I can not agree with him, hough I would like to.

Senator SMOOT. I understood Mr. Bell to request that the bonding vilege be extended so as to allow wheat to come in from Canada d not be held in bond by itself and ground for exportation, but t the same quantity of flour be exported that would be made m a quantity of wheat imported, but not kept separate at all; that s his proposition, the liberalization that he asked.

Senator LADD. And I do not think that that is in the interest of riculturists in this country and I can not agree with him that there a demand for the additional amount of bran and of mill feed to ne in free of charge; because while it may be of some help to the tern dairymen. it is simply a direct detriment to the agriculturists the Central West, where the most of the corn and other feed ducts are grown.

Senator SMOOT. It would, if there is an overproduction at any e, but as long as there is not enough to meet the requirements I not know whether that would have any effect upon the price or t. I thought that the danger of it would be in allowing the eat to come in here and be ground in quantity rather than the ntical wheat.

Senator SIMMONS. Senator Smoot, if wheat was selling cheaper in nada than it was in the United States, would it not lead to the rchase on the part of the millers of the entire amount of wheat it they needed for the manufacture of flour that is exported?

Senator SMOOT. There would not be any American wheat, in my inion, ground for exportation.

Senator LADD. No, sir.

Senator SIMMONS. There is one other thing in my mind, and that the reason I asked Mr. Bell to explain to me why he thought there uld not be a disadvantage. The same thing occurs with relation the exportation of sugar to Cuba, and I do know if that privilege

was extended it would be very detrimental to the producers of sug in this country, and I think it would do the same thing to the produce of wheat.

Senator LADD. I think it will.

Senator SMOOT. It means that with wheat cheaper in Canada th situation will be as you contend. The Senator from North Dako has contended—I think he is wrong in some instances—that som times the differences are very small and at other times great But assuming it is cheaper in Canada than it is here, that provisi would practically take away our export trade in flour to Canada.

Senator LADD. That is what it would do.

Senator McCUMBER. Mr. Bell admitted that there was pra tically no wheat outside of durum wheat raised in the Northwest a good milling grade that was ever exported as wheat. The millin demand under ordinary conditions will cover all of the wheat th we raise of the hard spring wheat in the Northwest?

Senator LADD. Yes, sir.

Senator McCUMBER. The mills desire to keep up their exp trade. They wish to hold their old European and other custome Canada is a strong competitor in those markets. The time prote tion will do us good is when we are a little short of the amount nece sary to supply those mills; and under the provision that is asked f by Mr. Bell it would seem to me that whenever, by reason of a lit less than the American demand, the crop in the Northwest, when would get a little higher price and begin to get the whole benefit the protective tariff, that they can reach right over and tap t Canadian granary for all the grain that they need for the export tra and, of course, that would decrease the demand for the Americ wheat. That is the way it looks to me; if I am wrong, I wish som one would correct me.

Senator LADD. I think you are correct in that, and I think wh they can report 30,000,000 or 40,000,000 or 50,000,000 bushels to exported as excess quantity of wheat to be ground it has a tenden to depress the price of wheat in this country, just that factor al

Senator SIMMONS. I agree with you about that. But is not th whole protective theory based in part upon the idea that it is not apply to raw materials that are imported into this country for pu poses of manufacture and sale; does not that run all through t tariff system?

Senator LADD. I would put it this way——

Senator SIMMONS (interposing). I think you have presented a ca here where that would work a hardship upon the American far

Senator McCUMBER. That raises the question of what is r material.

Senator SIMMONS. Is not wheat the raw material of the millm

Senator McCUMBER. It is not raw material to the farmer.

Senator LADD. It is the finished product to the farmer, and if ultimate manufacturer is to have protection on his finished produc and he is entitled to that—that is all I think that is necessary give the farmer the same degree of protection as is afforded manufacturer. It may be the other man's raw material, but the farmer's finished product.

Senator SIMMONS. Of course, wheat is the product of the farm but when it is converted into flour it is the raw material of the mi man?

Senator LADD. Yes.
Senator SIMMONS. The theory that your protective tariff laws are itten upon certainly is just as I have said a little while ago, that the imported article is converted into form for the purpose of port, that the duty he has paid upon the raw material that is ported shall be remitted and rebated to him, and that is in the erest of expanding our export trade.
Senator LADD. Yes, sir.
Senator SIMMONS. Here, it seems to me, you have developed a se where there is a conflict between the interests of our export ide and the interests of our domestic trade.
Senator LADD. Yes; and I think in those cases we must consider iether the product that you are going to import duty free is one it is coming in direct competition with a like product in this intry.
Senator SMOOT. I think that the greatest danger to the farmer this country, to grant that request, would be this, that the miller ild go to work and grind American wheat here and get a big pply on hand, or he could let it run down, if he desired, and then port Canadian wheat here and get off of the American market as urchaser of wheat and run his mills upon wheat for exportation.
Senator LADD. Yes, sir.
Senator SMOOT. And bear the market price of the American mers' wheat down.
Senator LADD. There is not any question but what it has been ne for years continuously.
Senator SIMMONS. Is it not true that the sugar refinery importing r sugar from Cuba or from foreign countries and converting it o granulated sugar or refined sugar for exportation is remitted duty?
Senator SMOOT. Oh, yes; 99 per cent of it.
Senator SIMMONS. The point I am making is that if we refused to what Mr. Bell says, would you not be in conflict in this particular e with your provision?
Senator SMOOT. Absolutely; there is no doubt of it. All of the wback provisions of our law now require that the identical wheat it is placed in bond for exportation shall be made into flour, and it flour exported; and the same with Cuban sugar. The Cuban ar that comes into this country for exportation goes into bond, l it is not mixed with any other sugar that goes into local con-nption; it is refined in a bonded warehouse, shipped from a bonded rehouse to a foreign country.
Senator SIMMONS. Is Mr. Bell asking for more than that?
Senator SMOOT. Yes; Mr. Bell is asking that when that wheat comes the amount of bushels be kept track of for exportation, but that identical wheat could be ground and sold into the American rket, and at some other time they could make just the amount of ir that the importations from Canada would produce—and it may from American wheat—and exported.
Senator LADD. At any time within one year.
Senator SIMMONS. Then I think it would be a dangerous provision put in any law, but, did I understand you, Senator Ladd, as posing Mr. Bell's suggestion, if it is confined to wheat in bond ich is manufactured?

Senator LADD. If it is wheat in bond and the identical flour shipp out, I am not opposing that. But even that is used to the detrime of the American farmer.

Senator MCCUMBER. You say you are not opposing it, but as matter of fact it does work against the interests of the American farm

Senator LADD. That is just what I stated.

Senator MCCUMBER. That is so, without any possible question.

Senator LADD. There is no question there for a moment.

Senator MCCUMBER. Because it allows the miller at any t that we are a little short of wheat and our prices would be increase and the Canadian prices lower, to reach over and to get all of grain in Canada instead of making a demand here and compellin the American grain to move?

Senator LADD. That is it.

Senator SMOOT. There is one other question Mr. Bell laid gre stress upon for the committee to act upon favorably, not only assist the millers themselves but the farmer generally, and that this: He wanted what other wheat there was imported from Cana into the United States in bond for exportation, that all of the flo in the bran come in free and not be counted as wheat, but to come free as shorts and bran. I suppose you would not agree with that

Senator LADD. I would not agree with that for a moment at a

Senator SMOOT. In other words, you take 4½ bushels of wheat a whatever the duty may be upon the 4½ bushels that 4½ bus would be reduced in wheat by the amount of the pounds of br and shorts that would come from those 4½ bushels?

Senator LADD. Yes, in other words, 30 pounds out of the 100.

(Senator Ladd thereupon introduced the following statement

WHEAT CONSUMPTION IN THE UNITED STATES.

Did the use of wheat for food in the United States decrease nearly 1 bushel per during the crop year 1920–21 as compared with the average prewar consumpt That is what the statistics would lead us to believe, yet reason is against it. N nomic conditions arose during the year which could have caused such a ma reduction in the consumption from the prewar average, yet an analysis of the stat for the 1920–21 crop season makes it appear that the Nation greatly reduced its diet. But when a proposition runs contrary to reason one naturally turns to l a way out. In this case the way out seems to be the conclusion that there wer where large unaccounted-for supplies of wheat and flour at the beginning of th season, July 1, 1920.

The crop harvested in the summer of 1920 was officially estimated at 78 bushels. Wheat in farmers' hands on July 1, 1920, was officially estimated at 4 bushels, and stocks of wheat and flour in second hands—that is, wheat in and country elevators, and flour, in terms of wheat, at certain centers—wer cially estimated at 103,000,000 bushels; a total of crop and supplies on han beginning of the crop year of 938,000,000 bushels. In addition there wer of 57,000,000 bushels of wheat and flour computed as wheat from Canada dur year for domestic consumption. The total supplies were therefore 995,000,000 b

Exports during the crop year July 1, 1920, to June 30, 1921, were 36 bushels. This, deducted from the supplies, left 633,000,000 bushels for use and carryover on July 1, 1921. The quantity of wheat in farmers' hand date was officially estimated at 54,000,000 bushels, and the stocks in secon were unofficially estimated at 25,000,000, a total on hand of 79,000,000 Deducted from the net supplies of 633,000,000 bushels this left 554,000,000 quantity used for food and seed from July 1, 1920, to June 30, 1921, acc the statistics.

The foregoing is summarized in the following table:

Supplies, exports, and consumption in the 1920–21 crop year.

›p harvested in 1920	bushels..	787,000,000	
farms July 1, 1920	do....	48,000,000	
second hands	do....	103,000,000	
ported during year	do....	57,000,000	
Total supplies	do		995,000,000
ports	do....	362,000,000	
farms June 30, 1921	do....	54,000,000	
second hands	do....	25,000,000	
:ounted for	do		441,000,000
d and seed	do		554,000,000

'n a basis of the official estimate of population of 106,000,000 on January 1, 1921, per capita supplies, taking 554,000,000 bushels as the total for food and seed, e but 5.22 bushels, compared with 6.35 in the 1909–1913 prewar period. The capita supplies for food only, allowing 80,000,000 bushels for seed, were but 4.47 hels. Yet according to a statement by the Bureau of Crop Estimates of the ited States Department of Agriculture, issued during the early days of the war, normal prewar food requirements of the United States, not including seed, were bushels of wheat. That statement by the Bureau also included an estimate of l and seed requirements for 1916–17 of 615,000,000 bushels. Food requirements e put at 540,000,000 and seed at 75,000,000. On a basis of the 1916 population. was 6.14 bushels per capita.

'his compares closely with the requirements for earlier years, as shown in the owing table, which gives the average production of wheat, the exports, supplies rved for food and seed, and the per capita supplies for 20 years before the war:

5-year periods.	Average production.	Average exports.	Supplies reserved.	Per capita supplies.
-1913	690,000,000	105,000,000	585,000,000	6.35
-1908	670,000,000	115,000,000	555,000,000	6.45
-1903	680,000,000	190,000,000	490,000,000	6.30
-1898	590,000,000	170,000,000	420,000,000	6.00

mports of wheat and flour during the years included in the table were unimportant. account is taken of the carry-over of wheat from one crop year to another, for in a e of years the carry-over is equalized, or approximately so. That is, a large or a ll carry-over in any one year is lost in the average.

ll the evidence is against the correctness of the 1920–21 statistics, which show but bushels per capita used for food and seed. The estimate by the Bureau of Crop imates of 5.3 bushels for food only, as a normal requirement before the war, and bushels for food and seed in the 1916–17 crop year; an annual average of 6.35 hels used for food and seed in the 1909–1913 period, 6.45 bushels in 1904–1908, bushels in 1899–1903, and 6 bushels in 1894–1898, based upon official production export figures—all this constitutes an overwhelming mass of evidence against the)-21 statistics of supplies.

et us revise those statistics on a basis of the 1916–17 requirements of 6.14 bushels capita for food and seed. This is a fair basis and below the average of the 15 years eding the war. Taking 6.14 bushels as the per capita requirements, and 106,-000 as the population, the total requirements of the country were 650,000,000 hels. or 96,000,000 more than the 554,000,000 shown by the statistics to have been l for food and seed.

ow, how can this invisible 96,000,000 bushels of wheat be accounted for—invisible ept when a large part of it was exported and so was necessarily recorded at the board.

ecause the demand for flour was dull throughout the country during the early iths of the 1920–21 crop year, it was asserted by some members of the grain trade t consumption had decreased. The statement was made that consumption of eat for the year would show a decrease of 50,000,000 bushels.

'et a decline in the demand for flour did not necessarily indicate decreased con-ıption. It probably meant that hoarded supplies were being used. In fact, it is te certain that the decreased demand for flour was the result of that very con-

dition. During the prolonged period of high prices, up to about August 1, 19[illegible] impression was widespread that wheat would sell at very much higher prices. [illegible] result was that many housewives throughout the country had hoarded a few sa[illegible] of flour. These hoards made up an invisible supply of millions of bushels in ter[illegible] wheat, probably 40,000,000 but hardly 50,000,000; for the latter would mean [illegible] barrel of flour in each of 11,000,000 households.

If this invisible supply amounted to 40,000,000 bushels, this accounts for that [illegible] of the seeming decrease of 96,000,000 bushels in consumption during the 1920-[illegible] year. Yet this still leaves 56,000,000 bushels unaccounted for. Logically, consu[illegible] tion did not decrease that much, nor is there any reason to believe that it decrea[illegible] at all. So this unaccounted-for 56,000,000 bushels of wheat must be looked for [illegible] where, but where? Where was it when the statistics were gathered showing [illegible] amount of wheat and flour on hand on July 1, 1920? The exports included it, b[illegible] there is nothing to show from what invisible source of supply it appeared.

Exports of wheat and wheat flour from the United States, by months and countries, J[illegible] 1920, to June, 1921.

BISCUITS.

[Paragraph 734.]

BRIEF OF W. A. MELVILLE, REPRESENTING RIDGWAYS (INC.), NEW YORK CITY.

We would respectfully request your due consideration and revision of the [illegible] proposed by the House bill, which reads—

"Biscuits, wafers, cake, cakes, and similar baked articles, and puddings, all [illegible] foregoing by whatever name known, whether or not containing chocolate, nu[illegible] fruit, or confectionery, of any kind, 28 per centum ad valorem."

proposed to take the place of paragraph 194 of the present tariff bill, which reads—

"Biscuits, bread, wafers, cakes, and other baked articles, and puddings, by [illegible] ever name known, containing chocolate, nuts, fruit, or confectionery of any kin[illegible] and without regard to the component material of chief value, 25 per centum ad va[illegible]rem."

The new proposed paragraph makes all biscuits, etc., dutiable at 28 per [illegible] valorem, as against the present duty of 25 per cent ad valorem, only on those [illegible]ing chocolate, fruit, nuts, or confectionery of any kind.

We respectfully submit that the new duty of 28 per cent ad valorem on plain [illegible]cuits is:

(*a*) From a protective standpoint unnecessary, as these imported biscuits are [illegible] in price wholesale than the domestic products are retail. See Schedule A, atta[illegible] showing comparisons between imported biscuits, ex duty, and domestic [illegible] quotations.

(*b*) From a revenue standpoint very little revenue, if any, will be received, as [illegible] new proposed duty would make prices too high to permit imports to compete in [illegible] way with domestic products.

Messrs. Huntley & Palmers (Ltd.) are large buyers of American flour, bein[illegible] largest European buscuit manufacturers, the signer of this having seen in their [illegible] houses at Reading, England, in June, 1921, a floor piled high with flour from Min[illegible]apolis. We submit that any excessive rates of duty would tend to check their [illegible] of American supplies when such rates restrict their business with this country.

The following values of imports (figured at $4 to £1 sterling) show that no [illegible] necessary for protection:

1907	$156,196	1911	$1[illegible]
1908	189,948	1912	10[illegible]
1909	196,900	1913	12[illegible]
1910	134,004	1920	10[illegible]

We respectfully submit, therefore, that the plain kinds should be allowed t[illegible] free of duty as at present.

SCHEDULE A.—*Comparison between quotations of Huntley & Palmers' English bi[illegible] National Biscuit Co., and Loose-Wiles Biscuit Co.*

[Cents per pound.]

Biscuits.	Huntley & Palmers' net wholesale prices, July, 1921.[1]	Loose-Wiles Co. retail prices, June, 1921.[2]	Na[illegible]
Alphabets (H. & P. Kindergarten)	30	....	
Animals (H. & P. Zoological)	37	25	
Arrowroot	42	27	
Albert	40	32	
Butter Thin (H. & P. Butter Finger)	43	30	
Dinner	55	....	
Five O'Clock Tea (Oval Rich Tea)	42	....	
Ginger Snaps (H. & P. Ginger Nuts)	37	16	
Oatmeal (H. & P. Oaten)	43	16	
Petit Beurre	42	32	
Social Tea (H. & P. Social Thin)	35	....	
Soda crackers	30	....	
Sugar Fingers (H. & P. Sugar Wafers)	84	....	
Vanilla wafers	84	....	

[1] Laid down New York, ex duty. [2] Subject to discount of 10 and 15 per cent.

NOTE.—Huntley & Palmers' prices figured at $4 to pound sterling. Comparison covers biscu[illegible] same names put out by all three companies.

APPLES.

[Paragraph 735.]

[ST]ATEMENT OF HON. WESLEY L. JONES, UNITED STATES SENATOR FROM WASHINGTON.

Senator JONES of Washington. The House has put the tariff at 25 [ce]nts a bushel on apples, paragraph 735. As I understand it, the [ta]riff placed on apples by Canada is 30 cents a bushel. I think that [th]ere ought to be an equal tariff. If Canada is going to put 30 cents [a] bushel on apples I think we should have 30 cents a bushel also. [O]urs is the market, of course, that they are very desirous of getting [in]to. It is the big market. The apple growers in our section of the [co]untry have felt this competition very greatly.

Senator SMOOT. Where does Canada raise apples that come in com[pe]tition with yours?

Senator JONES of Washington. To the north of our State they have [a] big irrigation development, north of what is known as the Okano[ga]n Valley, and they produce a great many apples up there.

In the emergency tariff the figure was 30 cents. I suppose you will [ha]ve a general provision in the bill under which, if the tariff is raised [in] any other country and it is deemed wise to have it raised in this [co]untry it can probably be done?

Senator SMOOT. It will if I have my way about it.

Senator JONES of Washington. I hope it will be done. We had a [pr]ovision in the emergency tariff bill with reference to apples, pro[vi]ding that where the tariff on apples of any other country is raised [ab]ove 30 cents, then our tariff would be raised; in other words, so [as] to maintain an equality. That is all our people ask—an equal [ta]riff.

I do not know why the House made it 25 cents instead of 30 cents. [I] talked with Mr. Hadley, our Member on the committee, and he [di]d not remember what the reason was, if there was any special rea[so]n given. Our people want 30 cents, and that is what the Canadian [ta]riff now provides.

BLUEBERRIES.

[Paragraph 737.]

STATEMENT OF EDWIN M. FRYE, HARRINGTON, ME.

Senator HALE. Mr. Chairman, during the last few years the blue[be]rry industry has been taken up extensively in my State, and we are [try]ing to build it up. I have asked Mr. Frye, who is a blueberry can[ne]r from Washington County, Me., to come here and tell you about it. [Th]ey are asking for some raises in the tariff as provided by the [Ho]use, and I will ask Mr. Frye to state the case.

The CHAIRMAN. We will be glad to hear him.

State, for the information of the committee, your full name.

Mr. FRYE. Edwin M. Frye.

The CHAIRMAN. Where do you reside?

Mr. FRYE. Harrington, Me.

The CHAIRMAN. What is your business?

Mr. FRYE. Blueberry canner.

The CHAIRMAN. Will you state to the committee your views the subject? What paragraph of the bill are you addressing yoursel to?

Mr. FRYE. To paragraph 737.

The CHAIRMAN. What is it you want there?

Mr. FRYE. We thought that the rates were not quite enough protection.

Senator SMOOT. You mean the evaporated?

Mr. FRYE. I am talking about blueberries—either in the berry or the canned berry.

Senator SMOOT. Berries, edible, are 1 cent a pound?

Mr. FRYE. Yes. A bushel of blueberries weighs 42 pounds.

Senator SMOOT. That is 42 cents a bushel?

Mr. FRYE. Yes.

The CHAIRMAN. What is it you want?

Mr. FRYE. We think we ought to have 1½ cents per pound inst of 1 cent.

Senator SMOOT. Are they worth $2.40 a bushel?

Mr. FRYE. Yes; they are worth more than that.

Senator SMOOT. How much more?

Mr. FRYE. The berries at the factory are worth about $3.5 bushel.

The CHAIRMAN. Are there many importations of these berries

Mr. FRYE. Well, there are some.

The CHAIRMAN. How many?

Mr. FRYE. Well, the importations ought not be great, becau two-thirds of all the berries that are packed are raised in Mai But there have been some importations.

Senator CURTIS. From Canada?

Mr. FRYE. From Canada.

The CHAIRMAN. Well, how many?

Mr. FRYE. Well, I think perhaps there have been 2 to 10 p cent importation.

Senator HALE. Please explain to the committee about openin the Crown lands.

Mr. FRYE. I was going to say that blueberries in Washingt County, Me., and in fact all over Maine, are sold for the best ber that grow. But there are 29,000 to 30,000 square miles in the State of Maine, bounded by Canada, and the idea in Canada is they are talking of opening up the Crown lands there for blueber In Maine, while the blueberry business is in its infancy here, we started to lay out a lot of money for raising them. In fact, have increased the capacity for raising blueberries 100 per ce the last five years, and they would be a great deal more than th the five years to come, because they have just got to work in shape. But they can raise blueberries in the Crown lands in Can which are near us. Washington County, Me., is bounded by Can where most of the blueberries grow—the whole north and east

Senator SMOOT. Are you a raiser of berries?

Mr. FRYE. Yes.

Senator SMOOT. You are not a manufacturer?

Mr. FRYE. Yes; I both raise and manufacture.

Senator SMOOT. Then I suppose you would want different rates rovided for the canned and preserved berries, would you?

Mr. FRYE. That rate of 20 per cent does not compare favorably ith the rate in 1909, when we had 35 per cent, because the price of lueberries has advanced. In 1909 No. 10 blueberries sold at $4.50 dozen; in 1920 they sold at $9.50, or more than twice as much; at is, the canned berry.

Senator SMOOT. Of course, then, the duty is more?

Mr. FRYE. Yes; but they are not more per cent.

Senator SMOOT. No; but more in dollars and cents.

Mr. FRYE. So we would like to have 25 per cent for the canned ıd 1½ per cent for the raw.

The blueberry growers of Maine have asked me to come before ɔu and to say that because of the outlay of labor and capital there Maine put out to grow blueberries they feel they would have have quite a protection until we get the industry further devel- ɔed than it is at present.

The CHAIRMAN. Have you filed any statement in writing?

Mr. FRYE. I have no brief, but here is a short statement from ısper Wyman & Son, Milbridge, Me.

The raising and canning of blueberries in the State of Maine is almost wholly done Washington County. The approximate sales of canned blueberries for this county r the business season of 1920 was $1,200,000, the product of 11 factories operating ere. There were blueberries also that were shipped fresh to the market in small ıxes packed in crates in addition to the above.

There are two factories in Hancock County and two in Knox County. The output these two counties would be about $240,000. There are blueberries shipped from ese counties in crates for the market, as in Washington County.

The farmers are just learining, in all the above counties, how to cultivate blueberries a large scale profitably, for this reason the production in the State of Maine is creasong each year.

The land used for this purpose is valued according to the quality of the land for ueberry production and also for the extent to which it has been cultivated for this rticular purpose. It varies, therefore, in value from $4 to $100 per acre.

Washington County borders on Canada, where there are quite a good many blue- rries raised, a large part of which come to the United States. The blueberries ere are raised on what is known as "the Queen's land on which no stumpage is arged. To allow these blueberries to be shipped into the United States on a tariff s than the McKinley tariff would be a severe blow to the industry here, an industry st in its infancy on account of the fact that, as above stated, the farmers throughout e sections where the blueberries grow are just learning to cultivate them success- lly. The crop in Washington County is gathered right after the haying season, at time when there is not much else going on. The pickers with their whole families ɔve right onto the blueberry fields and earn enough money there in from four to weeks to stock them up with their winter supplies.

Senator HALE. Mr. Chairman, I would like to state that while the ıty was a cent a quart in 1909 and is a cent a pound now, which nounts to 1⅓ cents a quart, yet the protection afforded is not as eat because the berries have gone up very much since that time. 1909 the price of berries was somewhere around 6 cents a quart, ıd now, as I understand it, you have to pay 8 or 10 cents a quart ıd sometimes more. Is not that true?

Mr. FRYE. The average price for the last three years has been 16 nts per quart, as compared to 6 and 7 cents in 1909.

Senator HALE. So the percentage that is allowed now is not nearly high as it was on the 1909 price, when berries were much lower.

The CHAIRMAN. The committee will give your statement very care- ıl consideration.

CHERRIES.

[Paragraph 738.]

STATEMENT OF HON. WESLEY L. JONES, UNITED STATES SEN- ATOR FROM WASHINGTON.

In the House bill the tariff on cherries is 1½ cents a pound, para- graph 738. I know that our cherry producers think that it ought to be at least 2 cents a pound.

Senator McCumber. That is the way that it is in the emergency bill.

Senator Jones of Washington. Yes.

Senator Sutherland. Is that the maraschino cherry?

Senator Jones of Washington. These are fresh cherries, or cher- ries in brine. Under the existing tariff law, or, rather, under a con- struction of the present law by the department, cherries sent here in brine were, I think, admitted free.

Senator Smoot. Yes.

Senator Jones of Washington. And that worked a very great hardship upon our people.

Senator Smoot. We have it here 1½ cents in brine or fresh.

Senator Jones of Washington. Yes; that is the way the House b[ill] is, fresh or in brine. Our people think the tariff ought to be 2 ce[nts] a pound.

I am just calling it to your attention. It was that way, as you s[ay], in the emergency bill.

Senator McCumber. I think it was raised to 3 cents in the eme[r]- gency bill.

Senator Jones of Washington. They think that 2 cents wou[ld] fairly well meet the situation.

Senator McCumber. Of course, you know that there has bee[n a] great deal of testimony here and there have been very earnest o[bjec]- tions to the increase of the tariff on cherries. You seem to la[bor] under one disadvantage, that you raise too good a cherry out the[re]; it is too big. You do not get near as many to a quart; and there[fore] when you want to put a cherry on the top of a piece of ice cream [or] something of that kind, if they buy a quart of foreign cherries t[hey] can cover so many more pieces with them that they are desirous [of] not allowing you, with your bigger cherries, to force them o[ut of] their smaller ones.

Senator Jones of Washington. I hope that you will help us keep up the size of our cherries.

STATEMENT OF JAMES A. RHEINSTROM, PRESIDENT OF T[HE] RHEINSTROM BROS. CO., CINCINNATI, OHIO.

Mr. Rheinstrom. The proposed tariff, on page 101, paragr[aph] 738, line 12, reads:

> Cherries in their natural state or in brine, 1½ cents per pound; maraschino ch[erries] and cherries prepared or preserved in any manner, 20 per cent ad valorem.

We produce in large quantities maraschino cherries, glacé cher[ries] and assorted glacé fruits, and already find ourselves in a po[sition] where we can not compete with the foreigners who are pa[cking] similar goods, which are entering the United States under [...]

nderwood tariff of 20 per cent ad valorem. This condition exists ith us even with using raw fruit that was purchased by us last ːar before the present emergency tariff was in effect, and that, as ɔu know, provides a duty of 3 cents per pound on cherries in brine, hich duty we continually opposed, but without avail.

As it is the intention of the revised tariff to protect American dustry and labor, we feel it our privilege as well as duty to ask ıat it be so drawn as to fill its purpose.

While the western grower thinks he will be benefited with a tariff ı raw cherries, he is laboring under a delusion, for the majority of e fruit imported is of a size that is not grown on the coast, the reign cherry being smaller, and therefore demanded by certain ade because it can be used to better advantage and more economilly, and if they can not secure from us they will import the finished ticle from abroad. We do, however, sell some larger cherries, nilar to the Royal Anne variety.

During the past summer I have seen some fresh Royal Anne erries offered on the Cincinnati market early in the season at $1 r pound retail, and, later, down to 50 cents per pound. With is condition existing I can see no reason why we, as American anufacturers, should be penalized, when the western grower reives such remuneration from this source, together with the demand r cherries for canning, which is of enormous proportions.

If we must pay duty on raw material it will mean that we will be aced in a position where we can not hope to compete with the reigner in our own market. He will process the fruit abroad and ɔd the finished article to the United States; we will be eliminated, d American labor will suffer through the loss. Thousands now gaged in the industry will be without employment.

To emphasize the point that the small-size fruit only grown abroad demanded by our trade, I am offering a price list, marked "Exhibit " dated February 1, 1921, which was published by one of the stern cherry preservers, in which the following appears:

Ve can also furnish ten to twelve hundred count Italian imported cherries, at 25 per gallon in 50-gallon barrels.

Upon glancing over this price list you will see that the price oted for the Italian imported cherries is higher than any quotan listed for any size of the large domestic cherries. The fact that ɪy are quoted at a higher price certainly is proof positive that competition of the imported raw cherries is not interfering in y way with the profitable growing of fruit on the coast. These lian cherries quoted by the western cherry packer were originally ported in brine, and cured on the coast. Why, then, should any ty be levied on raw material which will simply mean that the ckers will be driven out of business, and their products supplanted the finished cherries which will come from abroad?

The saying "One man's loss is another man's gain," will not work t to the advantage of the westerner, because by having us elimited he will be competing with the foreign packer of the finished oduct, as I said before, and if any gain is to be derived it will be to manufacturer abroad instead of the grower in this country.

It has always been our contention that, aside from the size of the it, insufficient cherries have been raised on the coast to satisfy the

requirements of this country. In evidence of this I am offering a telegram, dated July 6, 1921, which was sent to us by the largest fruit-packing concern on the coast in response to our inquiry for raw cherries, and which reads as follows:

Sorry advise does not look like will be position pack cherries account crop conditions which means shortage all over country. If successful securing necessary stock, etc., will advise but can not give anything definite. We regret these conditions and our inability take care your kind inquiry this instance. Accept our appreciation.

We feel that the tariff should be drawn eliminating the duty of a cent and a half per pound on raw cherries, and should provide for a duty on the finished article of 1 cent a pound and 35 per cent ad valorem, which was in effect under the Payne-Aldrich Act.

We positively need this protection on raw and finished fruit if we are to continue in the business, and not to have our years of work cast aside.

We know that our business is still in its infancy, and if the tariff is revised as we outline, it will be commensurate with our costs, and place American goods in competition with the foreign packed. We have superior articles that are worthy of such protection, that will guard their continued production.

GLACÉ, CANDIED, AND PRESERVED FRUITS.

[Paragraphs 738, 741, 745, 746, 747, 748, and 749.]

STATEMENT OF MARIO NARIZZANO, REPRESENTING THE CAUSSE MANUFACTURING & IMPORTING CO., BOUNDBROOK, N. J.

Mr. NARIZZANO. My name is Mario Narizzano, and I am vice president and general manager of the Causse Manufacturing & Importing Co., of Boundbrook, N. J.

The Causse Manufacturing & Importing Co. is the oldest American packer and manufacturer of glacé, candied, and preserved fruits. The plant of the company is located at Boundbrook, N. J. It pays the American scale of wages and employs between 75 and 100 people throughout the year. In addition to its direct operations the various allied trades are materially benefited, such as sugar refiners, corn products, box and paper manufacturers, American colors, etc.

The tariff act of 1913 seriously menaced all manufacturers of glacé fruits through the reduction of duties from the act of 1909, inasmuch as the larger proportion of glacé fruits were imported from France and Italy. The World War alone permitted American manufacturers to continue operations under the conditions of the act of 1913, because it made impossible the shipment of similar goods from France and Italy.

Senator SMOOT. Do you want the Payne-Aldrich rate, the same as Mr. Rheinstrom?

Mr. NARIZZANO. Yes, 1909.

Senator SMOOT. That is what you want?

Mr. NARIZZANO. Yes.

Senator SMOOT. You may proceed.

Mr. NARIZZANO. During the period of the war American manufacturers were called upon to supply American consumption in its entirety, thus necessitating a very large increase in their production, enlarging of plants, and consequent heavy investment.

The proposed tariff, H. R. 7456, in the various paragraphs covering acé and preserved fruits not only provides no relief, but apparently identical with the Underwood Act of 1913. In effect it practically eans ruin to the American manufacturers, because of the fact that ance and Italy have now resumed their exportations to the United ates, extensive in volume and at prices far below American cost of oduction. For example: French glacé cherries are being imported -day and sold in the American market at a price of about 25 cents r pound, duty paid. This price is at least 7 cents per pound lower an the American cost of production.

In our own case last year, on account of these renewed importations m France and Italy, we were unable to show any profit whatever our business. This year it is even worse, and we can not foresee ything but a substantial loss. It is thus apparent that American unufacturers can not continue to operate if the present or proposed ties are continued effective.

The act of 1913, as well as the preceding acts—1909, etc.—allowed importation of fruits in brine, which is the larger part of our raw terial (and not edible as imported), on the free list. The proposed R. 7456 not only follows the act of 1913 on the finished product, t imposes a further hardship on American manufacturers by placing luty upon fruits imported in brine.

It is thus easy to see that should the proposals of the bill H. R. 56 be enacted into law, including this duty on fruits in brine, the ect upon American manufacturers can not but be totally ruinous.

We protest that there should be any duty on fruits imported in ne. It is very essential to the American manufacturers that they permitted to import their raw material when necessary without burden of a duty, which immediately creates a material hardship to cost of production.

t is our recommendation, in which we believe we have the hearty port of every American manufacturer of glacé fruits, that the nimum duty on all glacé and preserved fruits be placed at 1 cent pound and 35 per cent ad valorem. In making this request of r committee we are merely asking that you reestablish the duty provided in the act of 1909, paragraph 274. We trust that the gment of your committee may give us even a greater measure of tection, because of the marked difference in costs and conditions between 1909 and the present time.

I. R. 7456, as at present written, seemingly presents marked ortunities for misinterpretation. Its division of paragraphs is arently full of ambiguities. Conflict is bound to follow. Under R. 7456 our industry is apparently spread out throughout numer- paragraphs, 738, 741, 745, 746, 747, 748, and 749 all applying. act of 1913 covered the subject fully and clearly under one para- ph (217), while the act of 1909 did likewise (paragraph 274). We estly petition your committee that all glacé fruits, preserved or ked in sugar or having sugar added thereto, or preserved or ked in glucose, molasses, spirits, or their own juices, be covered er one paragraph.

it should be the decision of the committee that it is essential for d or revenue purposes that a duty be imposed on the importation ruits in brine, then we earnestly petition that a further differ-

ential be established which will give the American manufacturer protection equivalent to the amount of such duty on fruits imported in brine.

In conclusion, gentlemen, I wish to add my emphatic indorsement to the remarks of Mr. J. A. Rheinstrom, of Cincinnati, made at the hearing yesterday afternoon. On account of the lateness of the hour when Mr. Rheinstrom was heard, I fear that some of the effectiveness of his testimony may have been impaired. All of us who import cherries in brine for the manufacture of glacé cherries and cherries in sirup (so-called maraschino cherries) believe our situation is one calling for the earnest support and consideration of your honorable body. American production is totally inadequate, and it is in fact impossible to purchase for this purpose more than a very small percentage—less than 10 per cent—of the needs of the country. Pacific coast cherries are largely sold as fresh fruit. I wish to call your attention that the normal consumption of the United States of this commodity—imported in brine—not edible as imported—75,000 barrels. The proposed H. R. 7456 rate of 1½ cents on cherries in brine is in effect a duty of 3 cents per pound to American manufacturers of glacé or sirup cherries, as the pits, stems, shrinkage and sundry losses practically double the rate of duty. We again request that your committee place fruits in brine on the free list, as it is a raw material necessary.

CURRANTS.

[Paragraph 742.]

STATEMENT OF J. E. BRAND, REPRESENTING THE W. H. MARV[...] CO., URBANA, OHIO.

Mr. BRAND. I am here in place of Mr. Charles Brand.

Senator LA FOLLETTE. What paragraph do you speak on?

Mr. BRAND. I am speaking on paragraph 742, and the subject [...] currants. At least 99 per cent of the currants are imported, a[nd] for that reason I would judge that the duty is one for revenue sole[ly]. There are about 15,000 tons of currants imported into the Unit[ed] States a year, taking an average of over 10 years; and it does [not] seem we will be able to import that many if the duty is made [...] cents. About the only thing we are directly in competition wi[th], we might say, is raisins, and they have only placed a duty of 2 ce[nts] a pound on raisins; and it seems unreasonable when raisins are t[he] chief competitor of currants that a competitor should be charg[ed] 2½ cents and damaged in the business that would be done, and [at] the same time it seems to me there has been overlooked an oppor[tunity] to protect an industry in the United States, that of clean[ing] currants, which is one that amounts to $4,500,000 a year, in [not] making the duty higher on cleaned currants coming into the Unit[ed] States than it does on the uncleaned or original. These curran[ts] come in here in a dirty condition, and we pay duty not alone on t[he] currants, but on the dirt imported with the currants. Many tim[es] we have tried to have relief from that and ask that we would [be] allowed a percentage that would mean 3½ per cent, which is wha[t we] clean out of the currants. So that we not alone are paying 20 [...] per cent ad valorem duty in 2½ cents, but we would be paying 3 [...]

at besides on the dirt imported, which, of course, we can not sell, at least we ought not to.

The increase in duty would produce increased revenue of $300,000 to e United States, provided we were able to import the same quality of rrants we have heretofore. But I doubt that we will be able to. the present time the ad valorem duty amounts to 20 or 30 per cent, t if we go back to prewar conditions on both raisins and currants, we ll have a price of 4 to 6 cents a pound on them, and then the ad lorem duty would be so great as to make it prohibitive, for you can idily see that at a price of 4 cents, deducting 2½ cents would not leave ything for the freight or for the currants hardly. We have never d a higher duty than 2 cents a pound on currants, and it does not m there is any reason to-day for making any detrimental increase in ty to prohibit the use of currants in this country. There are a eat many people here who want currants, and inasmuch as they are t grown in this country—at least not in any degree that would be ficient at all—I understand they have sold some 30,000 pounds year in California, but no one has been able to get hold of any nples, and we do not know whether it has been done. Burbank ed to grow currants in California; he produced them in Florida d warmer climates and acknowledged them a failure.

We would like to see a higher duty on cleaned currants than there on the uncleaned, as a protection to an industry that has been ilt up here, because over there we have these same labor conditions at you have all heard of in great quantity here on every subject of import nature; and we have these same troubles to compete with, d where people want currants—we have a great many people come re from England and who come here from Greece who are used to ving currants, and they want them, and I can not see that we have y reason for making it hard for them to obtain them, and we have e industry here and ready to take care of this business.

Gentlemen, I have come as a substitute for Mr. Charles Brand, and as called by phone from Pittsburgh last night, and I am here without any data and information, and I would like to submit a brief.

The CHAIRMAN. That will be satisfactory to the committee.

LEMONS AND ONIONS.

[Paragraphs 743 and 768.]

STATEMENT OF FREDERICK W. GEIGER, NEW YORK CITY.

Mr. GEIGER. I reside in New York City, and my name is Frederick Geiger. I appear in the place of Mr. Lippmann, who was sudnly taken sick and could not be here. I would like to file se two memoranda on the subject of lemons, covered in paraph 743, and onions, covered in paragraph 768.

Senator McCUMBER. The briefs will be printed.

BRIEF OF THE NEW YORK FRUIT EXCHANGE.

he New York Fruit Exchange does not oppose the tariff duty of 2 cents a und on lemons, as provided in the emergency tariff bill and the proposed permat bill as passed by the House of Representatives, because of hostility to the wers of lemons in the State of California.

he membership of the New York Fruit Exchange represents all branches and ments of the wholesale fruit trade.

majority of the members of the exchange derive their principal revenue from ling in California fruits. Thus self-interest alone, if no patriotic or other higher

motive, would restrain them from taking or recommending any action which w be detrimental to the interests of the California producers.

The New York Fruit Exchange is opposed to the increase in the tariff duty fro cents a box (approximately one-half of a cent a pound to 2 cents a pound, or appr mately $1.50 a box) because of a conviction that such an increase is unwarra that as long as such a law remained in force it would give to the California gro a monopoly of the traffic in lemons in the United States; that the effect of su monopoly would be to give to the California producers and operators an oppor to manipulate the market at will, thus compelling consumers to pay inordin high prices for lemons, or go without them; and that lemons being a necessity not a luxury, no action should be taken by the Government to artificially rai price of them.

The New York Fruit Exchange opposes a duty of 2 cents a pound, too, beca a belief that in the long run it will prove to be disastrous to the California prod themselves. It will create false hopes founded upon a mistaken sense of securit lead to speculation in land at advancing prices, thus adding to the already too hi cost of production and provoking resentment upon the part of the masses of the peo which in time will find expression in reprisals.

This is not merely a theory. One need but read the tariff history of our cou to perceive that such an unstable thing as a rate of duty is a dangerous founda for a great industry. The folly of erecting a tall and heavy structure on a foundat of sand is proverbial.

What is the history of the tariff on lemons?

Roughly speaking, the California lemon industry is hardly 30 years of age. In brief period of time the rate of duty has been changed five times.

Setting the period of the beginning of the industry as a commercial fa second administration of President Cleveland, say 1892, we find the duty scribed in the Wilson bill the equivalent of about 30 cents a box. The ind grew slowly at first, but steadily. In 1897, after the inauguration of President M ley, Congress undertook a general revision of the tariff.

Representatives of the California industry petitioned for a duty of 1 cent a p When the tariff bill known as the Dingley bill passed both Houses of Congr carried a duty on lemons of three-quarters of 1 cent a pound.

The industry flourished, as is shown by the yearly increased output. T porters of lemons and dealers in fruits throughout the United States adjusted business to the new conditions and accepted the matter as settled. There w thought of asking for a repeal of the provision of the bill or of a restoration former low rate. But it soon appeared that the California growers were not In the year 1909, after the inauguration of President Taft, there was another of the tariff. The Californians, apparently emboldened by their former asked that the duty on lemons be increased to 2 cents a pound. They did all they asked for, but the duty was substantially increased. It was doubled Payne-Aldrich bill was passed, which fixed the rate of duty at 1½ cents a po the equivalent of about $1.15 a box.

The Californians were warned that reprisals would follow, but they disregard warnings and went ahead as if the matter were settled for all time. Some thre later there occurred a great disaster. A cold wave of unprecedented intens duration swept over the citrus-fruit producing sections of California and the crop was practically destroyed. Then it was that the fruit trade of the coun observing consumers learned the effect of high tariff duties. Lemons were im but in no such quantities as they would have been had the operations of the im not been restrained and limited by the excessive duty. Lemons sold cons above the normal prices. Consumers whose incomes permitted them to do lemons. They grunted, but they paid the price. Those who could not pay t went without lemons. Congress met. The Democratic Party was in contr was another revision of the tariff; this time it was downward. In the Und bill the duty on lemons was fixed at 35 cents a box. The protests of the interests were unavailing. Dire predictions were made as to the destructi industry. But let us see what actually resulted. In the season of 1913- carloads were shipped. The next season the shipments were 6,851 carlo 1915–16 the shipments rose to 7,200 carloads. The maximum was reached season of 1918–19, when 10,923 carloads were shipped. These figures repres the shipment to points within the United States. In the same period there steady growth in the export business. In the season of 1913–14, 70,075 bo exported. In the season of 1918–19 the export shipments reached a total boxes.

Here we have evidence of a healthy growth, yet the spokesman of the Cal growers would have us believe that unless protected by a tariff of at least 2 pound the industry will be ruined.

n a brief of the California Citrus League, which was submitted to the Ways and ans Committee of the House of Representatives (p. 1937 of the hearings on general iff revision), it is stated that—

'The bearing lemon acreage in California was largely planted as a result of the nulus that followed the tariff duty of 1½ cents per pound in 1909, when the Citrus otective League promised * * * that if given the protection asked for, Califor- would supply the entire lemon demand of the country. The 33,000 acres of ring trees, which now more than supply the requirements of the United States, re therefore planted before the duty was reduced to one-half cent per pound in 3, and as a direct result of the encouragement given by the higher rate."

'his statement merits examination, especially as to two important particulars. elve years ago a duty of 1½ cents per pound was found to be sufficient stimulus encourage an enormous increase in the acreage planted to lemons. This being a t, why is it now necessary to raise the rate to 2 cents a pound?

'he other particular in which the verity of the statement is challenged by recent erience is the assumption that the promise made in 1909 that if given protection he extent of 1½ cents per pound "California would supply the entire lemon demand the country" has been fulfilled. To refute this assumption one need but recall trend of the prices for lemons during the period extending from the latter part of month of May in the present year to the latter part of the month of July. A warm ve in the interior of the country which moved east and spread over a vast area, ated the usual hot-weather demand for cooling drinks. It came at a time when wholesale trade had few lemons in stock and only insignificant quantities of foreign ons were in transit, because the fear of the passage of the emergency tariff bill l restrained the importers from making their customary spring contracts. What s the result? The prices leaped upward in jumps of $1.50 to $2.50 a box at each cessive auction sale. At the crest of the wave, some California lemons sold at ction in New York City above $15 a box. Prices ranging from $10 to $12.50 a box re common.

Such imported lemons as were received also sold at the highest prices within the mory of present-day operators. The prices ranged anywhere from about $7 to 1.50 a box according to quality and condition. And the retail prices soared in npany with the wholesale prices. Consumers were compelled to pay from 75 cents $1.25 a dozen.

California was clearly unable to supply the demand. The prices did not recede normal levels until lemons were received from the Mediterranean, which the high ces had encouraged the trade to import.

At present (Aug. 29, 1921) California lemons of fancy grade are bringing $5 a box, d those of choice grade are selling up to $4.50 a box in the New York auction rooms. the last sale of imported lemons, which was held on August 25, the prices ranged m about $2.50 to $3.50 a box, according to quality and size.

n the entire period extending from June 1, 1921, to July 18, 1921, when the demand lemons was greatest, there were sold in the city of New York only 40 carloads out 16,000 boxes) of California lemons, all rail shipments, and 30,800 boxes which re shipped by water by way of the Panama Canal. One of these cargoes, which sisted of 10,000 boxes, sold at auction at an average price of more than $10 a box.

Additional facts and figures almost without limit might be cited in refutation of the im that a prohibitive duty is needed to save the lemon industry of California from inction, but enough has been submitted to prove conclusively that the industry grown enormously in comparatively few years and that no further protection is ded. But despite the conviction that the lemon industry of California is strong ugh to stand alone without any protection at all in the way of a duty on imported ons, the New York Fruit Exchange does not ask for a removal of the duty, nor n for a restoration of the rate of 35 cents a box as provided by the Underwood iff bill. As a whole, the members of the New York Fruit Exchange believe in the nciple of protection to home industries and they regard the imposition of tariff ties upon imports from foreign countries as a proper source from which to procure revenue needed to defray the necessary expenses of government. Hence they ieve that the duty on lemons may properly be raised, but that it should not be sed so high as to exclude imports and compel our own people to pay extravagant ces. They believe that the principle of protection should be extended to the sses of consumers and that it should not be limited to a selected few in favored lustries. In their opinion the duty on lemons should not be raised above the equiv- nt of about 75 cents a box. This rate of duty would afford ample protection and couragement to the growers of California while making it possible to import lemons m the Mediterranean without great hazard at times when the production of Cali- nia should be found to be inadequate to supply the demand.

BRIEF OF THE NEW YORK FRUIT EXCHANGE AND ASSOCIATED ORGANIZATIO[illegible]

LEMONS.

Paragraph 220 of the act of 1913 is as follows:

"Lemons, limes, oranges, grapefruit, shaddocks, and pomelos in packages [illegible] capacity of 1¼ cubic feet or less, 18 cents per package; in packages of capacity exc[illegible] ing 1¼ cubic feet and not exceeding 2½ cubic feet, 35 cents per package; in packag[illegible] exceeding 2½ and not exceeding 5 cubic feet, 70 cents per package: in packages [illegible] ceeding 5 cubic feet or in bulk, one-half of 1 cent per pound."

Lemons can not be classed as a luxury, nor as merely a pleasant article of a civili[illegible] dietary. They are a necessity. In the treatment of febrile disorders and other f[illegible] of sickness, they are indispensable. Nothing should be done to deprive the consu[illegible] of such a wholesome and necessary article of diet, of medicine, and toilet, or in[illegible] nately to raise the price.

The traffic in imported lemons furnishes employment to thousands of our citi[illegible] and is a source of no inconsiderable revenue to the Government of the United Stat[illegible]

There is current a great deal of misinformation as to the cost of importing lem[illegible] So much has been said in the past as to pauper labor, that the labor cost of produc[illegible] in foreign countries is erroneously regarded as an infinitesimal item. Yet the fa[illegible] that in Sicily, where virtually all the lemons imported into the United States [illegible] grown, wages have risen fully 300 per cent above the rate paid before the late wa[illegible]

The proximity expense of delivering a box of lemons from Sicily to the port of N[illegible] York is as follows:

Lighterage in Sicily	$0[illegible]
Freight (3 shillings 8 pence)	[illegible]
Insurance	[illegible]
Duty, fees, etc., 35 cents a box, plus an ad valorem duty of 15 per cent on the shooks, when of foreign manufacture)	[illegible]
Wharfage, about	[illegible]
Cooperage, average	[illegible]
Total	1[illegible]

The present depreciated foreign currency is not an advantage to the foreign shipp[illegible] for they buy what they need at home with depreciated currency, and are compel[illegible] to pay in gold for the shooks, paper, nails, and fertilizer, which they import from o[illegible] countries.

The expense of delivering a box of lemons from Sicily to the port of New Yor[illegible] shown to be $1.48 exclusive of the cost of the fruit. But high as it is this amount [illegible] not represent the cost of delivery to the average dealer who supplies the consum[illegible] To ascertain this cost, there must be added the shipping charge at the port of N[illegible] York and the freight from New York to the interior destination. The center of p[illegible] lation may be stated roughly to be at Indianapolis, Ind. The rate of freight on lem[illegible] from New York to Indianapolis is 87½ cents per 100 pounds, which is the equiva[illegible] of 72 cents a box. The shipping charge at the port of New York varies from a minim[illegible] of 7 cents a box for lightering, to a maximum of 25 cents a box for cartage from o[illegible] docks. Placing the average charge at the low figure of 10 cents a box, it will be [illegible] that the expense incurred in delivering a box of lemons from Sicily to the cente[illegible] population in the United States is $2.30, exclusive of the cost of the fruit.

Sicily, as stated in the foregoing, is virtually the sole source of imports of lem[illegible] Following is a table showing the volume of importations for a period of eight year[illegible]

	Box[illegible]
July 1, 1912–13	2,07[illegible]
July 1, 1913–14	2,3[illegible]
July 1, 1914–15	2,2[illegible]
July 1, 1915–16	1,4[illegible]
July 1, 1916–17	1,3[illegible]
July 1, 1917–18	1,2[illegible]
July 1, 1918–January, 1919	31[illegible]
Calendar year 1919	1,0[illegible]
Calendar year 1920	1,41[illegible]

The price of imported lemons varies according to the season. It is regulat[illegible] the law of supply and demand. The lowest price is equivalent of about $1.50 an[illegible] highest price the equivalent of $5 a box f. o. b. Sicily. Reckoning over a per[illegible] years, the seasonal average cost is about $2.50 f. o. b. Sicily.

Other elements besides price enter into the equation. The importer must tak[illegible] consideration the hazards of an ocean voyage and the probable market fluctua[illegible]

etween the date of purchase and the date of arrival at the port of entry into the nited States.

The domestic production of lemons has not languished for want of a high protective riff. As a matter of fact and of record, the industry has shown a steady and healthy rowth.

The following table shows the annual shipments from California during the periods ated:

	Carloads.		Carloads.
912–13	2,192	1916–17	7,914
913–14	2,954	1917–18	6,331
914–15	6,851	1918–19	10,923
915–16	7,200	1919–20	9,029

In the period from 1912 to about 1917 a carload consisted of 312 to 336 boxes. In he later periods the average car contained 404 boxes.

Until the year 1912, practically, all the lemons grown in the United States were onsumed in this country. In the year 1912 the exports became of sufficient volume o warrant the compilation of statistics. The growth of the export business is shown y the following table:

	Boxes.		Boxes.
912–13	81,949	1916–17	174,938
913–14	70,075	1917–18	138,351
914–15	122,914	1918–19	304,351
915–16	175,070	1919–20	276,519

Appended hereunto is a statement showing the high and low prices realized for mported and California lemons in the city of New York during the period extending from January 1, 1920, to December 31, 1920.

The fruit trade of New York City is in no sense hostile to the protection and encouragement of domestic industries through the imposition of tariff duties on articles of foreign manufacture. They believe in the principle. But they feel that tariff duties should not be raised so high as to exclude foreign commodities altogether, thus depriving the Government of revenue and imposing unwarranted burdens of taxation upon the consuming public. They believe that if the present rate of duty on lemons were increased, say, 50 per cent, it would afford ample protection to the domestic producer and make it possible to import sufficient lemons to supply the wants of our people in periods of scarcity caused by the partial, or complete, failure of the domestic crop. Should an excessive rate of duty be imposed, there would be no importations at all in normal domestic crop years, and the importations in the years of domestic crop failure would be so limited in quantity as to deprive the consumers at large of lemons, for the prices under such conditions would rise so high as to place the fruit beyond their reach.

The imposition of a prohibitive duty on lemons would also be unjust to a friendly nation, and the principle of excluding the products of other countries through the medium of excessive tariff duties might invite reprisals which would seriously menace our growing foreign trade.

A tariff of 2 cents per pound as a minimum rate would be absolutely prohibitive and would be an increase of approximately 400 per cent on the present duty. At this point the attention of the committee is called to the fact that west of the Mississippi River, where there are no auction sales of lemons, buyers have to pay the price asked for California lemons, and the freight rate from New York makes it impractical in that section of the country to purchase Sicily lemons.

Attention is also called to the fact that recently about 2,500 boxes of California oranges and lemons were sent via the Panama Canal to Philadelphia, and the lemons were reported to have arrived in a very satisfactory condition, and, in fact, better than the oranges. If this method of transportation proves successful, there will be quite a saving in the freight as compared with all rail.

Reference has been made to the fact that the year 1920 was a prosperous one for growers of Sicily lemons, but it was anything but prosperous for importers, whose losses were heavy and continuous, for the tabulation annexed hereto shows clearly the small prices obtained for Sicily lemons and part below the cost price. Among the many charges not heretofore referred to may also be mentioned shipping charges, varying from 7 to 25 cents per box, and brokerage of 10 cents per box if bought at auction.

So far as the tariff is concerned, it is understood that the only desire is to produce revenue, but at the same time it is not believed that that desire to produce revenue extends to the point of prohibiting importations entirely, because if importation is prohibited, clearly there is no revenue from the tariff.

Our attention has been directed to an alleged statement that the cost of produ[illegible] California lemons is $4.57 delivered in New York, while the average selling pric[illegible] period of 16 years has been $3.92. It needs no argument to show that this can no[illegible] correct, because no one can believe that in 16 long years business would be don[illegible] completely at a loss, and if it were true, what is to be said of the statements o[illegible] representatives for California that the production of lemons has increased, w[illegible] promise of production equal to 7 million boxes?

Following is a statement of the prices obtained in 1920, which shows clearl[illegible] the prices for California lemons were greater than those obtained for Sicily lemons

Weekly prices of California and Sicily lemons, calendar year 1920.

ONIONS.

nions: Paragraph 208 of the act of 1913, 20 cents per bushel of 57 pounds. No nge in rate is desired. An endeavor will be made in a brief way, to outline reasons y an increase in the present tariff on Spanish onions would completely eliminate commodity from being imported into this country. The quantities imported ing the past few seasons are as follows:

	Crates.
-15 (40,907 cases)	454, 519
-16 (72,218 cases)	527, 266
-17 (176,931 cases)	1, 310, 939
-18 (239,799 cases)	1, 092, 229
-19 (275,370 cases)	1, 035, 475
-20 (304,285 cases)	1, 102, 024
-21 (10,378 cases, 22,211 half cases)	73, 981

would be well to note how small the importations of Spanish onions compare the domestic crop. Nevertheless, it amounts to a very large percentage of the l quantity which Spain exports.

uring the seasons of 1916-17 and 1917-18 Spain exported the following quantities:

	Crates.
-17 (2,409,685 cases)	1, 135, 219
-18 (1,526,090 cases)	1, 112, 029

is country purchased all the crates and a large portion of the cases.

e average crop of domestic onions in the United States for the year 1918 was 0 cars and for 1920 it was 28,000 cars, at an average of 600 bushels per car, and ld thus equal 16,800,000 bushels for 1920 and 21,000,000 for 1918. This com-on is illuminating.

word might be said on the increased cost of Spanish onions during the period ring the last four or five years. Experienced labor could be secured at one time pain for 2 pesetas, or 40 cents a day. This has increased to 4 pesetas and in some icts to 5 pesetas per day. The cost of packing has increased 100 per cent, as well e freight from Spain to New York. We are paying 4½ pesetas per case at the nt time, while previous to the war we frequently secured rates of 1½ pesetas per (pesetas figured at 20 cents each). Labor, packing, etc., has increased in the same ortions.

anish onions are easily recognized by the American trade inasmuch as they are ys packed in crates and cases and never in bags. The only foreign onions packed gs are the Egyptians, but these onions do not cut any figure as they only come when the market is very strong and when there is a scarcity of both Spanish and stic onions in this market. From statistics we find that the largest importations yptian onions were made during the season 1920, the total amount being 75,000 of 100 pounds each.

it were only a question of looking out for the interests of the United States, we d without a doubt agree to an increase of the tariff—that is, if only the American r were to be considered—but we must not forget the effect that the increased would have on the American public, as well as upon our foreign friends.

s well to bear in mind that Spain, which, it is true, was a neutral country during var. supplied great quantities to our troops, and in some districts of Valencia e these onions are grown such heavy demands were made that the Spanish public the sufferers.

w, if we are in turn going to show our appreciation for what they did for us by ving them of an outlet for a large quantity of their goods, it will produce a ncy to shun us in some way or other.

may be here noted what Mr. Arthur N. Young, trade commissioner, writes in the entitled "Spanish Finance and Trade," Special Agents Series No. 202. In ssue he calls our attention to the necessity of creating a demand for American in Spain, and points out the wonderful strides American goods have made in since 1914. If we are to hold this trade, which is an essential one, certainly we do something in the reciprocity line.

nkly speaking, it would be suicide for the onion growers to attempt to pay an ased duty over what they are at present paying.

ere is another good reason why the tariff should be reciprocal, and that is that Spanish onions do not conflict in any way with the domestic, owing to the ent qualities of the onions, it protects the consumer from paying fabulous prices as occurred in 1916. In that year it is distinctly remembered that a com-e of women stormed the city hall in New York City protesting against the high

prices of domestic onions. This was due to the fact that domestic jobbers [illegible] to corner the market. Nothing was accomplished in the way of reducing [illegible] the public until the Spanish onions arrived in the market, and when this [illegible] the domestic jobbers were forced to do the proper thing and supply the [illegible] onions at fair prices.

It might be well to add something regarding the quality of Spanish onions. [illegible] onions are very large and contain a considerable amount or water, and for this [illegible] it is the only onion that might be called "sweet," and are seldom if ever [illegible] cooking purposes. Since Spanish onions are of such a superior quality to the [illegible] they are largely used for a different purpose. Spanish onions are so large [illegible] packers are able to classify them by sizes and pack them in crates containing [illegible] 72 onions, size of the crates being the same. The onions are also packed in [illegible] according to size; the larger sizes being packed in cases containing four onions [illegible] tier and the smaller ones five to a tier. The weights of the different size [illegible] are as follows:

	Gross pounds.	[illegible]
Crates	48	[illegible]
Half cases	76	[illegible]
Cases	150	[illegible]

The duty is paid at the rate of 20 cents per bushel of 57 pounds, which figures [illegible] approximately: Crates, 15 cents; half cases, 22 cents; cases, 45 cents.

One more fact might be pointed out, and that is that "necessity is the mother [illegible] invention." This statement is made because one of our members, Mr. A. Boera [illegible] Boera Bros., the largest importers of Spanish onions, who imported during the [illegible] of 1919-20 some 347,000 packages, states that while in Spain during the war [illegible] impossible for the United States to supply Spain with cotton, Spain being the [illegible] largest buyer of cotton from the United States. Due to this condition Spain [illegible] thinking very seriously of planting cotton in the most suitable section of Spain [illegible] happens to be in the Valencia district where the onions are now grown. There [illegible] question but that cotton can be grown in Spain, but it would be rather a hard [illegible] tion to change the mode of a country from one industry to another. If we are to [illegible] a higher tariff on onions Mr. Boera fears it will cause the Spanish Government [illegible] again reconsider the possibilities of taking up cotton growing. Should this be the [illegible] our country would be deprived of the import duty on onions and also of an outlet [illegible] our cotton.

England, during the war, very foolishly refused Spain quantities of coal, and [illegible] result has been that Spain was forced to drill for coal in her own country. Spain [illegible] therefore, during the war increased its coal production from 1,000,000 to 7,[illegible] metric tons, and from recent reports it will be only a question of time when Spain will be able to supply its own needs.

As in the case of domestic growers, Spanish growers were forced to take very [illegible] losses in America due to the fact that the elements play such an important part [illegible] this commodity. For instance, in all seasons from 1917 to the present one not [illegible] shipper made any money in shipping onions to the United States. To substantiate this fact, the books of any one of the Spanish onion importers are open to inspection, and under these circumstances what will be the result if an increased duty [illegible] effect?

The Spanish onions do not in any way conflict with the Texas onions, as it has been stated that "Texas onions arrive in the New York market between April and [illegible] and then the Northern States supply the onions." Statistics show that it is [illegible] seldom that Spanish onions are imported during July, so that prices of Spanish [illegible] do not in any way conflict, at least with Texas onions.

From information obtained we understand that domestic onions can be delivered to railroad station for $1.40 per 100 pounds. Figuring that if the freight [illegible] imported onions was half of the railroad charges on 100 pounds, the Spanish [illegible] ers would be losing money at $1.40 per 100 pounds delivered on steamer. Entries at customhouse will substantiate these facts.

BERMUDA PRODUCTS.

Potatoes: Paragraph 581, act of 1913, duty free.

Onions: Paragraph 208, act of 1913, 20 cents per bushel of 57 pounds.

It is respectfully urged on behalf of the merchants doing business with Bermuda [illegible] that no change be made in the tariff on potatoes, onions, and other vegetables [illegible]

om Bermuda. A very large percentage of the Bermuda crop is shipped to the New 'ork market at a time when there are practically no new potatoes or onions grown in ıe United States and ready for shipment, and, consequently, the shipments from ermuda do not in any way interfere with crops of new potatoes and onions grown in ıe United States.

Attention is called to the fact that these new potatoes and onions, as well as early egetables, have been grown especially for the New York and other large markets in ıe United States for the past 20 years or more; and coming forward at a time when ıch goods can not be grown in the open fields of this country, it is therefore necessary r the receivers here in the United States to look to Bermuda for their supplies of new otatoes and onions.

The total shipments of new potatoes, onions, and vegetables from Bermuda to the nited States each season are very meager and limited as compared with the production of such goods grown in this country, and the bulk of the Bermuda shipments rives on the New York market between December 1 and April 1.

The approximate output of potatoes for the last eight years has been 153,000 bushels er annum, although at times the output has been between 100,000 and 125,000 bushels er annum.

Attention is also directed to the fact that the bulk of the seed, fertilizer, containers, ıd other materials required in the growing and shipping of these crops from Bermuda iginates in the United States and is shipped to Bermuda for the sole purpose of owing and shipping these crops to the United States markets.

In this connection it is interesting to note that, according to the Department of ommerce statistics, during the 10 months ended October, 1920, the exports from the nited States into Bermuda amounted to $3,320,338 and imports from Bermuda into ıe United States amounted to only $1,532,428, making a trade balance in favor of ıe United States of $1,789,910.

GRAPEFRUIT.

[Paragraph 743.]

TATEMENT OF JAMES D. POTTS, GLEN RIDGE, N. J., REPRESENTING ISLE OF PINES CITRUS FRUIT GROWERS.

Mr. Potts. Mr. Chairman and gentlemen of the committee, I repesent the citrus-fruit growers on the Isle of Pines. I am also engaged ı the industry there as a grower. I desire to present, if I may, for onsideration by your committee, a brief statement giving reasons 'hy an increased duty on grapefruit is not required for protective urposes, and should the amount in the new tariff bill stand it would e nonproductive as a revenue measure, for it would act as an emargo. This conclusion is based upon our experience in marketing ur grapefruit last season.

The present duty on grapefruit is 35 cents per box, less 20 per cent rovided in the reciprocity enactment, which reduces the amount to 8 cents per box. The duty of 1 cent per pound which the new 'ordney bill would impose on grapefruit amounts to about 70 cents er box.

Senator Smoot. Where do you live?

Mr. Potts. Glen Ridge, N. J.

Senator Smoot. You sell grapefruit? Do you import grapefruit om the Isle of Pines?

Mr. Potts. No; I am a grower there.

Senator Smoot. You are a resident of the United States?

Mr. Potts. Yes, sir.

Senator Calder. You are a citizen of the United States?

Mr. Potts. Oh, yes.

Deducting the 20 per cent reciprocity, the proposed rate is reduced o a duty of 56 cents per box, thus making an increase of 28 cents per ox above the present duty cost.

Last season it cost me, in freight, duty, boxes, picking, packing, packing materials, hauling to the docks, and selling charges. $4.2 per box, laid down to the buyer in New York City.

The highest average price obtained in the New York market for an entire orchard crop was $4.85½ per box, leaving a margin of 64 cents per box, against which must be charged the cost of fertilizer and labor applied on the orchard, and these charges in the best bearing groves will run above 65 cents per box, and in the young bearing orchards it will cost above $1 per box to grow the fruit.

In view of the high cost of transportation, fertilizer, and labor and other materials we will not be able to take on this additional duty charge. If the increase remains in the bill we feel we will have to quit growing grapefruit, and sacrifice our investments. The investments, in some instances, reach large figures. Mr. F. C. Stephens manager for the Federal Printing Co., of New York, has an investment of over $100,000 in a grapefruit orchard. Last season Mr. Stephens did not break even, as will be observed in his statement herewith submitted.

We have gone through the hard struggles of the pioneer, and we do not want to be forced to give up.

We hold that a duty on grapefruit is not needed for protective purposes, for the following obvious reasons: Last season Florida shipped 4,549,950 boxes of grapefruit. The Isle of Pines shipped 164,2 boxes of grapefruit, Cuba shipped about 45,000 boxes, and Jamaica shipped about 20,000 boxes; making a total of about 229,249 boxes of grapefruit coming in from outside points.

Senator CALDER. Are grapefruit raised in other places in the country besides Florida?

Mr. POTTS. California raises some, but not to a large extent. Porto Rico, which is an American possession, raises grapefruit.

The bulk of this 229,249 boxes of outside fruit is shipped in August, September, and early October, before Florida begins to ship in quantities. Thus it will be seen that our small quantity of fruit, most which is shipped before the Florida fruit is ripe, can have no influence whatever upon the grapefruit market. In fact, the Isle of Pines shipped but 11,412 boxes of grapefruit in the months of November and December last, which are the months of heavy shipments from Florida.

Last season the freight charges from the Isle of Pines via Key West to New York were $1.82½ per box. By water route via Habana the rate was $1.23½ per box. From the Isle of Pines to Chicago the rate was $1.71 per box.

Fully two-thirds of our crop last season was shipped at the $1. and $1.82½ per box rate.

Florida paid from Tampa to Chicago, $1.07½ per box as against the Isle of Pines rate to Chicago of $1.71 per box, giving Florida market advantage of 63½ cents per box. Adding the present duty of 28 cents per box increases this advantage in favor of Florida the Chicago market to 91½ cents per box. Adding the proposed increase in duty of 28 cents per box would advance the Florida shippers advantage in the Chicago market to $1.19½ per box.

About half our shipments to New York last season were sent the way of Key West at the $1.82½ per box rate, therefore the avera

te paid for delivery in New York from the Isle of Pines was $1.53 r box.

The maximum rate paid by Florida shippers to New York last ason was from the Miami shipping point, which was $1.26½ per box. om Palmetto on the west coast the rate to New York was $1.08½ r box last season. From interior points the price was considerably wer.

Desiring to be conservative and fair in our statement, we have lected for comparison the maximum rate paid by the Florida ippers. By striking an average the rate last season from Florida New York was about $1.17½ per box as against the average rate New York from the Isle of Pines of $1.53 per box, which gives the orida shipper a market advantage in New York of 35½ cents per x in freight rate alone. To this add the present duty of 28 cents r box and the amount totals 63½ cents per box market advantage favor of the Florida shipper. If the duty be increased an additional cents per box, it would raise the rate to 91½ cents per box, which nount the Isle of Pines grower must pay to lay his fruit down in ew York in excess of what the Florida shipper would pay.

We hope in the future to obtain freight concessions. So does orida. So does the country generally. That, however, would ange only the rate amounts and the Isle of Pines grower would ill have to pay proportionately the same higher rate. The big ctor, the duty, would still remain.

We ship our fruit to the West, Middle West, and East in about ual quantity, therefore we will always have to pay in excess of the orida shipper the amount of the charges from the Isle of Pines to ey West.

Besides, we pay $15 per ton more for fertilizer than Florida growers y. We buy our boxes in Florida and, of course, pay the delivery arges on them. These items together with other supplies, implements, etc., which are all purchased in the States and upon which duty must be paid, will bring our cost up to at least $1 per box in cess of what Florida pays to lay the fruit down in the New York arkets.

Further, the wholesale fruit merchants do not care to handle the le of Pines grapefruit when the Florida grapefruit is ready for marting. Their business interests naturally lie with the Florida owers, who give them between four and five million boxes of grapeuit annually, as against the outside growers, who can give them it two to three hundred thousand boxes all told, but a small quanty of which is available after the Florida crop begins moving.

We wish to state that we are not foreigners. We are American tizens. Over 90 per cent of the entire Isle of Pines is owned by mericans. I do not know of a single native on the island who is gaged in fruit growing.

Our investments up to the present will reach at least $2,000,000.

We have established American churches and schools and employ merican teachers and support them entirely with our own money.

We have established an American bank, and American money rculates there just as it does in the States, also an American newsaper. An American-owned steamship line operates between the le of Pines and the island of Cuba. Also a small line operates irect between Tampa and the island. At our own expense we have

built bridges over the small rivers and streams, and have constructed good roads leading into every section of the island. We have taken in the automobile, auto truck, and tractor. In short, we found the Isle of Pines a wilderness, so to speak, and the Americans have made it a progressive, up-to-date American community.

The strategic importance of this American-settled island in relation to the Panama Canal is fully understood.

In area the Isle of Pines is about two-thirds the size of the State of Rhode Island. On the west side of the island there is a bay about 15 miles long and 10 miles wide, into which ocean-going steamers can enter.

The members of your committee, of course, know the history of the Isle of Pines, how Americans became interested and made investments there.

The constitution of Cuba was made under the provisions of the Platt amendment. And the sixth article of the amendment reads: "The Isle of Pines shall be omitted from the constitutional boundaries of Cuba, the title thereto being left to future adjustment by treaty." No treaty as yet has been voted upon.

The Paris treaty reads "Spain cedes to the United States, Porto Rica and the other islands in the West Indies, excepting Cuba."

Gen. Pershing, in a communication addressed to Mr. George Bridges, Carlisle, Pa., dated War Department, Washington, D. C. August 14, 1899, stated:

SIR: Referring to your communication of the 10th instant soliciting information respecting the Isle of Pines, I am directed by the Assistant Secretary of War to advise you that this island was ceded by Spain to the United States and is therefore part of our territory, although it is attached at present to the Division of Cuba for Governmental purposes.

JOHN J. PERSHING,
Assistant Adjutant-General.

Secretary of War Root, in a message to Gen. Wood, dated Washington, May 16, 1902, used these words:

It is understood by the United States that the present Government of the Isle of Pines will continue as a de facto Government, pending the settlement of the title of said island by treaty pursuant to the Cuban constitution and the act of Congress of the United States, approved March 2, 1901.

In view of these facts, which explain the actual status of the island territory, we feel that we are justified in asking your committee to recommend the elimination from the present bill of the proposed increased duty on grapefruit.

(The witness submitted the following letters:)

NEW YORK, *August 25, 19..*

Mr. J. D. POTTS, *New York City.*

DEAR SIR: Your letter of the 22d instant duly received.

In reply would state that we can see no reason why there should be a duty placed on grapefruit. The bulk of the grapefruit grown in the Isle of Pines and Cuba comes into the market before the Florida fruit is ripe, the remainder being held on the trees until spring, when the Florida fruit is out of the way; therefore there is no competition with the Florida product.

Further, the quantity of grapefruit grown outside is infinitesimal as compared with the millions of boxes grown in Florida.

We handle our share of the Isle of Pines grapefruit every season, also we handle the Florida grapefruit, therefore in our opinion there is no interest served in placing a duty on grapefruit.

Yours, very truly,

FREDERICK OPOLINSKI

NEW YORK, *August 27, 1921.*

J. D. POTTS, *New York City.*

)EAR SIR: Replying to your letter of the 22d instant, beg to advise you that we idle every season a considerable quantity of grapefruit grown both in the Isle of ies and Florida.

nasmuch as the Isle of Pines fruit begins arriving in the market about six weeks to months ahead of the Florida product, their interests as a consequence do not con-t. Besides, the Isle of Pines practically stops shipping after the Florida fruit ins to come to the markets.

'herefore a tariff levy is not needed for the protection of grapefruit grown in the tes.

Yours, very truly,

THE CURRAN, ROBERTSON CO. (INC.).

NEW YORK, *August 8, 1921.*

OLIVES.

[Paragraph 744.]

STATEMENT OF H. C. NEWCOMB, REPRESENTING THE SPANIS GREEN OLIVE IMPORTERS' ASSOCIATION.

Mr. NEWCOMB. Mr. Chairman and gentlemen, in submitting brief statement for the Spanish Green Olive Importers' Associatio with reference to paragraph 744, olives, attention is called to t fact that most of the members are packers and importers of su olives, to whom those olives are raw material imported in bulk be bottled and put into small packages for consumers. The indust has been long established in the United States.

For further data as to the importance of the industry in conjun tion with allied industries supplying materials which go to make the finished product, we refer to the briefs filed with the Committ on Ways and Means of the House of Representatives, published pages 1616 to 1618 of the hearings on tariff revision, and also to t brief which we file with your committee.

In equity, in the amount of revenue received, and in the questi of protection, this association claims that the rates of duty on Spani green olives should not exceed on green olives in brine 15 cents gallon.

We submit that a greater amount of revenue would accrue to t Government if the rate of duty were kept at 15 cents per gallo There is no American industry able to furnish either of the variet of green olives we import, hence none to protect. No ripe olives imported from Spain.

We claim that the proposed protection to the California ripe-ol industry is unfair to our American industry and to consumers.

Under the proposed duty of 20 cents per gallon on plain olives t ad valorem equivalent is 42¾ per cent of the value of the gre Spanish olives, as an average, for the last 10 years. To this shou be added an advantage which the California packers of ripe-ol have on the finished product in the difference between eastbound a westbound freight rates in carloads of 40,000 pounds, between t Pacific coast and New York, and vice versa, making a total advanta of about 68 per cent in duty and freight rate advantages.

This comes from the fact that if the California people send to Ne York a carload of 40,000 pounds of finished product it costs $1. more to send them from California to New York than it does to se the same car back. That is, per hundred pounds.

Senator CURTIS. Let us say, for instance, that there is no duty. you imported your olives, where could you meet them on freight :es?

Mr. NEWCOMB. The difference amounts to 6.5 cents per gallon. e present duty has existed for about 25 years. It has been 15 its per gallon. We are perfectly satisfied with that. We have :n able to meet competition. We do not claim that it should be ced on the free list. We are perfectly willing to pay what has :n paid, but when they attempt to raise it, to make this increase, think it is unfair. We do not want to evade the payment of a :y.

Senator CALDER. The present duty is 15 cents a gallon?

Mr. NEWCOMB. Under the emergency tariff bill it is 25 cents. For ny years it was 15 cents.

The California ripe-olive packers do not need such high protection. ey neither need nor deserve it. The Spanish and the California es are distinct. California does not produce green olives; Spain s not produce ripe olives for import into the United States.

The Spanish green-olive industry, as conducted by the American kers, both needs and merits protection against the excessive claims California producers and packers.

Taking the importations in seven months, from February to August, usive, in 1920, as an illustration, when the importations amounted 3,094,704 gallons, according to trade statistics, and comparing m with the corresponding seven months in 1921, when the impor-ons amounted to about 1,841,000 gallons, according to the same le statistics, the falling off in importations amounted to about 61 cent.

There must be a greater reason for such a decline than the general ression in all lines of business at this time. It is to be found in the gedies from ripe California olives during the last two years, the st being a case in Greensburg, Pa., in June last, when three persons their lives. The wide publicity given to the various cases ughout the country is said to have destroyed confidence in Cali-ia ripe olives as a safe food product, and according to the trade nal of that industry has cost a loss of 90 per cent of their trade. The publicity given did not make plain that Spanish green olives not—by reason of the different method used in preserving them—e poisoning of any kind, there has grown up a fear among con-ers of olives as to the safety of all olives, and we are led to the f that of the 61 per cent reduction in the importation of Spanish n olives during the last seven months at least 30 per cent of that ine is to be attributed to the general fear of olives as a food.

Senator CURTIS. How do you know that there was a falling off of er cent?

Mr. NEWCOMB. I was told so by the secretary of the California e Association.

Senator CURTIS. Do you claim that was because of the increased r on the merchandise?

Mr. NEWCOMB. We claim that 30 per cent of that falling off was to these poison cases.

Senator CURTIS. Then how do you account for the small importa- in 1919?

Mr. NEWCOMB. Because there was no demand for them; we could not sell them.

Senator CURTIS. Why couldn't the same argument be made at th time?

Mr. NEWCOMB. I do not get the question.

Senator CURTIS. Would not the same argument apply at this time that is, that this reduction in importation might be brought about b the fact that there was no demand at this time?

Mr. NEWCOMB. We can make a demand once we can make the con sumer understand that this is a safe olive. That is the problem. T do that we shall have to advertise nationally.

Senator McLEAN. Did I understand you to say there is no marke for the green olive?

Mr. NEWCOMB. The business has fallen off 90 per cent.

Senator McLEAN. On the green olive?

Mr. NEWCOMB. No, sir; the ripe olive.

Senator McLEAN. Of course, they are green some time.

Mr. NEWCOMB. They do not pick them at that time.

Senator McLEAN. Why is not the California olive marketable i the green stage?

Mr. NEWCOMB. It has not the size of the Spanish olive. E perience has taught that it is impossible to cure and keep them.

Because of this falling off, from no fault of the green olives, a the double advantage to the California packers and producers in t inequitable freight rates and the proposed duty of 20 cents p gallon, we claim that protection is merited by the American pack of Spanish green olives rather than a protection to the Californ interests.

In considering the amount of revenue probable from future i portations of Spanish green olives, the falling off of 61 per cent importations during seven months of this year seems to be signi cant.

That difference, taking the imports for the seven months of 1 at the duty rate of 15 cents per gallon then existing and for the se months of this year at the proposed rate of 20 cents per gall amounts to nearly $100,000, as shown by the figures submitted.

A tabulation is also presented herewith, as referring to the fr advantage, compiled from recent rates obtained from the Inters Commerce Commission.

By fixing the rate of duty where it has been for many years un the approval of your committee at 15 cents per gallon, we believe t customs officials may conservatively estimate an income of clos $1,000,000 per year from Spanish olive importations, once norm times are restored, as against the average income for the last 10 ye of $500,000.

BRIEF OF H. C. NEWCOMB, REPRESENTING THE SPANISH GREEN OLIVE IMPORTERS' ASSOCIATION.

In submitting this brief, attention is called to the fact that most of the me are packers and importers of such olives, to whom those olives are raw materia ported in bulk to be bottled and put into small packages for consumers. The try has been long established in the United States.

For further data as to the importance of the industry in conjunction wit industries supplying materials which go to make up the finished product, we re the briefs filed with the Committee on Ways and Means of the House of Repres tives, published on pages 1616 to 1618 of "Hearings on Tariff Revision," and a the brief filed with your committee.

ı equity, in the amount of revenue received, and in the question of protection, association claims that the rates of duty on Spanish green olives should not exceed ents per gallon. We submit that a greater amount of revenue would accrue to Government if the rate of duty were kept at 15 cents per gallon. There is no rican industry able to furnish either of the varieties of green olives, hence none rotect. No ripe olives are imported from Spain.

e claim that the proposed protection to the California ripe-olive industry is unfair ır American industry and to consumers.

nder the proposed duty of 20 cents per gallon on plain olives, the ad valorem valent is 42¾ per cent of the value of the green Spanish olives as an average for ast 10 years. To this should be added an advantage which the California packers pe olives have on the finished product in the difference between eastbound and bound freight rates in carloads of 40,000 pounds between the Pacific coast and York, and vice versa, making a total advantage of about 68 per cent in duty freight advantages.

portations of Spanish green olives, February to August, inclusive, 1920 and 1921.

[Compiled from trade statistics.]

	Gallons.
ortations in 1920:	
13,263 casks of 160 gallons	2,122,080
20,263 barrels of 48 gallons	972,624
	3,094,704
rtations in 1921:	
About 8,500 casks of 160 gallons	1,360,000
About 8,500 barrels of 48 gallons	480,000
	1,840,000

nce, a falling off in importations during the seven months indicated of 61 per from 1920.

e California ripe-olive packers do not need such a high protection. They neither nor deserve it. The Spanish and the California olives are distinct. California not produce green olives; Spain does not produce ripe olives for import into nited States.

e Spanish green-olive industry as conducted by the American packort both and merits protection against the excessive claims of California producers and rs.

ing the importations in seven months from February to August, inclusive, in s an illustration, when the importations amounted to 3,094,704 gallons according le statistics, and comparing them with the corresponding seven months in 1921, the importations amounted to about 1,841,000 gallons according to the same statistics, the falling off in importations amounted to about 61 per cent.

re must be a greater reason for such a decline than the general depression in all of business at this time. It is to be found in the tragedies from ripe California during the last two years, the latest being a case in Greensburg, Pa., in June when three persons lost their lives. The wide publicity given to the various throughout the country is said to have destroyed confidence in California ripe as a safe food product, and, according to the trade journal of that industry, has loss of 90 per cent of their trade. As the publicity given did not make plain Spanish green olives can not (by reason of the different method used in preg them) cause poisoning of any kind, there has grown up a fear among consumers es as to the safety of all olives, and we are led to the belief that of the 61 per nt reduction in the importation of Spanish green olives during the last seven s at least 30 per cent of that decline is to be attributed to the general fear of olives od. Because of this falling off from no fault of the green olives, and the double tage to the California packers and producers in the inequitable freight rates e proposed duty of 20 cents per gallon, we claim that protection is merited by nerican packers of Spanish green olives rather than a protection to the California interests.

onsidering the amount of revenue probable from future importations of Spanish olives, the falling off of 61 per cent during seven months of this year seems to nificant.

: difference, taking the imports for the seven months of 1920 at the duty rate ents per gallon then existing, and for the seven months of this year at the prorate of 20 cents per gallon, amounts to nearly $100,000, as shown by the accomg tabulation.

Tabulation is also presented herewith as referring to the freight advant[illegible] piled from recent rates obtained from the Interstate Commerce Commission.

By fixing the rate of duty where it has been for many years under the [illegible] your committee, at 15 cents per gallon, we believe the customs officials [illegible] servatively estimate an income of close to $1,000,000 per year from Span[illegible] importations, once normal times are restored, as against the average incom[illegible] last 10 years of $500,000.

The Spanish Green Olive Association most respectfully presents th[illegible] and figures for your wise consideration.

California olive packers' advantages over American packers of Spanish green [illegible] present freight rates, as confirmed by the Interstate Commerce Commission [illegible] 1921, on finished products; and in the proposed rate of duty on Spanish gr[illegible] of 20 cents per gallon.

[All-rail and Gulf routes, per 100 pounds. In 100 pounds there are net 18.18 gallons [illegible]

	Eastbound, in cars of—		Westbound, in cars of—		Difference, in favor of California, in cars of—		Advantage to [illegible] per gal. By freight.		B[illegible]
	40,000 pounds.	80,000 pounds.	40,000 pounds.	60,000 pounds.	40,000 pounds.	60,000 pounds.	40,000 pounds.	60,000 pounds.	40,000 pounds.
							Cents.	Cents.	[illegible]
San Francisco to New York	$1.42	$1.20½							
New York to San Francisco			$2.58¾	$1.83½	$1.16¼	$0.63	6.41	3.46	3.[illegible]
Plus 45½ per cent for gross gallons, at 10 pounds, instead of net gallons at 5½ pounds							5.24	2.83	[illegible]
							11.65	6.29	

The net figures are calculated upon the standard of 5½ pounds of olives to the gallon, as taxed [illegible] officials; but in shipping 10 pounds are counted as a gross gallon, taking in the brine and pa[illegible] it is necessary to increase the "Advantages to California packers" in freight by 45 per cent [illegible] the real benefit accruing to the disadvantage of Spanish green-olive packers.

Ad valorem equivalents.

[For the last 10 years the average value of Spanish green olives has been 46.77 cents per gallon [illegible] average rates of exchange. The proposed duty of 20 cents per gallon is equivalent to 42.76 [illegible] the value of the olives per gallon.]

	California's advantages in freights, in cars of—		California's [illegible] vantages [illegible] and in the [illegible] duty, in ca[illegible]	
	40,000 pounds.	60,000 pounds.	40,000 pounds.	[illegible]
	Per cent.	Per cent.	Per cent.	P[illegible]
At the net gallon advantage of 6.41 cents	13.70		58.[illegible]	
Plus the gross gallon advantage, including brine and package	11.20		11.[illegible]	
	24.90		67.[illegible]	
At the net gallon advantage of 3.46 cents		7.40		
Plus the gross gallon advantage, including brine and package		6.05		
		13.45		

A high rate ad valorem on finished food products is 40 per cent But Spanish green olive[illegible] are a raw material to the American packers, and in reason they should be taxed at less than [illegible] ad valorem.

PINEAPPLES.

[Paragraph 746.]

STATEMENT OF VICTOR ELTING, REPRESENTING THE WEST INDIES FRUIT IMPORTING CO., CHICAGO, ILL.

Mr. ELTING. I shall make a brief statement with regard to the prosed duty on fresh pineapples, as provided in paragraph 746.

We have no concern in the latter part of that provision, which has do with canned pineapples, and no concern in the first part, so far it refers to the tax upon pineapples in bulk.

I am counsel for the West Indies Fruit Importing Co., which is a icago corporation representing an investment of something over 000,000, and the stock of which is held entirely in Michigan, Wisısin, and Illinois.

It distributes and sells the majority of fresh pineapples that are ısumed by the public in the United States.

I have also been asked by a dozen or more of manufacturers of tes—pineapple crates—to appear and file their names with the nmittee as indorsing the suggestions which I should like to make.

What we want is a change in the method of imposing this tariff and eduction in the amount of the tariff to not more than the present y under the Underwood bill.

First, as to the method——

Senator McCUMBER. What is the provision of the Underwood bill?

Mr. ELTING. It is on a different basis, and provides for 6 cents per ic foot of the capacity of the barrels or crates; and in bulk for per thousand.

The proposed provision, which I assume you have before you, is much per individual piece of fruit.

Now, as to the method, the three-quarters of a cent on each piece ruit. That is a novelty in the history of the imposition of duties n pineapples. No such method was provided in any previous ff bill. It seems to me that it is obviously an error, and is based n misunderstanding or failure to understand the pineapple trade.

n the sale and distribution to jobbers and dealers of pineapples in East, the crate is the unit, both in the importation from Cuba and sale of Porto Rican and Florida pineapples. The crate is of a ıdard, uniform size, used universally in the entire trade. The ıapples contained in the crate are themselves uniform in size, so ıs each crate is concerned, that is, the larger sizes—what are known 18s—come in crates of standard size, containing 18 pineapples. n in 24s there are 24 pineapples; and so it goes up to 36s and 48s. y are known in the trade as 18s, 24s, 36s, and 48s. As I say, in ven crate each one is of the same size.

he tariff of so much per pineapple increases the tariff inversely to value of the contents, and a crate of 48s would pay twice as much y as a crate of 24s. In the market, however, a crate of 24s is th 30, 40, and even 50 per cent more than a crate of 48s, in spite he fact that it contains only half as many pieces of fruit.

Senator DILLINGHAM. Why is that?

Mr. ELTING. Because the public likes the larger sizes. You untand that this fruit about which I am speaking is distributed ıughout the entire United States.

Senator CURTIS. And the crates are of the same size but the pi apples are smaller—that is the point?

Mr. ELTING. Yes; that is the point. They are not only of su stantially the same size, but they are absolutely of the same siz The 18s are separated and put in crates, and the 24s are treated i the same manner.

This fruit of which I am speaking is distributed and sold throug out the United States as a highly perishable fresh table fruit. It consumed by the householders and, of course, to a certain extent restaurants, and to a very large extent canned by housewives for u in the family as desert out of season.

Senator CURTIS. There is a pretty steady trade. I notice t importations have run about the same for the last two years.

Mr. ELTING. The crop matures in April, May, and June of ea year. While the public absorbs the entire offering of pineapples, the greater bulk, or the larger percentage, of the crop, in fact alm the entire crop, is consumed and distributed during the months April, May, and June.

There are about 1,200,000 crates of fresh pineapples distribut and sold in the United States in a year, and of those over 1,000 come from Cuba.

The Florida output for the past year was about 40,500 crates the Porto Rican output about 160,000 crates; so that of the 1,200, over 1,000,000 come from the island of Cuba. These three distri produce the only fresh pineapples that are sold in the United Sta

Senator CURTIS. We do not get any from the West Indies Isla and Central and South America?

Mr. ELTING. No. The Hawaiian crop, on account of distance, to be canned and is sold as canned fruit. That comes under a spe provision with which we are not concerned.

I should say also, in passing, that this proposed tariff law does distinguish between pineapples in barrels and pineapples in bulk

Senator McLEAN. Just what do you want?

Mr. ELTING. We want the method changed to the old method we want the rate reduced to not more than the old rate.

Senator DILLINGHAM. Have you written your proposal?

Mr. ELTING. I have, but if I may I should like to present facts which affect this country. One other suggestion and I be through.

The Cuban crop of pineapples paid the steamship companies transport the pineapples from Cuba—you understand they a American-owned steamship companies, including the car ferry w comes to Key West, and which is owned by the Florida East C Co.—$323,200 in transportation charges during the season of 19

The American railroads that hauled the crop were paid $86 You will understand that each individual piece of pineapple is wra in paper and packed in the crates. Paper, crates, and nails are chased from American factories. The amount paid for crates $467,000; paper, $115,000; and for nails, $30,000.

This crop, being distributed all over the United States, is greater or less extent, a part of the business of jobbers and dea throughout the entire country; and, of course, the public is concer because, as I say, the consumption is household consumption.

Reverting for a moment to this method of so much per pineapple, should have said that this would involve an excessive cost in adinistration, as pineapples come in during the busy season in large ulk, sometimes running as high as 25,000 to 30,000 crates per day, Key West. This would involve tabulation of the individual pieces of neapples brought in. I do not mean counting each crate. Under ie present system, all that is necessary is to count the number of ates. Taking the time to count these 25,000 or 30,000 crates under ie new method would make a great deal of difference. This is a ghly perishable fruit, which must be rushed. It is but a question a few days and it decays in transit. This tabulation at the point entry would involve a delay at least of another day, which is a ghly important factor to consider.

Very briefly, the history of the tariff is that pineapples were free in 90. There was a 20 per cent ad valorem rate in 1894. In 1897 e present method which is now in force was adopted, the rate being cents per cubic foot. In 1909 that was raised to 8 cents per cubic ot, which amounted to about 20 cents per crate on the size of the en crate, which was larger. The Underwood bill provides for 6 nts per cubic foot, which applied to the present size crate, someiat smaller, makes the tariff at present 11.76 cents per crate.

The proposed tariff of three-quarters of a cent on each pineapple read over the 1921 season and averaged on all sizes, would make an erage duty of 25.6 cents per crate, as opposed to 11.76 cents, which w obtains.

I wish to impress upon the committee that there is no real American lustry to protect in this matter. In 1909, when this tariff was ised, Florida was making a very strenuous effort to engage in the ieapple industry, and for the next few years produced a large iount of pineapples. It was done through intensive cultivation the soil, which was not naturally adapted to the production of ieapples. Production then began to fall off. In 1910 it was less in one-half, and then, with certain temporary rises, it has since adily gone down until it dwindled last year to only 70,500 crates. is year, as I have said, it dropped to 40,500 crates.

Senator CURTIS. Could you give us the average number per crate?

Mr. ELTING. Per crate?

Senator CURTIS. Yes; the average number.

Mr. ELTING. Thirty pineapples.

Porto Rico has had much the same history. At one time they iduced as much as half a million of crates of pineapples. That has indled to about 160,000 in the present year. That is due, as in case of Florida, to the fact that the soil is not adapted to their iduction. They are likely to have killing frosts. On the east st of Florida frosts have in times past killed in certain sections the ire crop.

n Porto Rico, so far as I am advised—I can not speak with hority on that—the soil is not adapted to it. Labor conditions, an freight, and everything else in Porto Rico is practically the same n Cuba. The outstanding fact is that the growth of fresh pineiles has dwindled.

The business on the present basis this year has been unprofitable the Cuban growers. I say this bearing on the question as to ether this industry will stand an increase in tariff. The cost of the

pineapples laid down on the dock in Habana, under the most fav- able circumstances, is little less than the prices which we have be able to get for them. That is due to the fact that they have to p- more for crates, paper, etc., in the United States, owing to the co- ditions here, and to the fact that railroad freights have gone up ve- largely—I think about 40 per cent—in the last four years, and lab- over there has gone up.

This year was a very disastrous year to certain growers. Othe- came out even, and a few made a profit.

This proposed tariff would involve a very substantial increase a- would be discouraging rather than encouraging to an industry whi- affects the United States in a business way, as I have indicated. an- also affects the household consumption. I will say that there business enough for all, for Florida, Porto Rico, and Cuba. T- public absorbs what is offered. The prices have gone down about per cent this year over last year; that is, what the public has to pa-

May I have the privilege of filing a brief?

Senator McCUMBER. You may file a brief, and it will be printed a part of your remarks.

BRIEF OF VICTOR ELTING, REPRESENTING THE WEST INDIES FRUIT IMPORTI- CO., CHICAGO, ILL.

The West Indies Fruit Importing Co., of Chicago, Ill., importer of Cuban p- apples, on behalf of its stockholders, its customers, and the consumers of fr- pineapples throughout the United States, and American manufacturers of supp- connected with such industry, presents the following statement with regard to proposed tariff:

PROPOSED DUTY.

Paragraph 746 of H. R. 7456 is as follows: "Pineapples, three-fourths of 1 cen- pineapples, prepared or preserved in any manner, 20 per centum ad valorem."

RECOMMENDATION.

We recommend that this provision as to fresh pineapples be eliminated, and that fresh pineapples be placed upon the free list or that a duty of not more tha- imposed by the Underwood tariff bill be imposed, to be assessed according method provided for in that bill.

The provisions of the Underwood bill are as follows: "222. Pineapples, in barr- other packages, 6 cents per cubic foot of the capacity of the barrels or package bulk, $5 per thousand."

GENERAL STATEMENT.

There were distributed and sold in the United States during the season of approximately 1,200,000 crates of fresh pineapples, of which more than 1,00- crates were grown and shipped from the island of Cuba. The annual pineappl- matures in April, May, and June of each year, and is shipped and sold imme- after picking as a highly perishable fruit. Only small quantities mature in seasons of the year, and it is for this reason that the figures for the year 1921 ar- available. The fruit is distributed and sold by commission merchants to jobber- dealers throughout the entire country and is absorbed by the general public d- the season when no other fresh home-grown fruits are available in quantity, w- exception of strawberries. A considerable portion of the product is taken by h- and restaurants, but the bulk of the product is used in small quantities by Am- families either as a table fruit for desserts and salads or by canning by housew- later consumption.

REASONS FOR RECOMMENDATION OF CHANGE IN PROPOSED TARIFF RATE

In support of our recommendation we submit the following facts:

I. The proposed method of computing the tax is obviously erroneous and ill-

(a) *The method of imposing the tax is illogical.*—The method provided Fordney bill for fixing the amount of the tax, namely, by imposing a tax

urths of 1 cent upon each pineapple, is obviously wrong, and must have been drafted ider a misapprehension as to the conditions surrounding the pineapple trade. If is method were adopted, the tax upon each crate of pineapples would increase as value of the contents of the crate diminished. This will be plain from the folving illustration: Pineapples are packed and shipped in crates of a single standard e, containing pineapples of uniform size; but the sizes of the pineapples in different ites differ widely, so that a standard crate may contain from 12 to 48 separate pieces fruit. These are referred to in the trade as 12s, 18s, 36s, and so on. The fruit is irketed and sold by the crate; that is, the crate is the unit in marketing; but as larger sizes are very much more in demand than the smaller sizes, the crates conning 18 and 24 pieces are worth very much more on the market than those conning 36 or 48 pieces. In fact, a crate containing 24s brings usually 40 or 50 per cent re than a crate of the same size containing 48 pieces. If the Fordney provision uld be maintained, the tax upon a crate of 48s would be exactly twice the tax upon rate of 24s.

b) *The administration of the proposed tax would involve excessive cost.*—The placing a tax on the individual pineapple, rather than upon the crate, is obviously illised, for the reason that the administrative cost would be out of all proportion he revenue secured. It would necessitate the counting, or at least the tabulating, he number of pineapples in each crate instead of the mere counting of the number rates. During the height of the season as many as 30,000 crates are received in day, and it is plain that the inspection and tabulation of such a quantity would olve a great time and expense.

c) *The proposed method would likewise involve a loss to the importers and consumers.*—ieapples are a highly perishable fruit, and must be consumed within a few days r picking. As it is, the loss from decay in transit is very substantial. The proed method, which would require the counting or tabulation of the individual ces, would necessarily involve delay during the height of the season, when such ay would be more or less disastrous to the product.

Ve therefore submit that in any event the method of imposing the tax should be nged.

I. The amount of the proposed tax excessive.

a) *History of duty on fresh pineapples.*—Tariff act of 1890, pineapples free. Tariff of 1894, a tax of 20 per cent ad valorem. Tariff act of 1897, pineapples in barrels ther packages 7 cents per cubic foot capacity of the barrels or packages; in bulk, per thousand. Tariff act of 1909, section 279, pineapples in barrels and other kages 8 cents per cubic foot of the capacity of the barrels or packages; in bulk, per thousand. (The standard crate at the time of the foregoing contained about ubic feet, so that, at 8 cents per cubic foot, the tax amounted to 20 cents per crate.) iff act of 1913, section 222, pineapples in barrels or other packages, 6 cents per ic foot of the capacity of the barrels or packages; in bulk $5 per thousand. (At present time the standard crate is smaller in size and contains 1.96 cubic feet, so the tax of 6 cents per cubic foot amounts to $0.1176 per crate.)

he proposed duty of the Fordney bill of three-fourths of 1 cent upon each pineapple ld mean upon the average basis of the season of 1921, in view of the sizes shipped ing that season, an average of $0.256 per crate.

) *Description of pineapple industry.*—The fresh pineapples sold at the present in the United States are grown for the most part in the island of Cuba, comtively small quantities being grown in Porto Rico and Florida. The following statement of the quantities grown in the three places, as derived from railroad steamship records:

	Cuba.	Florida.	Porto Rico.
..	918,944	70,500	145,000
..	1,010,000	40,500	160,000

ome years ago the State of Florida undertook the raising of pineapples upon a large and attempted to overcome the natural disadvantages of soil by fertilizing. eedings before the Committee on Ways and Means, Sixty-second Congress, third on, 1913 (Vol. III, p. 3149), shows that in the year 1909 Florida produced more 1,000,000 standard crates. Immediately thereafter the production fell to 450,000 and from that time on, after a temporary slight increase, production has rapidly ased, until during the season of 1920 the total production was 70,500 crates, and shipments in 1921 were 40,500 crates, an insignificant amount. This record is in

the face of the fact that as a part of the United States the products of Florida are exempt from the duty imposed upon the Cuban pineapple. It can be fairly said, therefore, that Florida is not a real factor in the pineapple industry. According to our information, this result is due to natural causes. In the first place, the soil is not adapted to the growing of pineapples and can only be made so for the time being through intensive fertilization, the benefits of which quickly disappear. An equally serious disqualification is that of the climate. The east coast of Florida, where growing was attempted, is subject to sudden killing frosts, which on occasion destroyed entire crops of pineapples in certain localities. We are advised that these are the principal causes for the practical abandonment of the industry, other causes being matters of labor, transportation, etc.

The island of Porto Rico also produces a comparatively small quantity of pineapples and this quantity has increased but little during the many years in which pines have been attempted to be grown in that island. We are informed that labor, ocean freight, and other conditions are the same as those surrounding the Cuban pineapple trade, but that the soil of Porto Rico is not adapted to the growing of the fruit. We are also informed that the quantity of land available for this purpose in Porto Rico is more limited than in Cuba. Whatever the foregoing facts may be, the outstanding fact is that during all of the past years the quantity of pineapples grown in Porto Rico has not substantially increased and is now a negligible factor, notwithstanding the fact that as a possession of the United States its products have been free from duty, under the protection of the Underwood tariff.

In Cuba the growing of pineapples is an important industry in which large numbers of persons are employed. It has steadily increased during the past years, and its product is readily absorbed by the people of the United States. It can not be said to be in competition with Porto Rico and Florida, as the total supply of pineapples from all sources does not meet the normal demand in the United States.

The Cuban growers purchase all of their crates, paper, and nails required in the packing of the fruit from American manufacturers, and ship all of the product on steamers owned by the United States or upon the car ferry of an American railroad.

(*c*) *Proposed tariff exorbitant and injurious to United States interests.*—During the season of 1921 the growers of pineapples in Cuba made no profit from their pineapples and in many instances suffered heavy losses. This was due to the fact that practically all their costs and expenses have greatly increased. The prices of crates, paper, and nails are substantially higher, owing to conditions in the United States; railroad freight rates have largely increased, the increase being approximately 40 per cent during the last four years; and labor and other items in Cuba are likewise substantially higher. Inasmuch as the fruit is shipped by the Cuban growers to the United States for sale by commission houses, as their agents, they receive only what the fruit brings upon the market in the United States, and the actual proceeds of sale in 1921 were insufficient to meet their costs. This condition is likely to continue until these costs are reduced through economic causes.

The increase in duty proposed by the Fordney bill, if applied to the season of 1921, would show an average of $0.256 per crate, as against $0.1176 of the old rate, being an average increase of $0.1384, or 117¾ per cent. This will be shown by the following statement:

Under the present Underwood tariff law the duty is $0.1176 per crate, and upon the crop of 1921, consisting of 1,100,000 crates, the duty was $118,776. Under the proposed rate of the Fordney bill a duty upon the crop of 1921 would have required the payment of the following tax:

Size 12, 83 crates, at three-fourths cent per pineapple, or $0.09 per crate..
Size 14, 42 crates, at three-fourths cent per pineapple, or $0.105 per crate.
Size 16, 942 crates, at three-fourths cent per pineapple, or $0.12 per crate.
Size 18, 13,981 crates, at three-fourths cent per pineapple, or $0.135 per crate..
Size 24, 139,139 crates, at three-fourths cent per pineapple, or $0.18 per crate..
Size 30, 271,462 crates, at three-fourths cent per pineapple, or $0.225 per crate..
Size 36, 350,271 crates, at three-fourths cent per pineapple, or $0.27 per crate..
Size 42, 188,563 crates, at three-fourths cent per pineapple, $0.315 per crate..
Size 48, 45,517 crates, at three-fourths cent per pineapple, or $0.36 per crate..

The increase shown by the above figures added to the loss sustained by the growers uring the season of 1921 would have been disastrous to some of these growers and ijurious and discouraging to all.

Any action by Congress in the proposed tariff bill resulting in injury and discourage-ent to the industry would likewise seriously affect the interests of the United States the following ways:

All of the Cuban pineapples were transported to this country by car ferry or by merican-owned steamships. Freight charges paid to American steamship companies nd ferries during the season of 1921 were approximately $323,000.

The amount of freight paid the railroads of the United States for handling the Cuban op during the season of 1921 was $868,600.

All of the crates, paper, and nails used in 1921 were purchased of manufacturers of e United States. The payments were as follows: For crates, $467,000; for paper, 15,000; for nails, $30,000.

Inasmuch as the pineapples are distributed throughout the United States, they are portant to the business of a large number of business houses throughout the entire untry, and certain concerns such as the West Indies Fruit Importing Co. are engaged clusively in the pineapple business. A large amount of capital is involved in its erations, inasmuch as advances are made to the Cuban growers to finance them for raising of their crops. The West Indies Fruit Importing Co. has a preferred pital stock of $750,000 which has been sold to the public, principally in the States the Middle West; and the company now has approximately 3,000 stockholders.

THE CONSUMING PUBLIC.

The present supply of fresh pineapples is insufficient to meet the demand, and any ion substantially reducing the quantity of the product would deprive the American ople to the extent of such reduction of this popular fruit.

In conclusion, we submit that the proposed provision be changed as to the method fixing the tax, so that the amount of the tax will not increase inversely to the value the product.

That the tax be fixed at an amount which will encourage and not discourage the lustry, so that American business and the American public will reap the benefit. ere is no occasion for a protective tariff on pineapples, inasmuch as there is no real erican industry to protect.

ATEMENT OF GEORGE McK. McCLELLAN, REPRESENTING THE HAWAIIAN PINEAPPLE PACKERS' ASSOCIATION.

Mr. McClellan. Mr. Chairman, I represent the Hawaiian Pine-ple Packers' Association. I desire to speak in connection with question which has been raised this morning of the adjustment the rate on fresh pineapples.

I am sure that the representative of the West Indies Fruit Im-rting Co. would not intentionally mislead the committee; but, as matter of fact, I understood him to state that there had never fore been a rate per thousand assessed in the tariff laws. I call attention of the committee to paragraph 279——

Senator McCumber. The rate per thousand?

Mr. McClellan. I understood his statement to be that the had always been on a per cubic-foot basis and that there had no rate per piece or per thousand.

Senator McCumber. Yes; I think he mentioned per piece

Mr. McClellan. As a matter of fact, reference to the tariff of 1909, paragraph 279, shows the following schedule:

> Pineapples in barrels or other packages, 8 cents per cubic foot of the capa barrels or packages, and in bulk, $8 per thousand.

In other words eight-tenths cent per pineapple. So that statement was mistaken and unfounded in fact.

What the Hawaiian growers are interested in is solely to equ the tariff rate. We indorse the statement made here that should be a rate per cubic foot. That is a mere matter of venience in importing the goods and handling them; but there been in the pineapple tariff from the time that it was written a in the matter of fresh fruit in crates.

The statement made here, I think, is approximately correct—m by the representative of the importing company—that the aver crate contains 30 pines. Therefore your figures are on that ba Those figures show that the present import duty is approxima 12 cents per crate or four-tenths cent per pine. But, at the sa time, the bulk rate is five-tenths cent.

I take it that I do not need to argue to the committee that w you are importing fresh fruit you do not want to have a lower r on fresh fruit in crates than you have on it in bulk. If anythin should be a higher rate.

All that the Hawaiian pineapple growers are asking of you word, is that you should make a rate per cubic foot which w equal the rate per thousand—in other words, the rate in bulk it passed the House.

We can not very well conceive of any proposition that would sounder than that from a tariff standpoint, and we can not see a legitimate reason that could be brought to this committee, a do not understand that any was presented, why there should be lower rate on fruit in crates than there should be on the same f in bulk. That is the entire substance of the matter.

To show you the extent of the joker, in the 1909 law, I ha wade through that whole contention and knew that that wa over on the committee. The facts were misrepresented as t average number of pineapples per cubic foot. The committee told that the rate which was assessed in the 1909 tariff was equi lent to the bulk rate of $8 per thousand, which is eight-tenths As a matter of fact, it was practically five-tenths cent words, there was a differential of 60 per cent. The in in bulk came in at 60 per cent higher tariff ha in in crates.

I assume that I do not have to argue to th want to equalize this schedule.

Mr. Chairman and gentlemen, the represer company has spoken about the burden tha porters by the rate which has been assesse before you at the present time carries a ra

nt per fruit. Our contention is that not less than that should be sessed, because that is slightly below the tariff rate of 1909.

What we ask of you gentlemen is that you should make a rate per bic foot which would equalize the rate which is already written o the bill for bulk shipments, and that rate would be approxi- tely 11 cents per cubic foot, because a crate contains substantially ubic feet.

The testimony given showing that the average is 30 pines would ke the equivalent duty of the bulk rate 22½ cents per crate; that the equivalent duty on a crate, and as there are 2 cubic feet, the uivalent rate would be approximately 11 cents; to be exact, 11¼ its per cubic foot.

What I want to call to the attention of you gentlemen is this, that t increase or the putting in of the rate of 11 cents per cubic foot ild be an increase of only 10 cents per crate on the tariff; of this, e almost all of the importation comes from Cuba, only four-fifths ild be paid; in other words, the actual addition of the tariff to the ian import would be 8 cents per crate. Those crates sell on an rage at wholesale of $4.50 per crate, and I do not believe that committee can be persuaded that an additional cost of 8 cents ariff is going to be a burden on a crate of fruit which sells for i0 wholesale.

call the attention of the committee to the fact that this being a t which is in the nature of a semiluxury, not a standard staple of it can very reasonably stand a rate of tariff which shall be at t a reasonable revenue-producing rate. There is no reason why fresh fruit should come in here at a rate which is negligible and tariff from which they get a reduction of 20 per cent in addition. here is reason for this tariff correction being made, because at the ent time there are definite steps being taken to establish large 1-fruit plantations both in Haiti and Jamaica, and there is reason ink that a substantially large amount will come in. We are not mpting, so far as the Hawaiian growers are concerned, to shut n out. We are only suggesting that this rate, which is a very onable rate considering the product and considering its value, ld be equalized so that your rate per cubic foot should be estab- d at 11 cents, which would practically be the equivalent of 0 per thousand.

e ask that the pineapple schedule shall stand in the form in h it passed the House, with the addition of a rate of 11 cents cubic foot on fresh pineapples in crates or other containers.

TEMENT OF HON. WILLIAM A. RODENBERG, A REPRESENTA- VE IN CONGRESS FROM THE STATE OF ILLINOIS, AND HON. ROLD KNUTSON, A REPRESENTATIVE IN CONGRESS FROM E STATE OF MINNESOTA.

submit the following statement of facts with reference to paragraph 746, lule 7—Agricultural products and provisions. This paragraph reads as follows: neapples, three-fourths of 1 cent each; pineapples, prepared or preserved in anner, 3¾ cents per pound."

present duty on canned pineapples is 20 per cent ad valorem. This same of 20 per cent ad valorem was contained in the bill as reported to the House the Ways and Means Committee. Upon motion of Mr. Hawley, of Oregon, an dment was adopted by the House changing the duty of 20 per cent ad valorem cents per pound. This increase over the present tariff would amount to an se of more than 300 per cent in the duty. There is absolutely no justification

for this increase. Approximately 90 per cent of all the canned pineapples consum- in the United States are produced and canned in Hawaii. Fully 95 per cent of [illegible] labor employed in producing and canning these Hawaiian pines is coolie or Asia- labor, so that the argument can not be advanced that the increased duty would [illegible] in any way beneficial to American labor.

We further desire to call to your attention the fact that the Hawaiian Pineap- Co., which is one of the largest canners of pineapples in Hawaii and which was chie- responsible for this increase in the duty, has been making abnormal profits ev- under the present duty of 20 per cent. During the year 1920 the Hawaiian Pinea- Co. paid to its stockholders a stock dividend of 25 per cent, increasing their cap- from $1,600,000 to $2,000,000; and in addition to this stock dividend they pai- cash dividend in 1920 on the increased capital of $2,000,000 of 23 per cent. In ad- tion to these stock and cash dividends, the company also placed in its reserve [illegible] the net earnings of the year over $900,000. (See page 71, Manual of Hawaiian Se- ties, 1920, which has been handed to Senator Watson.) During the year 1921 [illegible] Hawaiian Pineapple Co. paid a 20 per cent cash dividend to its stockholders.

These figures conclusively prove that this industry is not entitled to this additi- duty, as it would operate to give the Hawaiian pineapple canners a complete mon- of the business. Instead of increasing the duty, it would be more advisable [illegible] equitable to reduce the original House provision of 20 per cent ad valorem.

We wish to state further that this unjustifiable amendment does not meet [illegible] the approval of all of the pineapple producers and canners in Hawaii, some of wh- are engaged in producing and canning other fruits and vegetables, and wh- [illegible] that the proposed increase will result in retaliatory legislation on the part of oth- exporting nations.

Pineapples are so generally used in American homes that legislation which w- have a tendency to increase the cost and create a monopoly in the industry w- [illegible] prove most unpopular with the great mass of consumers, who are certainly enti- to consideration at the hands of your committee.

HORTICULTURE.

[Paragraphs 751 and 752.]

STATEMENT OF JAMES McHUTCHISON, NEW YORK, N. Y.

Senator McCumber. Try to be as brief as possible, Mr. McHutchi- son.

Mr. McHutchison. Senator, we will try not to take more than [illegible] minutes of your time. We have put what we have to say in a ve- concise form. There are just the two of us present.

We represent the Society of American Florists and Ornamen- Horticulturists, which embraces in its membership practically all [illegible] the florists and horticulturists throughout the United States. We a- interested only in the horticultural schedule, which is covered [illegible] paragraphs 751 and 752.

First of all, we realize that the new tariff must produce much mo- revenue than the present one, but the House bill proposes duty rat- lower than necessary on some items, while on others they are so hig- as to prohibit importations; besides, the phraseology is loose an- indefinite and would result in loss of revenue. We want to coopera- with you in proportioning the duty rates properly on the differe- items. We do not ask for reductions except when the increa- exceeds 100 per cent of the present tariff. Our recommendatio- will increase rather than decrease the revenue but will not furth- unnecessarily depress business. We want only to regulate the rat-

Getting down to the paragraphs, in paragraph 751 the House b- proposes a duty on "tulip bulbs, $4 per 1,000." They are n- dutiable at 50 cents per 1,000.

The proposed raise of 800 per cent would prevent the importa- of all but high-priced varieties of tulips and would result in decrea-

venue. We recommend a duty of $1 to $2 per thousand bulbs, iich will be four times as much as the present duty but which will t materially decrease revenue. I am only mentioning items in it paragraph where we recommend changes which we think will of advantage to the Government as well as to ourselves.

On narcissus bulbs the House bill provides for a duty of $4 per ousand. They are now dutiable at $1 per thousand. As with ip bulbs, a 400 per cent raise would prevent the importation of cheaper varieties, thus reducing the total revenue on narcissus. recommend a duty of $2 per 1,000 bulbs.

On lily of the valley pips the rate in the proposed House bill is $4 thousand. These are now dutiable at $1 per thousand, and a e of 400 per cent would prevent the recovery of this line dislocated the war, thus reducing revenue. We recommend a duty of $2 thousand pips, which is double the present rate.

enator McLEAN. They are called clumps here.

Mr. McHUTCHISON. No; the clumps are $10 per thousand. That cceptable as it now stands. There is a very great difference be-en clumps and pips.

On lily bulbs the House bill provides for a duty of $4 per thousand, ugh they are dutiable now at $5 per thousand. While the pro-ed duty is agreeable, a raise to $5 or even $8 per thousand would reduce revenue or seriously reduce imports. We can stand rates s to increase the revenue, but under no circumstances should this 1 be made dutiable on an ad valorem basis, as it would be quite orkable. We recommend a duty of $6 per thousand bulbs on s.

he other items in paragraph 751, though showing a large increase uty rates, are acceptable as they now stand. That takes in the of the valley clumps and everything else in that paragraph.

aving in mind the necessity for increased revenue, yet wishing to ent a reduction in revenue as well as a further curtailment of im-ations and further disturbance of the business of American pro-ers, we recommend that the wording of paragraph 751 be changed ead as follows: There is a slight correction in verbiage and in the mas, which are very important in this technical business. ough the use of a comma and the taking out of an "s" in the last f there were thousands of dollars of revenue lost to the Govern-t. I have got the proposed paragraph punctuated very care-the way I think it should be written to prevent leakage. Shall d it over?

nator McCUMBER. Yes; if it is short.

r. McHUTCHISON (reading):

agraph 751: Tulip, and narcissus bulbs, and lily of the valley pips, $2 per 1,000. inth bulbs, $4 per 1,000. Lily of the valley clumps, $10 per 1,000. Crocus , $1 per 1,000. Lily bulbs, $6 per 1,000. Gladioli bulbs, $5 per 1,000. All bulbs, roots, root stocks, corms, tubers, and herbaceous perennials, which are ted for horticultural purposes, 20 per cent ad valorem; cut flowers, fresh or pre-d, 25 per cent ad valorem.

at increases the range so as to make the paragraph definite.

ith regard to paragraph 752, while the principal item in this graph, rose stocks, represents a raise of 100 per cent over the nt tariff, it is acceptable; but the whole wording of this para-h should be changed to prevent a serious loss of revenue; rose

stocks being differentiated from rose plants. The present duty on rose stocks is $1 per thousand and on rose plants $40 per thousand, so that under this paragraph as it now reads, "seedlings and cuttings of manetti, multiflora, briar, rugosa, and other roses, $2 per 1,000 plants," rose plants would be dutiable at $2 instead of $40 per thousand.

Our organization recommends that paragraph 752 be changed to read as follows, which will make it more concise and make it produce more revenue and be understandable to the Government officers as well as to the importers:

Seedlings and cuttings of manetti, multiflora, briar, rugosa, and other rose stocks 3 years old or less—

So as to define them—

$2 per 1,000 stocks. Rose plants, budded, grafted, or on own roots, $40 per 1,000 plants; cuttings, seedlings, or grafted or budded plants of other deciduous or ornamental or evergreen trees, shrubs, or vines, including greenhouse plants, 20 per cent ad valorem.

That makes that paragraph very much more comprehensive and more definite. We have been having to hire lawyers for years to interpret the tariff, and we want a tariff so that we can understand it without having to hire a lot of lawyers to interpret it.

Above all, we recommend that the items mentioned above which are now dutiable on a specific or per thousand basis be retained on a specific basis. There is no market value on such items, and as several hundred varieties each of tulip and narcissus and hyacinth bulbs are imported, an ad valorem duty causes loss of revenue by the changing of varieties on consular invoice. We want a specific duty on everything that can come in under that heading.

While the American-value plan of the House bill is perhaps practicable on manufactured articles, it is wholly unworkable on the horticultural items we are interested in. Such items are imported only because they can not be commercially produced in this country. Hence there is no American value except cost price after the duty and importation expenses are added; and, being raw materials, they do not compete with other items of American production but are required by American producers. Ad valorem duties on bulbs would result in loss of revenue to the United States through the substitution of varieties by dishonest foreign exporters, making it difficult for honest American importers to compete with them.

These items are imported wholly from Japan, Holland, England, and France, where the value of currency is not materially reduced. Since all items in paragraphs 751 and 752 are imported only because they can not be commercially produced here, the trade requires no protection; hence, the sole purpose of the duty is to provide revenue, but unless these paragraphs are corrected in the Senate bill the revenue will be largely lost by the injury done to horticultural interests.

After a careful study of the duty rates and verbiage of the House bill as compared with the present tariff, you will agree with us that the above recommendations will increase the revenue without further dislocating business. Hence we earnestly seek your cooperation in having the horticultural schedule changed in the Senate bill as suggested.

ALMONDS.

[Paragraph 754.]

ATEMENT OF T. C. TUCKER, MANAGER OF THE CALIFORNIA ALMOND GROWERS' EXCHANGE, SAN FRANCISCO, CALIF.

ienator SMOOT. Will you give your name and address and whom u represent?

Mr. TUCKER. T. C. Tucker; I am manager of the California Almond owers' Exchange and my address is San Francisco. I represent California Almond Growers' Exchange.

ienator SMOOT. You may have 15 minutes, Mr. Tucker, and you y file any brief that you desire.

Ir. TUCKER. I first want to express my appreciation of your cour-y. I would not have asked for this opportunity to appear before I had it not been very, very necessary that I return home, for the son that our crop is coming in at the present time and my duties manager call upon me to finance and handle and sell the crop. refore I had the choice of asking to be heard at this time or of ng home without being heard.

Briefly, the California Almond Growers' Exchange is a nonprofit ociation of growers, representing about 85 per cent of the almond). Its membership is very nearly 4,000. We have more than a dred thousand acres of almonds planted, mostly nonbearing. Our stment is something over $50,000,000.

alifornia has been producing almonds for many years commer-ly, but only in a limited way until the last few years. Prior to) the average annual production of almonds in California was ut 2,000 tons. In 1919 the production was 7,500 tons and in 1920 roximately 6,000 tons. Practically all of our crop prior to 1919 marketed as almonds in the shell.

mator WATSON. Where is your competition?

r. TUCKER. Our competition is from Spain and Italy, principally l the Mediterranean countries.

mator WATSON. Do you know about the difference in production s, generally speaking?

r. TUCKER. Yes, sir.

mator SMOOT. Is that in your brief?

r. TUCKER. It will be; yes, sir.

nator JOHNSON. State it generally, because you will occupy time ing in your brief to the figures.

nator WATSON. I thought he could just state generally the ition.

r. TUCKER. In 1920, not including interest, the cost of production alifornia was 14.3 cents per pound, and in Europe it was 3.6 cents pound.

nator SMOOT. Shelled or unshelled?

. TUCKER. That is based on the unshelled almonds. The differ-is 10.7 cents a pound. That does not include interest on either or capital invested in orchards or equipment. That represents ctual out-of-pocket cost for the production of almonds.

nator WATSON. Can you answer another question quickly? t is the American consumption and what proportion do you ly?

Mr. TUCKER. At the present time we supply from 20 to 25 per cent of the American consumption. Our acreage when bearing is sufficient to supply the normal demand of the United States.

I want to bring out this point right here, that the great demand for almonds in this country is for shelled almonds. Eighty per cent of the money spent for almonds is for shelled almonds, and this American market for shelled almonds is absolutely monopolized at the present time by the importers.

Senator SMOOT. Have you as good machinery for the shelling of them as they have in Europe?

Mr. TUCKER. In Europe almonds are shelled under the most primitive conditions, without machines, by hand, by old women and children, at night. In California we have invented and made homemade machinery which answers our purpose fairly well on which we will make other additions and experimentations and improvements. In California the shelling of almonds must be handled by machinery because of the labor situation.

Senator WATSON. What were your imports last year?

Mr. TUCKER. The imports last year of almonds were about 25,000,000 pounds.

Senator WATSON. Shelled or unshelled?

Mr. TUCKER. Shelled and unshelled, both. In 1919, under the most prosperous marketing conditions in America, the importation of almonds was 35,490,000 pounds.

Senator WATSON. Do they raise almonds anywhere in the United States except in California?

Mr. TUCKER. Only in California commercially.

Senator WATSON. Could you, if properly protected, supply the entire American demand?

Mr. TUCKER. When our present acreage is bearing.

Senator SMOOT. What percentage of your present acreage is bearing?

Mr. TUCKER. I would judge that less than one-fourth of the present acreage is bearing at the present time.

Senator WATSON. Now, let me ask you this, Mr. Tucker. Paragraph 754 of the bills says:

> Almonds, not shelled, 4 cents per pound; shelled, 12 cents per pound.

Is that the proper proportion?

Mr. TUCKER. Yes, sir.

Senator WATSON. Are you satisfied with those rates?

Mr. TUCKER. No, sir.

Senator WATSON. What do you want?

Mr. TUCKER. Five and fifteen.

Senator JOHNSON. Are those rates absolutely essential for the protection of that industry, Mr. Tucker?

Mr. TUCKER. Absolutely, Senator. And I want to say this, that in basing a request for a rate of 5 and 15 originally we selected the minimum under which we felt we could go ahead and develop the business along the lines that would warrant. Statistics show that the actual difference in the cost of production—and that is allowing everything in favor of the European—is 8 cents a pound on almonds not shelled and relatively 24 cents a pound on shelled almonds. That is taking the highest rates of wages, etc., in Europe.

Ve have taken the cost of labor in Spain, the cost of labor in Italy, l yet there are countries in Europe that are producing almonds ere the labor problem is easily solved.

just want to point out that we had a gentleman in our office ut a year ago from Palestine. Palestine has been producing onds for centuries. I asked this man, "How much do you pay r help, how much money?" He said, "We don't pay them any ney. We give them permission to eat of the fruits of the planta-." "Don't you give them any money to buy shoes or anything of that kind?" "No; they would not know what to do with a of shoes."

n Spain labor at the present time is from 25 to 35 cents a day. ght, as will be brought out in our brief, varies. It is one-fourth ne-third of our freight.

enator JOHNSON. The almond people feel that they may have dered in stating the original rates in the House at 5 and 15, use they fixed the very least possible rate on which they could . They asked 5 and 15, but if they had done like most industries e done, asked more than the very least possible rates upon which could live, they might have been reduced and they might have ived the 5 and 15.

that the way the almond people feel, Mr. Tucker?

r. TUCKER. That is correct.

enator JOHNSON. What is happening to your groves?

r. TUCKER. I want to say at this time, Senator—naturally, I think of a lot of things after I am out—that we have at the ent time a large percentage of our 1919 crop unsold; 1919, as know, was the most prosperous business year in this country. 1919 importations were the heaviest we have had, being an in-se of nearly 700 per cent over a period of some 15 years. Re-ly we shipped back from New York to San Francisco 5,000 bags lmonds we could not sell. The almonds had remained in the house, most of them for a year, and we could not get any kind decent offer for them, and finally their condition, by reason of ining in the warehouse, was such that we had to ship these nds back to California where they could be shelled and sal-d as well as possible. The bags had been stained and damaged. had gotten into them.

e have been anxious and willing to sell our crop at any reason-price we could get, but we found that every time we got into the et the other fellow seemed to be able to cut our price. That is cularly true of shelled almonds. There is a certain amount of nd for almonds in the shell.

nator WATSON. What can you sell them for profitably per pound w York?

. TUCKER. Under the present cost of production?

nator WATSON. Yes.

. TUCKER. The costs of 1920 were nineteen and a fraction cents nd for almonds not shelled. Freight is 2½ cents a pound addi-l. Anything above that would bring a profit.

nator WATSON. What does Italy or Spain lay them down for in York?

. TUCKER. At varying prices.

Senator WATSON. But they can always undersell you at that pri
Mr. TUCKER. Always. I think they always have been able t undersell us.

I want to say that of the 1920 crop, Senator, at the present tim we have approximately 30 per cent unsold.

Senator SMOOT. What kind of almonds are you speaking of no
Mr. TUCKER. Nuts in the shell.

Senator SMOOT. They are of different grades, are they not?

Mr. TUCKER. Yes. We have a proportion of all grades, but t great bulk of our crop is what we call the seedling varieties. W produce about 35 per cent paper shell and about 65 per cent seedling

Senator SMOOT. What do you get for paper-shelled now?

Mr. TUCKER. We have not been able to sell any for such a lo period of time that I do not know what we could get now.

Senator WATSON. Why have you not been able to sell any?

Mr. TUCKER. Because at the present time there is no sale for nu in the shell after January 1. The great year-round demand is shelled almonds. The consumption of nuts in the shell, by ha has been confined principally to the holidays.

Senator WATSON. You think that if there had not been any i ports you could have sold your product?

Mr. TUCKER. We could have shelled our product and have be able to enter the shelled-almond market. We have quite a quanti of shelled almonds now, and we found that shelled almonds w brought from the Mediterranean countries into the city of San Fr cisco and sold for less money to the people out there than the p previously prevailing on almonds in the shell. To-day the people California are eating the peasant-grown almonds of Europe.

Our business is right at the point where it either is going to ahead very fast or disintegrate. We are pretty good sports. We not going to pull up our trees, but are going to make the best fight can for a market; but if the grower for two or three years does get enough to pay for the cost of production, he can not keep very long. We have a little bank up in the Esparto district. of the principal products of the Esparto district is almonds. T grow almonds and grain. I think those represent their entire p duction. That bank is existing only by courtesy of the bank ex iner. They can not lend a penny to the growers in the district. situation is very, very serious, especially when almonds are the p dominant crop. At the same time we see in the East a demand shelled almonds and the consumer paying a pretty high price

Senator WATSON. That is a pretty fair statement. I think have given us all the salient facts, as many as you would have g us if you had talked for an hour. You have given the fundamen

Senator SMOOT. If you desire to file a brief you may do so.

Senator JOHNSON. Mr. Tucker may file a brief on behalf o almond people?

Senator SMOOT. Certainly.

Senator SHORTRIDGE. I thought it might be helpful to the mittee to submit these telegrams [indicating].

Senator SMOOT. I think we have just the same telegrams, Sena I have a larger bunch than that.

Senator SHORTRIDGE. I am not asking that they be inserted record—far from it—but I want to say, if you will permit me,

:e are a hundred and odd telegrams that have come to me not ly from the growers but from banks and bankers and shippers; of irse, all to the same effect.

They claim, and I believe it to be absolutely economically true, it they must have at least 5 and 15 cents, respectively, on the illed and the unshelled.

Senator WATSON. They have been very liberal in their telegrams th all of us.

Senator SMOOT. I think I have more than you have there.

Senator SHORTRIDGE. Of course, I have a great many letters.

EF OF T. C. TUCKER, MANAGER CALIFORNIA ALMOND GROWERS' EXCHANGE.

he California Almond Growers' Exchange, a nonprofit cooperative association of roximately 4,000 growers, operating under the cooperative organization laws of State of California, and representing about 75 per cent of the almond crop pro- ed in America, respectfully asks the Congress of the United States to grant the owing tariff schedule on almonds:

lates requested.—Unshelled almonds, 5 cents per pound; shelled almonds, 15 cents pound.

lates granted in Fordney bill.—Unshelled almonds, 4 cents per pound; shelled londs, 12 cents per pound.

Previous rates (cents per pound).

ear.	Tariff.	Un-shelled.	Shelled.	Year.	Tariff.	Un-shelled.	Shelled.
-1921	Underwood bill	3	4	1890-1894	McKinley bill	5	7½
-1913	Payne-Aldrich bill	4	6	1883-1890	Morrison bill	5	7½
-1909	Dingley bill	4	6	1864-1883	Morrill bill	6	10
-1897	Wilson bill	3	5				

The present Underwood tariff is the lowest since the Civil War. It has had no t of its protective powers, as it did not become commercially effective as regards monds until after the World War began. Furthermore, the Payne-Aldrich rates re, at the time they were in effect, the lowest since the Civil War with the exception three years from 1894 to 1897, when the Wilson bill was in effect. Previous tariff edules on almonds do not, however, constitute sound precedents upon which to ct just duties on almonds.

DOMESTIC PRODUCTION AND VALUE.

The domestic production of almonds is limited almost altogether to California, hough there are small areas in a number of other States where almonds are produced ccessfully. The normal production in California at the present time is about 12 to 15 illion pounds annually. In California, as in Europe, almond crops are more or less certain because of liability to frost injury. Large crops some years are offset by or crops other years.

While 3,000 tons of the 1919 and 1920 crops grown by members of the California mond Growers' Exchange remain unsold, the estimated value expressed in returns the growers is $2,500,000 for the 1919 and $1,500,000 for the 1920 crop. (Production ce 1900 is shown in Exhibit D.)

The California growers have received to date on their 1920 crops 10 cents per pound r some varieties and 7 cents for others. Due to deterioration, spoilage, storage arges, and loss in value through age, total returns to the growers on this crop can but very little more than they have already received.

Foreign competition comes chiefly from Spain (over 50 per cent) and Italy (over per cent), with some production in France and other Mediterranean countries. Total oduction in the Old World is estimated at approximately 700,000,000 pounds. Production by countries may be found in Exhibit D.)

American importations of almonds amounted to approximately 35,000,000 pounds 1919 and 25,000,000 pounds in 1920. Figures supplied by the United States Bureau

of Foreign and Domestic Commerce show the total value of the 1920 importations to be $7,786,910. The total value of the 1919 importations according to the same authority was $11,887,346. Segregating values for shelled and unshelled almonds imported shows that the value of unshelled imported during the calendar year was $1,017,984, while the value of shelled almonds for that year was $6,768 … almost 7 to 1.

In weight the unshelled shipments to this country in that year amounted to 6,7… pounds, while the shelled nuts weighed 18,150,588 pounds. (Detailed information … imports may be found in Exhibit I.)

A very careful estimate of acreage based on reports from over 1,200 growers throughout California indicates that there are at the present time considerably over … acres of soil planted to almond orchards, numbering in the aggregate approximately 7,000,000 trees. The capital investment of the growers in California is … conservatively at over $50,000,000. About 20,000 white laborers are employed in culture and harvesting of almonds seasonally.

The basic rate on unshelled almonds granted in the Fordney tariff bill is … low. It is impossible for us to compete with the cheap European products on the rates which prevailed before the war.

With an 8-cent rate on unshelled almonds justifiable solely on the basis of … in cost on a prewar basis, experts are agreed that 5 cents is a reasonable … postwar conditions. In asking a 5-cent and 15-cent schedule of duties the American almond grower rests his case upon the wide divergence of production costs … peasant-grown Mediterranean almonds and the California product employing … can labor and modern American methods and machinery.

The estimates of foreign costs used in the calculations contained herein are … at 25 per cent of American costs, though official and unofficial figures of labor as given in Exhibit A, all show them to be only 10 per cent to 20 per cent of American costs. For safety, calculations reducing foreign money values to American … are figured at higher exchange rates than actually prevailed at the time … the data presented. This gives any advantage that may exist to the foreigner … than the American producer. In fact, such a method has been pursued through… fully recognizing that the merits of the case being presented are sufficiently … vincing, even if estimated to favor the foreign producer.

In Tariff Information, 1921 series, in a publication of the Committee on … and Means, entitled "Wages in the United States and Foreign Countries," is a … résumé of wages on page 6, which shows that Italian labor costs in agriculture … only 20.75 per cent of American costs. On page 34 of the same publication … labor costs are shown to be but 13.30 per cent of American costs. Furthermore … the same page it is shown that costs in the far West are well above the average … United States. In spite of this official evidence we have, for safety, figured … costs at 25 per cent of American costs.

Estimates on California costs are based on the results of the investigation … lished in Bulletin 297 of the California Agricultural Experiment Station, … "The Almond in California," by R. H. Taylor. These investigations cov… continuous period of six years.

Figures on European costs are shown in detail in Exhibit A. The official … quoted fully bear out the conservatism of our estimates of foreign costs as comp… with those of California. We would call particular attention to the report, No. … of the American consul at Malaga, Spain, dated July 11, 1921, given in Exhibit … This report throws much light on European methods and costs in general.

This report shows that men who may be used as foremen in almond or… Spain received from $0.63 to $0.76 per day with quarters but no meals. … male labor receives from $0.44 to $0.50 per day without meals, or $0.25 per … board. On the other hand, ordinary California labor at the same time cost… a day. In Spain "the average earnings of a farmer laborer aided by his … children," the consul reports, "are from 1,000 to 1,500 pesetas annually," … to $189.30 in American money.

The American consul further reckons the Spanish cost of production, … taxes, interest on investment, exhaustion of soil, and all other charges, at from … to $0.0997 per pound of shelled almonds, or, on the basis of American shelling … ages, which are more favorable than the foreign, $0.0249 to $0.0332 per pound un… On the basis of foreign shelling percentages given by the American consul, the … pound on unshelled almonds is from $0.0187 to $0.0249 per pound.

Recent consular reports from other Spanish points are in accord with the … Consular reports from southern Italy show costs in the almond-producing … be much less than those used in our estimate. Labor costs in both Europe a… fornia, as shown in Exhibit A, are quoted from official sources as indicated.

'laims made by opponents of the American almond farmers that California almond ıds are overvalued are disproved by a report made by R. L. Adams, professor of m management of the University of California, in 1916, on comparative land values California. (His estimates are given in detail in Exhibit J.) Prof. Adams shows it the high price for land adaptable to almond culture in California in 1915 was $300 acre, the low price $100, and the usual price $150. These figures are at the bottom he list of fruit-land values in the State. According to the same author the high ue of developed almond orchards in 1915 was $800 per acre and the usual $400 per e. No other developed fruit land in California sold as low. After a later and more austive study, reported in Bulletin 297 of the California Agricultural Experiment tion, the average value of bare land ready for almond planting in California was ced at $250 per acre, while the average value of land in bearing was placed at $500 acre. There is an apparent discrepancy in these valuations due to the fact that ams's figures cover land in raw condition, while those in Bulletin 297, in a general r, cover cost of rough clearing necessary before the land is ready for laying out for hard purposes. These reports dispose of the argument that the California almond wer is overburdened with a top-heavy capital investment. He has the least land t of any class of California fruit grower. This is unquestionably due to the poor urns almond growers have had in the past and are now receiving.

'he charge has been made that the efforts of the California almond growers to ure a readjustment of the tariff rates is nothing more than a gigantic land-promotion eme. As a matter of fact, the company referred to had nothing whatever to do h any effort to secure an adequate almond tariff. They have made no efforts mselves, nor have they communicated with us or we with them in any way. ely the Senate Committee on Finance can not for a moment consider as com- ent evidence or argument newspaper real-estate advertisements designed to dis- e of lands by promotional companies.

'urthermore, we maintain that no matter how many land-promotion schemes have been launched in California, and most of them have been perpetrated by residents of California with nonresident capital, the fact remains that the orchards sold to private owners, who are entitled to fair returns from their almond orchards a reasonable valuation basis. This, of course, assumes that the orchards have n planted on adaptable land, which has, generally speaking, been the case. Our ires are not in any way based on promotional land values but upon conservative mates of land valued for other purposes.

t should be further borne in mind that our claims for tariff revision are more than ified by valuing the land at $1, or in effect not considering land value at all.

DOMESTIC MARKET CONDITIONS.

'onditions in American almond growing have been revolutionized since 1918. to and including that year the California almond growers, by sound business thods and judicious sales and advertising methods, were able to create markets their entire crops annually in the shell. In 1919, however, production, steadily reasing year by year, reached a point where the American unshelled-almond rket was satiated. This condition was aggravated with the harvest of the 1920 p, and the American grower, despite the fact that he has taken losses of from 9 to 12 cents per pound on portions of the 1919 and 1920 crops sold, has still on d 3,000 tons of almonds from those years, with the 1921 crop of heavy propor- is being harvested at the present time.

'he unshelled-almond market is seasonal and limited. The American growers e only one hope with production increasing heavily as thousands of trees come bearing annually, and that is the American shelled-almond market, which ays has been and is now completely in control of the handlers of the Mediterra- n crop. It is a physical fact, not a theory, that if the American grower can not his almonds he will not pay upkeep costs on his orchards, and American almond wing will languish into eventual extinction.

n a few instances growers have recently begun pulling up their trees or grafting m over to other fruits. The latter procedure can not be done on many types of d adapted to almonds, however, and in such instances the land must eventually ert to pasture. This is unfortunate, as it requires from 5 to 7 years of unpro- tive labor and investment to bring an almond orchard into commercial bearing.

othing less than a 5-cent and 15-cent schedule will permit the American grower to n a foothold in the American shelled-almond market. This market absorbs 80 per t of the money spent for almonds in this country. The American farmer can not e to enter it under the 4-cent and 12-cent schedule provided in the Fordney bill.

This tremendous increase in production, with further increases to come, ma obvious the earlier statement that previous tariff bills constituted no sound prece upon which to erect equitable almond duties in the tariff bill now before Congre

The domestic production is more than sufficient to supply the entire dom consumption of unshelled almonds and soon will be able to supply the domest sumption of shelled almonds as well. This is evident from the fact that 100,000 a of orchards producing 700 pounds to the acre will produce, when all the tree bearing age, approximately 70,000,000 pounds. New acreage already planted ab the 100,000 acres of 1918 will place the coming California production far beyond 1920 total American consumption of 68,854,945 pounds on the unshelled basi estimate is arrived at by multiplying the shelled imports by 3 to put them unshelled basis, and then adding the unshelled imports and the total American duction less the portion of the crop still on hand unsold.)

Freight rates from California to all points east of the Rocky Mountains are fro to 3 times higher on regular established lines than they are from the Mediterra ports to New York. This is clearly shown in Exhibit C. In many case steamers bring cargoes of almonds for little more than the cost of handling, maki cost of transportation as low as one-sixth of the freight rates from California in lots.

QUALITY OF DOMESTIC AND FOREIGN ALMONDS.

The claim, often made by the importers and others, that the California almond inferior to the foreign almonds, being woody and dry in texture, lacking in oil unsuited to the needs of the manufacturers, is entirely unfounded in fact. In Annual Report of the Director of the California Agricultural Experiment Statio the year ending June 30, 1919, on page 37, is given a table of analyses of foreign domestic almonds. On page 38 he comments as follows:

"The nutrition division, cooperating with that of pomology, made complete ch cal examination of 14 different varieties of domestic almonds grown at Davis and the sake of comparison, 5 varieties of imported nuts.

"The following table contains the analytical data for these nuts. The impo varieties were received in the shelled form, and, therefore, no figures are given refuse or shells.

"The data presented are interesting in showing that the domestic almonds are in nutritive value to the imported article. The protein content of the former is h on the average than that indicated by the latter, while the average for the nitr free extract is correspondingly lower."

The table as printed is given in Exhibit G, together with further comments nished by Prof. Jaffa, of the nutrition division.

The unshelled-almond business is a seasonal one, limited almost altogether holiday season and covering a period of not over three months. Consumption class of business can not be increased indefinitely. With the keen charact competition from the foreign unshelled product we must have some of the she almond business in order to dispose of our surplus, which now amounts to more we can sell in the shell and more than California has previously produced in any year.

From 5 to 12 million dollars annually goes to southern Europe from this co to pay the pauper labor of those countries, while American producers can n their product even at a loss. There are no exports of almonds from this countr never have been. We can not even get business in Canada on account of the abi of the foreign producer to undersell us.

Spain, Italy, and France have all enacted higher tariff schedules than hav existed before in those countries. They have taken cognizance of increased and have raised their rates accordingly. Spain and Italy particularly have much higher duties on most commodities exported from the United States. frankly admit that they are aiming to keep their own domestic manufacture Under such conditions should not America protect her own industries, whe protection is sadly needed, as in the case of the almonds? At the same time foreigners are protesting high tariff duties in America they themselves are do very thing they object to on our part. The United States Department of Co has in its possession the tariff schedules of these countries, which corrob statements just made.

The 4-cent rate on unshelled almonds was barely sufficient under the most conditions existing before the war. A 1-cent increase to 5 cents certainly for many years, if ever, give us a greater chance in the market than before and under conditions probable for the next few years will not give us that m

The United States is now a creditor nation. The gold reserve in this country is ormous. It is entirely improbable that living or other costs will return to prewar ndards as compared with other countries for a good many years, if ever. This ndition alone would warrant an increase in the rate of 1 cent per pound above the yne-Aldrich rate, which tariff was in effect, as far as almonds were concerned, ctically to the beginning of the World War.

t is evident, therefore, that an increase to 5 cents on unshelled almonds will still ve us at a disadvantage and force us to fight hard for any share of the market for helled goods.

merican producers never have had any share in the shelled-almond market on ount of the illogical rates obtaining in the past on shelled almonds as compared h unshelled, with the result that it has been impossible for us to compete success-y with the foreign product, which was always able to just underbid any quota-s we might make.

fter investigations by members of the agricultural subcommittee of the Committee Ways and Means, the proper ratio of rates on shelled and unshelled was found to 3 to 1. That ratio was accepted as correct by the full committee, as shown by the s of 4 cents on unshelled and 12 cents on shelled almonds provided in the Fordney ff bill as passed by the House.

recent test of shelling percentages conducted by the United States Department Agriculture shows that the average meat content secured from shelling, by the t and most up-to-date shelling machinery in California, of 12 leading varieties of ifornia almonds to be less than 33 per cent. The varieties tested represent the t bulk of the entire California production. (Quotations from the official report his test are given in Exhibit F.)

Vith a reduction in weight by shelling from 3 pounds of unshelled almonds to 1 nd of shelled almonds or almond meats for the domestic product, and from 4 pounds nshelled almonds to 1 pound of shelled almonds for the foreign product, it is evi-t that to enable us to compete the rate on shelled almonds should be three times rate on unshelled in order to give the same returns as if unshelled, and this does figure the cost of shelling at all. As a matter of fact, cost of shelling in southern ope is practically nothing, as it is done by the peasants' families at home at e times and in the evening in their huts, while the American workers must be paid stantial wages, and machinery, equipment, and power necessary for operation t be provided at additional expense.

he California almond growers have a well-equipped automatic almond-shelling nt at Sacramento, the only one of its kind in the world, representing an investment ver $300,000, which has never yet turned a wheel commercially. This plant was lt in anticipation of the imperative necessity of getting into the shelled-almond iness and with the belief that Congress would afford the necessary relief when the e came.

rate of 15 cents on shelled almonds is in keeping with the comparative value of product and will do no more than enable the American producer to fight for a e of the market for shelled almonds and will in no way shut out the foreign prod- As a matter of fact, what it will mainly do will be to insure to the American lucer new markets, which he may, by his own initiative, develop. Under pres-conditions, as soon as a market is developed by our producers the foreigner is able ome in and take it completely away from us. We need, therefore, protection nst such a procedure in the future. Even at the rate requested every effort must put forth to maintain markets which we may develop for ourselves through wide-d advertising and sound business procedure.

pon the American almond growers' ability to gain a foothold in the American led-almond market lies the salvation of almond culture in the United States. American growers can not persist in their life's work, to which they have devoted s of toil and millions of dollars, unless they are given a fighting chance to compete the Mediterranean growers by adequate adjustment of cost of production differ-als through the imposition of a 5-cent and 15-cent tariff schedule. In asking these es our American growers are seeking the absolute minimum protection which will ble them to compete with the peon labor of southern Europe and the cheap meth-and equipment employed in the foreign almond-producing countries.

comparative study of prices received by the foreign grower and those received the California grower shows that the foreign producer receives a most variable e, while the domestic producer, before the present complete demoralization of market, received considerably more. In this connection, it must be remembered t foreign quotations are always higher than the prices actually received. Cor-

respondents in Europe invariably state that such is the case and that it is done [illegible] the very evident intent of boosting the market.

Here again it must be thoroughly understood that prices quoted in foreign [illegible] must be reduced considerably to represent the prices at which actual sales take [illegible] The declared value of imports into the United States is based upon quotations [illegible] time shipments are made, rather than upon the actual sales price.

RETAIL PRICES OF ALMONDS.

An examination of the schedule of retail prices in Philadelphia and New York [illegible] a comparison with the varying tariffs indicates that retail prices are no higher [illegible] high tariff than with a low tariff. In other words, the revenue that should have [illegible] to the Government has been going into the pockets of speculators in foreign alm[illegible] Murton observes that fortunes are constantly being made and lost in the [illegible] business in Spain due to speculation. It is safe to say, also, that fortunes are [illegible] made in foreign almonds here due to the large margins of profit which are [illegible] under conditions as they exist in this country.

An examination of a list of retail prices mentioned above shows that almonds [illegible] selling at Philadelphia as far back as 1899 for 35 cents a pound. In no year sinc[illegible] time have they exceeded that amount until the year 1918, when they went to 40 [illegible] In view of the unusual conditions throughout the country and abnormal increase [illegible] costs of all kinds, this increase is not to be compared with those which have [illegible] place in other commodities.

It is well to call attention to the business philosophy of the California A[illegible] Growers' Exchange. It has been the policy of the exchange from its inceptio[illegible] 1910 to sell at the lowest figure possible consistent with a fair return to the gr[illegible] The repeated statement of the manager of the exchange has been that "if we [illegible] take advantage of the consumer one year because we find ourselves in a positio[illegible] so, we shall pay for it in the following year." This policy of selling at the [illegible] possible prices consistent with returning a reasonable profit to the producer [illegible] encourage the widespread distribution of the product through the maximum [illegible] opment of old and new markets. Up to the time the American market [illegible] saturated at the close of the World War the effectiveness of this policy was [illegible] demonstrated. Figures secured from the Bureau of Foreign and Domestic Comm[illegible] on retail prices in New York for the Nonpareil almond show that this variety [illegible] uniformly lower prices from 1913 to 1917, inclusive, than from the period be[illegible] 1907 and 1912. Prices for the earlier period were from 4 cents to 8 cents hig[illegible] Remembering that the association was organized in 1910, but took two or three [illegible] to gain sufficient strength to materially affect the market, these figures are strik[illegible]

We believe the figures on retail prices show that the operation of the growers' [illegible] zation to date has resulted in lower prices to the consumer than would other[illegible] have obtained due to a sane selling policy as outlined above and to more econ[illegible] methods of distribution. Here we might call attention to the fact that while [illegible] commodities rose in value from 100 to 200 per cent and even more from 1915 [illegible] the retail price of almonds generally only rose about 30 per cent during the [illegible] period.

Under such conditions it is reasonable to expect the California producer, if [illegible] aged to produce in quantity by adequate tariff protection, to develop new [illegible] for shelled almonds and stabilize old ones, until eventually the consuming [illegible] will pay less for the American product than they have for the foreign. All [illegible] is an opportunity to demonstrate these possibilities.

If the increases to 5 cents and 15 cents are not granted, the California [illegible] industry must languish and eventually die through neglect. This is no idle [illegible] ment. Without returns sufficient to pay production costs, orchards must [illegible] sity be neglected; cultivation, spraying, pruning, and other operations [illegible] omitted. The obvious result will be a gradual deterioration of the orchards [illegible] finally they must die or be dug up, with consequent loss of years of toil and [illegible] financial investment. A forecast of this condition may be drawn from a letter [illegible] by the president of one of our California country banks at Esparto. (See Exhi[illegible]

Returns to California producers have never been high and are now far bel[illegible] of production. If the entire amount of all previous crops were fully sold, the [illegible] returns on the entire crops of members of the California Almond Growers' Ex[illegible] would have been as follows: 1910 to 1916, inclusive, \$0.1309 per pound; 191[illegible] inclusive, \$0.1265 per pound; 1920, \$0.1408 per pound.

The first two prices above indicate actual conditions. The figure for 1920 [illegible] upon what the growers would receive if entire crop were sold at prices prevailing [illegible]

des were possible. As a matter of fact, 3,000 tons of the crops of the past two years ill remain on hand, and deterioration and storage and other costs make it probable iat little further returns on these crops will be made to the growers. It is evident, ierefore, that this figure is too high. The actual facts pointed out above show that ie growers have not received over 8 cents per pound, the 10 cents being paid on onpareil and similar varieties representing but a small proportion of the crop.

A false impression has been given by the importers in their testimony before the enate Committee on Finance (see Committee Print, Part 29, Aug. 30, on the tariff, H.R. 56, p. 2329), in which they quote the retail prices of almonds and then draw the nclusion that the difference between the grower's cost of production and the retail ice is all profit to the producer. It is perfectly evident to anyone desiring a fair atement of the matter that from this difference in price must be deducted the profits all the handlers along the line, including broker, wholesaler, and retailer, as well transportation and other similar costs attendant upon the marketing of any crop.

They further quote Mr. Tucker as having stated that the cost of producing almonds 1920 was approximately $0.16 a pound. That is a palpable error, as all of our claims id all the figures show that the cost was over $0.19 a pound. All of the evidence bmitted by the California Almond Growers' Exchange is aimed to bring out the conrvative nature of the estimated cost of $0.1945 per pound.

The demand for unshelled almonds is limited, being confined principally to the liday trade, the demand for these after January 1 being very light. Numerous iorts on the part of California producers to develop a year-around trade in this class goods has proven that such development is necessarily limited.

The demand for shelled almonds is continuous the year round, the nuts being used confectioners, bakers, paste manufacturers, and many others. This market, on e other hand, is susceptible of a reasonable amount of development if rightly handled. ie speculator can not and will not attempt to develop new markets. The producers, ien organized as the California growers are, can and will foster developments of these arkets in such a way as to be beneficial to all concerned, provided, of course, that e proper stimulus for normal competition is provided by an equitable import duty.

Up to the present time California almonds have been marketed almost altogether in e shell, the small percentage (less than 3 per cent) sold shelled being marketed st of the Rockies.

Those California almonds which have been shelled in the past have been largely off ades that could not be handled otherwise, such as "sticktights" and "rain-stained" its. The balance were shelled in the hulling machines, which are used to separate e whole nuts from the hulls which surround them at the time of harvesting. A rtain amount of such shelling can not be avoided.

The estimated total output of shelled almonds in California amounts to only a small iction of 1 per cent of the total amount of almonds consumed in the United States, d of the shelled almonds only that were so consumed.

In 1919, under the most prosperous marketing conditions this country has expericed, the almond grower offering his product at a price that did not yield to him more an the cost of production plus a fair interest on his investment could not sell his op, and there is to-day in the warehouses approximately 9 per cent of that crop at could not be sold because of the overproduction of almonds for sale in the shell d the low price at which almonds from the Mediterranean were imported. Over per cent of the 1920 crop is also still unmarketed. The prices at which the balance this crop must be sold will not even return the cost of production.

The limit of marketing almonds in the shell having very evidently been reached, e growers must plan to develop a domestic trade for California shelled almonds, d this must be done quickly in order to care for the rapidly increasing size of each w year's crop. With each coming year additional acreage will come into bearing the same way as that indicated by the doubling of production from 1915 to 1919. n examination of Exhibit D will show the detailed character of the increase.)

With the present low tariff it is impossible to get into the shelled-almond business th our rapidly increasing tonnage for two reasons: First, at present prices the cost shelling and handling completely prevents competition except at a heavy loss the California producer; second, because the competition from abroad and the possility of underselling prevents the American producer from investing the necessary pital to put the shelled-almond business on its feet.

In other words, with the present duties, foreign competitors are underselling the nerican producers to such an extent as to keep them out of the shelled-almond isiness completely. Some relief must be provided soon.

PROFITS ON IMPORTED ALMONDS ENORMOUS.

To the claim of the importers and manufacturers that the proposed rates will increase the cost to the consumer so much that it will greatly curtail consumption, we reply by stating it as our belief that they can absorb the increased duties without increasing the cost, and in support of this statement quote the following article from the first page of the New York Times for Monday, August 1, 1921:

"Candy company cuts prices 50 per cent. Concern's head says it is undeniable 300 per cent profits have been general. Ice cream and sodas, 10 cents. Fancy chocolates go from $1 to 59 cents; bonbons drop to 39 cents; hard candy, 29 cents; brittles, 15 cents.

"Reductions amounting to approximately 50 per cent on candies, ice cream, and soda-fountain drinks go into effect to-day in the Miller Candy Co. in the confectionery stores, said an announcement last night by Benjamin Miller, head of the corporation controlling this chain of stores. This is the first general reduction to be made since the war by the Miller Candy Stores, of which there are seven in Manhattan and [illegible] in Brooklyn.

"In a memorandum sent to Herman Heide, head of the Confectioners' Association, Mr. Miller says that the confectionery stores generally have been making a profit of 300 per cent on their goods, which are classed as luxuries. He says he has found that he can cut his prices in two and still make a profit. Despite any action that may be taken by his association, Mr. Miller feels that he is doing the right thing by reducing the prices in his stores to prewar levels and so doing his bit to help along the 'return to normalcy,' advocated by President Harding. The price reductions, he explains, affect everything in the Miller Candy Stores, including expensive candy, both boxed and loose, and ice cream and ice-cream sodas. His statement addressed to Mr. Heide is as follows: 'The order goes into effect Monday morning, August 1. I know that it may not seem regular, but I am faced with two facts of business. One is that for several years we have been getting nearly 300 per cent on what are called luxuries. That has been the profit. It is undeniable. The other is that in a brief experiment it has been shown to me that I can make a regular profit by getting down to natural business tendency, and the tendency is to restore what President Harding calls normalcy.' "

Under a 5-cent and 15-cent tariff schedule the California almond growers are convinced from years of experience that they will have to constantly develop new and broader American markets to give outlet to their annually increasing production. This will work in favor of the American consumer eventually by cutting the cost of almonds on the table. The American almond grower realizes that he must popularize the almond, especially the shelled nut, the same as the peanut has been in the minds of the consuming public. He can do this only by national advertising and low prices. The California Almond Growers Exchange is planning to put up almonds in consumer packages to educate the American public to eat almonds, and at the same time protect that public against excessive distributors' profits by stamping the price on the package. The American grower knows that in doing this he is also developing markets for the foreign grower in the United States. Consequently, he does not look forward to any appreciable decrease in importations. On the contrary, importations are likely to increase under future conditions, even with a 5-cent and 15-cent tariff schedule.

The consumer gets no benefit from a foreign monopoly. The importers never have and never will carry our advertising campaigns to inform the consumer of the uses or value of almonds in any form nor will they make any efforts to develop new markets. This is the natural function of an American organization and should be encouraged. To do this involves an outlay of money for advertising, equipment for handling, packing, etc., and to do so the growers must be assured of an opportunity of continuing to sell in the markets in which they have spent money to develop without the danger of the importers taking the entire market away from them after having been developed. Under present conditions this is not only possible but has been done many times.

REVENUE TO THE UNITED STATES.

An almond tariff schedule of 5 cents and 15 cents would mean an average revenue to the United States of $2,964,024.65. This figure is based upon the average imports for the years 1914 to 1920, inclusive, these average importations amounting to [illegible] pounds of unshelled almonds and 17,989,274 pounds of shelled almonds. The average is below present annual importations and is therefore a fair basis of computation. (Details of these figures are given in Exhibit II.)

Claims of the almond importers that the 5 and 15 cent schedule of duties asked ll shut out importations are obviously without substantiations. If foreign exportg and American importing margins of profit are so large and have proven so elastic the past, when the American almond grower tried at various times to enter the nerican shelled-almond market, it is reasonable to believe that the duties asked ll be absorbed by the foreign producer, the exporter, and the American importer, d that the American grower and distributor will find keen competition in the nond markets of the United States.

If the American producer is throttled by being forced to produce at a loss, the rection of said production to a minimum once more will give the foreigner full control the American market at his own prices.

Even if the entire cost should be passed on to the consumer, it would not amount more than a total of 4 cents per capita per year, as shown by the following table:

Consumption of almonds in United States per capita.

[Figures given are for the fiscal year ending June 30.]

	1920	1921
	Pound.	*Pound.*
shelled almonds	0.065	0.061
lled almonds	.247	.130
lled as if unshelled (x's 3)	.741	.390
Total, on unshelled basis	.806	.451

Surely the committee and Congress will bear in mind that the almond is not a basic d necessity. Less than half a pound of almonds were consumed per capita in the ited States during the year ending June 30, 1921. This might well give rise to the racterization of the almond as a luxury, and the strongest argument against a protive tariff for American almond growing could not brand the schedule asked as a upon the mass of the American consuming public, even if the import duties were t to be absorbed by the foreign grower and exporter and the American importer.

CALIFORNIA THE LOGICAL PLACE TO PRODUCE ALMONDS.

National economy of natural resources demands the utilization of adaptable lands points distant from the marketing centers of the country for the production of ncentrated crops of high unitary value, thus tending to equalize transportation and tribution costs as compared with gross products of low value. Only in this way can highest efficiency be secured in the use of the land and of the labor of the procer and his employees. The Nation should, therefore, encourage the production relatively high-value crops, such as almonds, at distant points, as in California, l especially where such distant points are so well suited to their economical duction.

Arguments that the American almond growers should be denied adequate tariff ties because European countries must sell their goods here to pay their debts has its corollary that 5,000 American citizens, who have invested their toil and their ney in the soil, should be put in pawn in Europe's effort to exchange her depreciated rency for sound American dollars. The American almond growers are loath to ieve that a Republican administration will consider an argument so specious.

CONCLUSION.

The almond growers of California, therefore, respectfully and earnestly request that rate on unshelled almonds be raised to 5 cents and on shelled almonds to 15 cents. have from the very start asked for barely sufficient to enable us to continue in siness. From the many expressions of principle and belief enunciated by the ders of the Republican Party in Congress we feel fully justified in asking most nestly that these rates be granted for the most conservative protection of an instry owned and operated by Americans. They feel certain that if the Senate mmittee on Finance recommends their just plea the House of Representatives will ncur.

EXHIBIT A.

Comparative cost of producing almonds in California and Europe.

[All foreign costs figured at 25 per cent of California costs, though actual costs in Europe much le-

	Including interest.		Not including interest.	
	1915	1920	1915	1920
California........per pound..	$0.109	$0.195	$0.066	[illegible]
Europe........do....	.027	.049	.016	[illegible]
Difference........do....	.082	.146	.050	[illegible]

The above figures are based upon the data immediately following.

Average cost of production per acre of all bearing orchards in California.

	1915	1920
Maintenance:		
Pruning	$3.00	[illegible]
Plowing	2.75	[illegible]
Harrowing	.75	[illegible]
Cultivation and weed cutting	3.00	[illegible]
Spraying	3.00	[illegible]
Irrigation	2.00	[illegible]
Handling:		
Harvesting, hulling, etc	20.00	[illegible]
Warehousing (including bleaching), at one-fourth cent per pound	1.75	[illegible]
Miscellaneous expense for maintenance and handling	2.00	[illegible]
Overhead charges (not including interest):		
Taxes and insurance	4.00	[illegible]
Depreciation on working equipment only	4.00	[illegible]
Cost per acre	46.25	[illegible]
Cost per pound	.066	[illegible]
Interest at 6 per cent on valuation of $500 and $600 per acre, respectively	30.00	[illegible]
Total cost per pound	.109	[illegible]

Depreciation on buildings and trees and other unfigured costs are too variable to estimate, but they must come from the profits.

Valuation of land is based upon the conservative value of bare land plus the a[illegible] cost of bringing same to bearing age. The interest charge covers the entire cost [illegible] bringing the orchard to production, as well as the value of the land itself, wh[illegible] latter charge constitutes only one-half of the full interest charge. Even if inter[illegible] on the land should not be allowed in the calculations, certainly interest should [illegible] allowed on the cost of the developmental work necessary to make a producing orchard.

Costs in southern Italy, where almonds are produced, are even less than in north[ern] Italy, in which latter portion the province of Vicenza is located. Labor is be[tter] organized in the north and consequently better cared for and better paid. Th[e] figures given are without board or furnishings of any kind.

Exhibit AA.

THE ALMOND INDUSTRY IN THE MALAGA CONSULAR DISTRICT.

[American Consulate, Malaga, Spain, July 11, 1921.]

The production of almonds in the Malaga consular district must be considered u[nder] two separate heads:

1. The production and cost of the shelled almonds to the grower.
2. The handling and added cost of these almonds after being cleaned, polish[ed], assorted, and packed by the almond exporter ready for shipment.

1. The arroba is the usual standard unit of measure in the almond trade of [the] interior. One arroba equals 11½ kilos, or approximately 25½ pounds.

The entire crop of almonds in this district, both "Jordan" and "Valencia," a[re] all shelled by hand right on the farm where they are grown. They are cracked b[y] hand; the only implement used for this task is a flat stone held between the kne[es of] the sheller, who is seated, and a small bar of iron or smaller stone used as a hammer.

There are practically no paper shelled almonds produced in this region. Th[e] almond trees are found both along the coast and in the interior. The tree blossom[s in] January and February and the nuts are ripe by July. They are then knocked o[ff] of the tree with sticks or poles and left on the ground in order to dry the husk and [...] preparatory to shelling.

Only shelled almonds are known and traded on the local market.

There are no agricultural statistics obtainable here with reference to this cr[op] which, as a rule, is not a staple one. Formerly every farmer had a few almond tre[es] from 25 to 300, which were grown on hillsides where the soil could produce little e[lse]. During the past seven or eight years the farmers have begun to pay more atten[tion] to this crop, and having observed that they obtained considerable higher prices [for] the larger size almonds, are now usually more careful to prune their trees, white[wash] the trunks, turn up the earth around the roots, and in some instances even ma[nure] the soil where possible.

The almonds from these trees are usually gathered by the farmer or his famil[y in] the off hours of the day during the months of July and August and shelled b[y the] women and children of the family. Where labor is employed to gather the alm[onds] it is usual for a squad composed of one man and three women working together to g[ather] about 20 arrobas, or 230 kilos (506 pounds), of almonds in the shell per day. T[he] women who usually do the shelling shell from 40 to 50 kilos of almonds, which pr[oduce] about 10 to 15 kilos of kernels.

)ne hundred kilos of almonds in the shell produce approximately 25 kilos of kernels. 'he wages paid to adult male laborers in this district are as follows: Expert peons, n who have some practical knowledge of agriculture and can be used as foremen, n 5 to 6 pesetas ($0.63 to $0.75) per day with quarters but no meals; ordinary labor,) to 4 pesetas ($0.44 to $0.50) per day without meals, or 2 pesetas ($0.25) per day found; women, 2.50 pesetas ($0.32) per day without meals; children (supposed to over 14 years of age), 1 to 1.50 pesetas ($0.13 to $0.19) per day. The women are ietimes paid by piecework for shelling. The rate is 4 pesetas ($0.50) per 100 kilos) pounds) of almonds in the shell.

'he legal number of hours constituting a day's work is eight, but the laborers here very deliberate and, excluding the time for meals, cigarettes, and frequent rests, y usually work about five hours a day.

'he almond shells are sold at from 4 to 5 pesetas ($0.50 to $0.63) per 100 kilos (220 inds) to village bakers to be used as fuel. The wages paid agricultural labor is ctically the same during the harvest as at other seasons. During the harvest the icultural laborer obtains more money, because the women and children of his ily are employed.

ccording to various producers one almond tree yields on an average of from 5 to 8 s (11 to 17.6 pounds) of almonds in the shell, depending upon the age of the tree l its size. These trees are usually planted from 140 to 220 per hectare (a hectare is 71 acres), or 56.7 to 89.1 trees per acre. These trees must be pruned and white-hed each year and the earth around them spaded. It is estimated that one expert n with a helper can prune and clean from 20 to 30 trees per day. The value of the d has been variously estimated by private individuals from 300 to 500 pesetas per tare ($15.32 to $25.55 per acre) for the bare land, and from 1,500 to 3,000 pesetas hectare ($76.64 to $153.40 per acre), with from 150 to 200 almond trees (60.7 to trees per acre).

The Spanish land bureau makes a lower estimate—250 pesetas per hectare ($12.77 r acre) for bare land and 1,000 pesetas ($51.08 per acre) for land with 140 bearing es (56.7 trees per acre).

)f the estimated 250,000 arrobas of shelled almonds brought each year from the erior to Malaga, about 85,000 are "Jordans" and the remainder "Valencias." is represents a total crop of 11,500 metric tons of almonds in the shell.

Due to the methods of cultivation and harvesting of this crop, it is almost impossible fix the cost of production. However, it has been variously estimated, taking in nsideration all overhead charges, taxes, interest on investment, exhaustion of soil, or, etc., that each arroba (11½ kilos) of shelled almonds costs the producer from 15 20 pesetas ($0.0748 to $0.0997) per pound.

The kernels are sold by the producer in bulk unassorted as to size.

The prices obtained for shelled almonds by the producers were as follows:

Jordans: 1919 crop, from 50 to 60 pesetas per arroba ($0.25 to $0.30 per pound); 20 crop, from 65 to 70 pesetas per arroba ($0.32 to $0.35 per pound).

Valencias: 1919 crop from 30 to 40 pesetas per arroba ($0.15 to $0.20 per pound); 20 crop, from 35 to 45 pesetas per arroba ($0.175 to $0.225 per pound).

It is impossible to give a correct estimate of the cost of living in Spain. This is espe-lly true in regard to the small agricultural proprietor and farm laborer. The former s made a great deal of money during the last years of the World War and the 18-nth period succeeding the armistice, due to the urgent demand for all his products top prices. But the farm laborer's earnings in Spain did not increase in proportion the ever-increasing cost of articles of prime necessity. Both classes always have en accustomed to a very low standard of living, scant and simple food, few clothes, d poor and insanitary living quarters. The small proprietor has, as a rule, improved farm somewhat with his own earnings and has possibly laid aside a few pesetas weather the succeeding reaction, but the farm laborer finds himself poorer and more contented than ever and endeavors to emigrate to America.

The average earnings of a farmer laborer aided by his wife and children are from 00 to 1,500 pesetas ($126.30 to $189.30) annually.

2. The exporters of Malaga who handle the almond crop consist of one principal m, which handles from 60 to 70 per cent of the crop, and an association of merchants, rmed to control prices, handles from 15 to 25 per cent, and the remainder is exported, a smaller scale, by the various exporters of Spanish products.

The price at which the almonds are purchased from the growers is practically fixed the exporters, but as in the latter years the crop has only been about equal to the mand the producers have been receiving very fair prices, and the exporters, having

the advantage of the premium on exchange on the moneys of the two countries ta[illegible] the greater portion of the crop, have also been very satisfied with their earnings.

The largest of the almond-exporting firms in Malaga employ from 400 to 600 w[illegible] during the almond season, which lasts from August 15 to November 15. This num[illegible] is exclusive of the number of employees packing raisins during practically the sa[illegible] epoch.

The women work by the day, of eight hours, and are paid as follows: Skill[illegible] sorters, 3 pesetas ($0.38); novices, 1.50 to 2 pesetas ($0.19 to $0.25).

An experienced assorter can usually assort 30 kilos of almond kernels per day.

The "Jordan" almonds are assorted exclusively by hand, as their elongate[illegible] renders it impossible to make even the primary operation of segregation accordi[illegible] size by mechanical means.

The "Valencias" are first passed through several perforated hoppers, each w[illegible] different sized perforations, which allow the various sizes of almonds to fall in[illegible] proper receptacle.

The almonds are then poured and spread on a wide movable belt or table sl[illegible] moving between two rows of expert women assorters, who quickly and accur[illegible] make a second and more perfect assortment of the kernels, picking out the va[illegible] larger sizes and dropping them in receptacles placed by their side.

The almonds are now properly assorted as to size and quality, they are then p[illegible] into revolving hollow drums to be cleaned and polished by rotary centrifugal f[illegible] Once cleaned and polished they are packed in wooden boxes lined with oiled pa[illegible] each box containing 28 pounds of shelled almonds, and once the box is strapp[illegible] stenciled it is ready for shipment.

The exporters estimate the actual labor, the cartage, and the cost of packing ma[illegible] at from 3.05 to 5 pesetas per box of 28 pounds of shelled almonds ($0.0137 to $[illegible] per pound). The overhead expenses are variously estimated by several expo[illegible] at 0.50 to 0.60 peseta per box ($0.00225 to $0.00270 per pound) and by others a[illegible] per cent on sales price of almonds.

From one of the exporters the following tabulation of assortment of almonds acc[illegible]ing to size and grades was obtained:

Jordans:	Per cent.
7 crowns (largest size)	3
6 crowns (next largest)	8
5 crowns (medium large)	15
4 crowns (medium)	25
3 crowns (medium small)	12
Gemellos (doubles)	9
Broken	3
Refuse	5
2 crowns (medium small)	20

Valencias:	Per c[illegible]
6 crowns (largest size)	[illegible]
5 crowns (next largest)	[illegible]
4 crowns (medium large)	[illegible]
3 crowns (medium)	[illegible]
2 crowns (small)	[illegible]
Gemellos (doubles)	[illegible]
Broken	[illegible]
Refuse	[illegible]

The almonds sold by the producers are, of course, unassorted and are sold by we[illegible] only, and it is the exporter who assorts, cleans, and packs them.

Exports of shelled almonds from Malaga, Spain, during the past five years

Year.	To all countries.		To the United [illegible]	
	Metric tons.	Pounds.	Pounds.	[illegible]
1916	2,063	4,546,852	2,873,338	[illegible]
1917	1,120	2,468,480	2,183,639	[illegible]
1918	2,116	4,663,664	2,982,597	[illegible]
1919	3,027	6,671,508	3,821,341	[illegible]
1920	2,281	5,027,324	2,821,075	[illegible]

The outlook for the 1921 crop is good.

Conversion to dollars made at 1 peseta = $0.1262, the rate prevailing on the [illegible] of this report, as recorded by the Federal Reserve Board.

ALMOND INDUSTRY IN VALENCIA CONSULAR DISTRICT.

[From Consul John R. Putnam, Valencia, Spain, July 6, 1921.]

Mr. Henry W. Carey, American consular agent at Alicante, has submitted the fol- lwing report concerning production conditions in the almond industry, covering ich information as he has been able to obtain. Mr. Carey is an important shipper f almonds.

An almond tree costs from the day it is planted until the day it produces—about ve years—approximately 20 pesetas.

Wages paid per day of eight hours are: Male, 5 pesetas; female, 2.50 pesetas; ildren, 2.50 pesetas.

Wages paid for different kinds of agricultural labor vary considerably, but what is nerally paid in the Alicante district is: Male, 9 pesetas; female, 4.50 pesetas; ildren, 4.50 pesetas.

Cost of living can be given at about 3 pesetas per day per person.

The value of bare land can be calculated at about 800 to 1,000 pesetas per hectaria 471 acres), and when planted to almonds at about 2,000 pesetas.

The prevailing method of shelling almonds is by hand, costing about 14 centimos r kilogram, 100 kilograms in shell give about 23 kilograms of kernels.

The principal varieties of almonds grown in the district are Planeta, Comuna, stana, and Marcona, the two first being grown in larger quantities.

Exhibit B.

Gross returns to growers in California.

Year.	Total pounds unshelled.	Returns to grower members.	
		Total amount.	Per pound.
14	2,261,250	$310,544.34	$0.1376
15	4,239,117	455,665.83	.1075
16	4,236,034	591,846.04	.1397
17	5,272,325	750,869.84	.1424
18	5,738,703	1,137,059.86	.1982
9 (estimated)	10,744,129	1,919,500.00	.1786
0 (estimated)	8,708,020	1,226,600.00	.1408
Average			.1551

These figures were secured directly from the books of the California Almond Growers cchange and can be verified to the last figure, with the exception of the crops for e years 1919 and 1920.

Unfortunately, the books have not been completely closed for the two last years ing to the inability of the exchange to sell their entire crop in competition with the eap almonds coming in from abroad. These figures, however, are based upon turns actually secured up to the present time on those which have been sold, adding those amounts the estimated returns on the balance of the crop on the basis of such les as have been recently made. Actually, growers have to date received only ents on Drakes and similar varieties, constituting over 65 per cent of the crop, and cents on Nonpareils and similar varieties (this for the 1920 crop).

Some varieties of almonds sold for higher prices than those indicated, and some sold lower prices. These represent, however, the actual returns on the almonds livered by the growers to the exchange and do not represent any costs such as ansportation, marketing, etc.

EXHIBIT C.

Comparative freight rates, American and trans-Atlantic.

To New York from—	Before the war.	During the war.	Present rates, July, 1919.	Quoted by—
Genoa	75 shillings per ton	No rate obtainable	180 shillings per ton	Pierce Bros. & Co.
Barcelona	$3 to $5 per ton	$45 per ton	$12 to $15 per ton	Manuel Diaz & Co.
Bilboa	do	do	do	Do.
Havre	No rate obtainable	No rate obtainable	120 francs per 2,204 pounds.	French Line.
Bordeaux	$18 per ton	$5.50 per 100 pounds.	60 cents per cubic foot, or $1.25 per 100 pounds.	Cosmopolitan Steamship Corporation.
Marseille	No rate obtainable	No rate obtainable	130 francs per 1,000 kilos.	Fabre Line.

Many ships carry almonds as ballast on the western trip for almost nothing, bare[illegible] sufficient to pay the loading and unloading charges.

Freight rates from California to all points east of Denver, in carload lots, per 1[illegible] pounds: Unshelled, $2.40½; shelled (in boxes), $3.00¾; shelled (in bags), $4.51¼.

These figures represent a very actual part of the cost of marketing almonds fro[illegible] California. They are not figured, however, in the difference in the cost of productio[illegible] between California and Europe, nor are they used as a basis for requesting a readju[illegible]ment of the tariff rate as indicated.

It is evident that the proposed tariff rate is justified even without the considera[illegible] of this important factor.

EXHIBIT D.

Old World production.

[The best available statistics concerning European production are those of Don Manuel Vines de C[illegible] professer "La Escuela Superior de Comercio de Baleares."]

	Metric tons.		Metric tons.

1910	3,300	6,600,000			

EXHIBIT E.

ESTIMATED ACREAGE IN CALIFORNIA.

Acreage in California almonds at the present time is estimated at well over 100,000, f which over 50,000 acres have never borne any nuts.

That acreage which has reached commercial bearing is in all probability at the resent time not more than 35,000, and probably less. It is evident, therefore, that roduction within the next few years will reach at least 30,000,000 pounds, and probly much more.

This increase in acreage is due to the stabilization of marketing competition, owing the formation of the California Almond Growers Exchange, coupled with the straordinary demand due to the unprecedented prosperity accompanying the war eriod.

Practically all of the increased plantings have been made since 1910, and no noticeable increase in tonnage was secured until after 1915. With highly stimulated markets e gradual increase in production was not difficult to market in the shell before the ose of the holiday season. With a reasonably good market thousands of people roughout the United States have invested in almond orchards in the West, as have any California growers. Unfortunately, perhaps, the average man who invests in almond orchard or who plants an orchard does not understand all the factors that ay make the industry profitable or unprofitable in the future. He looks at the past d compares it with the present, as far as his data may permit him to do so, and if looks good he figures it will continue to get better, so he proceeds to plant. Perhaps is fortunate that he does so, for if he did not there would be no new industries in is country to protect, except such as were fortunate enough to have no competition om outside.

EXHIBIT F.

SHELLING PERCENTAGES.

The following record of Government tests of shelling percentages of California nonds explains itself and shows that a given weight of whole nuts will yield less an 33 per cent kernels:

Cracking tests by machine method of 12 leading commercial almond varieties.

Variety.	Nuts put through cracking machine.	Weight of kernels, whole and broken, actually obtained.	Kernels (whole and broken) actually obtained.	Weight of nuts in sample which did not crack.	Weight of kernels of nuts not cracked, computed on column 3.	Added for kernels in nuts which did not crack.	Total kernels, including nuts which did not crack in machine.

Texas Prolific	4.51	3.14	24.24	54.25	2.20	[illegible]
Average domestic	5.74	3.31	23.72	53.49	2.56	[illegible]

[1] Only shelled nuts received.

The data presented is interesting in showing that there is no material differe[illegible] nutritionally between the domestic almond and the imported article.

The water percentage of the imported article is lower than that yielded by t[illegible] home product, but it may be that the former was somewhat dried out before [illegible] received the sample, inasmuch as said samples consisted only of the kernel, wh[illegible] the domestic product was furnished in the shell, and therefore any loss by evapora[illegible]tion of moisture in the kernel was prevented.

There is practically no difference between the average percentage of ash in [illegible] foreign and domestic. The difference between the two averages is 0.2 of 1 per [illegible] The maximum registered for the foreign is 3.34, while the maximum registered [illegible] the California is 3.74; the minimum percentage for the foreign is 3 and for the dom[illegible] 3.01 per cent.

The protein content differs more than any other, and the difference is decid[illegible] in favor of the California article, in that the average protein for the foreign is [illegible] per cent, with a maximum of 22.40 per cent and a minimum of 20.57 per cent [illegible] corresponding figures for the home product are: Average, 23.7 per cent; maxim[illegible] 26.78 per cent; minimum, 20.22 per cent. It will be noticed that the average f[illegible] California rates more than 2 per cent higher than for the foreign.

The nitrogen free extract is represented by a higher percentage in the case [illegible] foreign nut than in the domestic. As the amount of starch in the almond is [illegible] and the availability of other nitrogen free extract compounds is not as great a[illegible] starch, the lower percentage noted for the domestic article is really an advanta[illegible]

The caloric value is almost identical, being 2,860 for the foreign almonds as [illegible] 2,800 for the domestic.

It must also be remembered that we are averaging the analyses of 5 variet[illegible] foreign almonds while we are averaging 14 varieties of California almonds.

It is true that there is a slight difference in the average fat content in fav[illegible] foreign nut, but an examination of the individual varieties or kinds shows th[illegible] general run of both domestic and foreign are about the same. In fact, the [illegible]mestic varieties that are below the general run are the two varieties that were [illegible]nally brought here from Spain and France, viz, Jordan and Languedoc. [illegible] out of line with the general average are thrown out, the average fat content is in [illegible] of the domestic almonds.

The Bank of Esparto,
Esparto, Calif., July 6, 19[2]...

Mr. T. C. Tucker,
Manager California Almond Growers' Exchange.

Dear Sir: I have before me yours of June 29, and in reply beg to say tha[t] ... attitude of the Bank of Esparto is just as it has been from the start—perfectly ... and ready to do anything we can for the almond growers in our section and the as[so]ciation or exchange that is in our power. But owing to the shortage of crops and ... price of products of every kind and the failure on the part of the various excha[nges] and associations operating in this section, we find a difference in deposits betw[een] the highest and lowest levels during the year of more than $216,000 in the little ... of Esparto.

Is there any wonder that we have reached the limit? We have been trying to ... help from the associations and exchanges all this time, and just hanging on b[y the] "skin of our teeth," hoping they would make payments to the farmers that would ... us relief; but instead of advances in money some of them paid them in notes ... expected the bank, that was carrying all the load that it could possibly carry, to [con]tinue to put up when the limit of human endurance had been reached. It t[ook] three weeks to get rid of these notes, and only then by our becoming responsib[le] to the having them charged back to us when they were due. Our borrowing li[mit] has long since been reached, and we are now only existing through the leniency of ... superintendent of banks, with a limit on that privilege. When we borrow mon[ey we] have to have a limit on it, and it has to be met when due. When the farmer com[es to] us for money, and we ask him when he can meet it, he is up against it and can ... say, "I hope to be able to meet it some time in the 'Sweet by and by.'" The[n we] give him the money if we have it and wait and wait as we are still waiting for the ... end of the 1919–20 crops, with the expense of harvesting another staring us in the f[ace] with no promise as to when relief will come.

Then we are asked what out attitude is regarding advances to farmers. Our ... crops in this section are almonds and barley, and when they fail we are simpl[y] ... against it. No one can say that the almond crop, both as to yield and price as ... up to the present time, was not a failure. No one can realize more than the ... what everyone interested in the marketing of farm products has been up aga[inst] ... and I have not entered a complaint but, as a matter of fact, have talked and ...

ıny a man in line that would have otherwise drawn out in disgust. We would ıdly advance the farmer more money if we could, but it simply is not here to adnce. They are beginning to come to us now and ask where they are going to get ›ney to harvest. What can we tell them? We have no money to advance. If ur association could deposit in our bank the amount to meet the needs of the growers, would be only too glad to distribute it around where it was most needed.

We have a fair barley crop, and if the farmer would sell it would give us temporary ief, but it is worth only about a cent a pound, and when it cost him about that one n hardly expect him to sell just now.

Trusting you may see our position and not leave the impression that the local bank uld and should take care of his wants. We have many notes in our pouch that ould have been met and was promised out of 1919 and 1920 crops, with nothing finite as to their payments.

If you have any solution of the problem and can assist us as well as the farmers, we uld like to hear from you.

Very truly, yours,

M. O. WYATT, *President.*

EXHIBIT L.

SENATE JOINT RESOLUTION NO. 24 OF THE LEGISLATURE OF CALIFORNIA.

Whereas, The production of almonds constitute one of the basic industries of the ate of California, which State has demonstrated that she is capable of producing monds in sufficient quantities to meet all the demands of the United States;

Whereas, In order to properly protect this industry a tariff on almonds, which are incipally imported from the cheap labor sections of Europe, Asia, and Africa, is cessary if this industry shall not perish;

Whereas, The present tariff on almonds is wholly inadequate for such protection: ow, therefore, be it

Resolved by the senate and assembly, jointly, That the Legislature of the State of lifornia hereby memorializes Congress to provide such a tariff on imported almonds will equalize the cost of production and marketing between the home grown and ported product; and be it further

Resolved, That California's Senators and Representatives in Congress be, and they e hereby, urged to use all honorable means to secure the adoption of such a tariff; d be it further

Resolved, That the secretary of the senate be, and she is hereby, instructed to rward copies of these resolutions to the Secretary of the Senate of the United States, each member of the Committee on Ways and Means of the House of Representatives, each member of the United States Tariff Commission, and to each of California's enators and Representatives in Congress.

C. C. YOUNG, *President of the Senate.*
HENRY W. WRIGHT, *Speaker of the Assembly.*

Attest:

FRANK C. JORDAN, *Secretary of State.*
By FRANK H. CORY, *Deputy.*

ALMONDS, FILBERTS, AND WALNUTS.

[Paragraphs 754, 755, and 758.]

TATEMENT OF G. W. R. WALLACE, CHICAGO, ILL., REPRESENTING THE ASSOCIATED SHELLED NUT INTERESTS.

Mr. WALLACE. I represent the associated shelled nut interests, ith headquarters at Chicago, and will ask permission to file a brief ith some memoranda within the next few days. I shall only now ccupy two or three minutes to bring out some points.

Senator MCCUMBER. Very well.

Mr. WALLACE. We are asking that the rates of duty on almonds, oth unshelled and shelled, shall be for the unshelled 3 cents a pound nd for the shelled 6 cents a pound.

The reason for that request is this: We are not opposed to th protective theory, especially where, as with peanuts, the imported nut and the domestic nut are alike in character; but where there is a difference in character and where the character of the article is suitable for particular purposes, then we believe that any duty that should originate with your committee should be merely for revenue.

Shelled almonds are used almost entirely by manufacturing confectioners and bakers. There is, of course, a small sale in the retail confectionery stores, but the great majority of them are used in the manufacture of confectionery of different sorts and by bakers.

The California almond is not and will not be used by the manufacturing confectioner for one very good reason, and that reason is that the California almond does not have the almond flavor and its fiber, its construction, is too woody to permit it to be used in the manufacture of confectionery.

These attributes of flavor and structure in the imported almond are suitable in an unusual degree for the purpose of manufacturing confectionery and for bakers.

The rate of duty on the shelled almond should not be so high as to exclude the shelled almond, and it may be so high that it would exclude it, because the confectioner realizes, as well as the baker, that there is a limit to the price that he can get for his product, and as one of my predecessors here said, any little bit added always makes a little bit more, and it would be impossible for him to sell his product if the rate of duty was so high that the imported nut could not come in; and he could not and would not use the American nut for the same purpose.

The rate of duty asked on the unshelled nut we are not particularly interested in, because the American nut unshelled brings more in the American market than the imported nut; and the imported nut unshelled, especially almonds and walnuts, forms a very small proportion of the total amount imported. They are mostly imported shelled.

This is true of the walnuts, also, and more especially is it true because the California walnut is the best walnut that is grown anywhere in the world. There is no walnut that can compete with it. They can get such a price for it in the shell that it would not pay them to take the shell off and sell it as a shelled walnut.

The imported nut is not as good. It has not as soft a shell. It would not be as easy for you and me to sit at a table, as we can with the California nut, and crack them in our hands.

Senator DILLINGHAM. You say that the California walnut is superior to all others, and the almond is not?

Mr. WALLACE. Yes, sir; it is just the reverse of the almond. The reason for the shelled walnut being imported is because they are inferior nuts and can be shelled at a price which the confectioners can pay and use the shelled walnut.

In regard to the proportion in the rates between the unshelled and the shelled, I remember reading, when the bill was introduced in the House, that the Tariff Commission had found that, scientifically, there were approximately 3 pounds of unshelled nuts used to make 1 pound of nut meats; and then in some of their calculations in the hearings before the Ways and Means Committee they used 3 pounds, and in some others they used 4 pounds and in one other

ulating their output, they tabulated the shelled at 50 per cent. I do not really know exactly whether three to one or two to one uld be absolutely accurate. But if you will look at the prices at ich these nuts, unshelled, are sold and the prices at which the lled nuts are sold, you will find that the ratio should be nearer to one than three to one.

fter all, they are really separated, so that while I do not pretend be a scientist myself in that regard, I have had some experience h five different tariff laws, and I think it has been shown in the t that the specific rate ascertained and put in the law has been nded not on some scientific thing, but on the value that the helled nut represents and the value that the shelled nut represents. have figured on the percentage of duty that you wanted and have made a specific rate.

he Payne-Aldrich tariff bill had on almonds 4 cents a pound, helled, and 6 cents a pound on the shelled. So far as the unled are concerned, we do not care really whether you put it at r 4 cents. It will make very little difference. There is only a small proportion of almonds or walnuts that are imported in the l, anyhow, and the domestic producers of unshelled almonds get good a price, with the exception of one brand of imported, as is ived on the imported goods. That one brand, the Jordan ond, is not sold to any very appreciable extent in the shell. s sold practically exclusively shelled. It comes in boxes 28 nds to the box and is used in the higher class of trade.

he smaller Sicily almond has the flavor and the texture, but has the appearance—and after all, we Americans look at the appearance when we are buying something. It can be and is used in making ond paste, to which it gives the almond flavor and the softness the desirability in taste and in feeling in your mouth that the ond paste must have.

ith your permission I will file a brief later, and I thank you for r courtesy.

EF OF G. W. R. WALLACE, REPRESENTING THE ASSOCIATED SHELLED NUT INTERESTS.

SHELLED ALMONDS.

s well established that the domestic almond is not suitable for use in the manufac- f confectionery and in the production of bakery goods for natural reasons, and the mption of shelled almonds by these industries forms practically the entire et therefor. The imported almond, on the other hand, has both the almond r and the structure required.

e sale of unshelled almonds for general consumption is largely controlled by the stic producers, and takes so large a part of that production that the limited nd for domestic shelled almonds is supplied by the shelling of culls and nuts wise undesirable for sale in the shell.

read on page 1969 of the hearings before the Ways and Means Committee, Part Schedule F, Schedule G, and Schedule H, a statement by Mr. G. W. Pierce to the that the almond industry has developed four or five hundredfold in the last 10 That is three years under the Payne-Aldrich tariff law, act of 1909, with duty ents per pound and 6 cents per pound on the unshelled and shelled almonds, and years under the existing law, with its 3 cents and 4 cents per pound duty, inng a year or two war period of some diminished foreign competition; and yet, in of the vast increase in the domestic almond industry, only about one-half of 1 ent of the domestic crop has been sold shelled. (Statement of Mr. T. C. Tucker, 1971, hearings before the Ways and Means Committee.) It can only be true that atural characteristics of the domestic almond, rendering it unfit for manufacturing

purposes, prevented a much larger proportion of the domestic almond being sold
used by manufacturers.

No rate of duty that could be devised would render the domestic almond suita
for manufacturing purposes, and therefore an excessive rate would only result in
restriction of the use of the shelled almond and would not materially enhance
market for the domestic shelled almond.

The market quotations demonstrate that the domestic shelled almond is offered
sale at less than the imported almond, and yet there is only a fraction of 1 per cent
the domestic production sold shelled. The following prices are taken from the
York Journal of Commerce, page 12, issue of August 31, 1921:

Imported:		California:	
Valencia	35@36	Nonpareils (medium size)	
Jordan	58@75	IXL	
Alicante	37@48	Dipping	
		Drakes (medium size)	

The unshelled almonds sold as follows on the same date, August 31, 1921:

Imported:		California:	
Cartagena	16½	I X L	
Tarragona	17	Ne Plus Ultra	[illegible]
Ivica	13	Nonpareil	
French, hard shell	9@9½	Languedoc	
		Drakes	

It will be observed that the California almond, unshelled, brought prices rang
from 16 cents per pound to 27 cents per pound, while the imported unshelled almo
were sold for prices ranging from 9 cents to 17 cents per pound. Under conditi
like these the great increase in the domestic almond industry took place, an
almond was produced that seemed to have found a ready market, in the shell,
that protection by high rates of duty has not been found necessary. Any
duty, therefore, that is provided would of necessity be for revenue. The mem
of this association are for the most part interested in the greater development
market for almonds, whether domestic or imported, as their business is in part
buying and selling of almonds, and the larger the demand the greater their bus
and they are naturally opposed to anything that will serve to lessen demand or
the market. They believe that any rate of duty higher than has heretofore ex
either on the shelled or unshelled almonds, will inevitably lessen the deman
therefore restrict the market.

SHELLED WALNUTS.

Much that has been said above as to almonds is equally true of walnuts.
domestic walnut, as has been said, is the best that is grown, but the selling p
the walnut in the shell is so favorable that there is little, if any, advantage in sh
for the market. The imported shelled walnut is one which could not be sold in
petition with the domestic walnut if in the shell and is therefore worth less th
domestic walnut unshelled. These imported shelled walnuts are of good fla
structure and readily adapted to manufacturing confectionery, etc.

The increase in the domestic production and sale of walnuts seems to have
paralleled that of the almond industry, as from an output of 9,600 tons in 191
of over 28,000 tons in 1919 an increase of over three hundredfold is shown.
other hand, while the imported walnut shows an increase in actual quantity imp
yet the proportion of imported walnuts to the total of sales in the United
shows a reduction. For example, in 1910 the domestic production was less th
importation, but in 1919 the domestic production and sales were 28,100 tons
perad with 22,391 tons, an excess of approximately 6,000 tons in favor of the d
producer. It is difficult to understand, therefore, just why any additional prote
needed or desirable under circumstances such as these. At the prices pre
however, the demand gives evidence of being curtailed, and unless prices
reduced rather than advanced a still further lessening of demand will occur.
domestic production would not be benefited by any materially increased
duty, as a lessening demand naturally results in a restricted market; and as t
mestic producer, under present conditions, is able to dispose of all he prod
attractive prices, we are therefore convinced that the rates of duty at present
vailing, viz, 2 cents per pound for unshelled walnuts and 4 cents per pound on
walnuts—or not to exceed the rates in the act of 1909, viz, 2½ cents on unshell
5 cents on shelled walnuts—should be incorporated in the forthcoming tariff

[S]TATEMENT OF E. B. HUTCHINSON, MONTCLAIR, N. J., REPRESENTING DRIED FRUIT ASSOCIATION OF NEW YORK.

[M]r. HUTCHINSON. I live in Montclair, N. J. I am manager of shelled nuts and confectioners' supply department of Birdsong [Bro]s., New York City, and I am representing the Dried Fruit Asso[ciat]ion of New York with reference to paragraphs 754, 755, and 758, [refe]rring to almonds, filberts, and walnuts, both shelled and un[shel]led, and I am here particularly to protest against the enormous [rate]s of duty advocated before you gentlemen by the California [gro]wers.

[Se]nator SMOOT. Are you interested in dried fruit?

[M]r. HUTCHINSON. No, sir. That was an error in the schedule. [I ju]st want to point out, with reference to these demands of Cali[forn]ia, that under their own showing they have sold 60 per cent of [the] total quantity of almonds in the shell that were marketed in [this] country, and have also sold and marketed 70 per cent of the [walr]nuts in the shell that were marketed in this country. In con[nect]ion with their request for further increases of duty I want to [refer] to the testimony given by Mr. Tucker before the Ways and [Mea]ns Committee, as shown on page 1908 of the record. In answer [to a] question he said:

> [In] normal times paper-shell almonds brought 35 cents a pound in the shell, 25 [cents] per pound for the seedling variety, which represents the major portion of our [crop]. The average last year, during the war and war conditions, was about 47 cents [a pou]nd for paper shell and 35 cents a pound for seddlings.

[La]ter on Mr. Tucker testified with reference to the cost of pro[duci]ng almonds, as shown on page 1909 of the record, as follows:

> [Th]e University of California gave their estimate of the cost of producing the 1920 [crop a]t approximately 16 cents per pound in the shell.

[Be]tween 16 cents per pound and his statements of 35 and 47 [cent]s there is an enormous profit somewhere, and I submit that [the] argument for enormously increased duties is unwarranted.

[Th]is is a long subject, and I have a brief which I will ask permis[sion] to submit. What I want to do is to call a few salient points [to y]our attention.

[To] show the greediness of California in contending for this largely [incre]ased duty on a product which up to the present they are not [able] to produce—I refer to shelled almonds and shelled walnuts—[the g]rowers ask for a duty of 12 cents per pound on shelled walnuts [and] 15 cents per pound on shelled almonds. These goods are en[tirel]y different in character from the nuts in the shell and are sold [to a]n entirely different trade.

[Se]nator McCUMBER. You say they do not raise the shelled wal[nuts] commercially?

[Mr]. HUTCHINSON. For the purposes I have mentioned they are [not] known commercially. The shelled almonds they produced [last] year, under Mr. Tucker's own statement, was one-half of 1 per [cent] of the crop.

[Se]nator McCUMBER. Maybe I misunderstood you. You mean the [shell]ed product?

[Mr]. HUTCHINSON. Yes, I am speaking of the shelled product.

[Se]nator McCUMBER. Not the entire production?

Mr. HUTCHINSON. No, not the entire production. The po[illegible] I want to bring out is that these shelled goods are practically [illegible] raw material of bakers, manufacturing confectioners, almond pa[illegible] manufacturers, bread and cake bakers, biscuit and cracker man[illegible] facturers, blanchers, salters, and similar industries, just as m[illegible] raw material to them as flour or sugar, because it enters into [illegible] product in combination with those articles.

In regard to almonds, the manufacturering confectioners [illegible] their allied industries that I have mentioned have in the past [illegible] deavored to use California almonds, but they found they could [illegible] get a good product, one suitable to the trade, and the reason [illegible] that they found the California almonds were fibrous and lacking flavor. I have the authority of Mr. Henry Heide, of New York, w[illegible] is a large manufacturer of almond paste, as well as confection[illegible] to state that his company some time ago bought a quantity of [illegible] fornia almonds for the purpose of making a thorough test, and [illegible] had to sell on the market the majority of what he bought, and w[illegible] he did use he could only do so in conjunction with 90 per cen[illegible] the foreign imported almonds.

Now, gentlemen, the point that I want to bring up to you is [illegible] to produce 1 pound of shelled almonds it is necessary to have [illegible] pounds of almonds in the shell. California sold practically all [illegible] almonds in the shell last year. There were between ten [illegible] eleven million pounds. The importation of shelled almonds [illegible] 27,543,521 pounds. In order to arrive at a determination of [illegible] comparative volume with the California product it is necessar[illegible] multiply that by three. Therefore we get a result of importa[illegible] of shelled almonds, but in terms of almonds in the shell, of 82,63[illegible] pounds. In other words, there were eight times the quanti[illegible] shelled almonds imported as California produced last year; they [illegible] now asking you to put a duty of 15 cents a pound on these she[illegible] almonds when they can not produce them. They might be able [illegible] produce them in 7 to 10 years if they would plant trees now. [illegible] would think it doubtful whether they could produce any such qu[illegible] tity. Where are they going to get the capital to-day to plant [illegible] trees for that quantity? On the surface it is plain that their [illegible] mands are absurd. It looks like the fable of the "fox and the grap[illegible] There is a big trade here, and they can't get it. They haven't [illegible] quality or the quantity. Yet they want it, and so they want to m[illegible] the consumer, the people of the United States, pay a big incre[illegible] duty simply to satisfy their spleen.

I am not going to talk further on almonds. Yes; there [illegible] other point I want to mention. In the shelled almonds it is ne[illegible] sary for importers to go to the various countries of the world [illegible] course, we get them from Europe, but we do not get almonds of [illegible] same type, quality, and description from every place. We have [illegible] to Andalusia, Spain, for a certain almond, the sweetest almond kn[illegible] used for table purposes. They are known as the Jordan al[illegible] There is no such thing as the Jordan almond grown in Calif[illegible] We have to go to the Alicante district of Spain for a certain alm[illegible] used very largely in confectionery. We have to go to the dis[illegible] Valencia for the Valencia almonds; and to Majorca for the Ma[illegible] almonds. The almonds used in the manufacture of chocolate [illegible]

rs come from the Island of Majorca. The Beraude almonds are gely used for table use and for blanching and salting, and are proced in the Province of Provence, France. Then the Avola almonds ed by manufacturing confectioners are produced in the Island of ily. They are used for salting and small sizes for chocolate coat. The Aetna almonds also come from Sicily, and are used by unufacturing confectioners. The Palma and Girghenti almonds o come from Sicily, and are used by bakeries, confectioners, and ocolate-almond bar manufacturers. The Bari almonds come from Puglia district of Italy and are similar to the Palma and Girenti almonds. The Cretan almonds are produced on the Island of ete, a Grecian island. The Canary almonds come from the Portuese Canary Islands. Each grade has its own particular use. Each of them is distinct. You can not obtain one grade except in that ticular place. You can not go to Italy and get the Jordan alnds, and you can not go to Spain and get the Palma and Girnti or the Aetna or the Bari or the Avola almonds.

This, for 20 years, has been a highly technical business. We porters have had to know just what our customers' requirements re. They often did not know where to go themselves for these nonds, and we have had to seek them in these countries I have ntioned. We did not find them in California. If they are there, have no prejudice against California. It is an American State, l we are Americans, and we do not want to go abroad if we can get m in this country.

Senator McLEAN. When was that statement made as to the cost of ing almonds in California?

Mr. HUTCHINSON. That is on page 1909 of the record before the ys and Means Committee. It says:

he University of California gave their estimate of the cost of producing their 1920 at approximately 16 cents per pound in the shell.

Senator McLEAN. 1920?

Mr. HUTCHINSON. 1920. That is Mr. Tucker's testimony. I do know what date the statement was issued.

Senator McCUMBER. Your time is up. I would suggest you make ir statement as brief as you can.

Mr. HUTCHINSON. I would like to say a few words in regard to nuts, and then, if you will permit me, I will file this brief, which es it in detail.

Senator McCUMBER. Very well.

Mr. HUTCHINSON. In shelled walnuts the importations were about 00,000 pounds. That was in the year 1920. It is necessary to 4 pounds in the shell to produce 1 pound of shelled walnuts. it makes a total of 80,000,000 pounds of walnuts in the shell. latest statistics indicate that California produced in 1919, the y year I could gather statistics for, 56,496,000 pounds. That clusively shows that for these manufacturing purposes, California ld not commence to supply the need. Now, California asks a y of 12 cents a pound on these shelled walnuts, and they can not ply the quantity, even if they could supply the quality, which y can not do. They claim they can, but the manufacturers, who w better than I do, tell me they can not obtain the same results n the California goods. I am going to leave now the subject of nuts.

On shelled filberts, there are none grown here commercially. In fact, they do not enter as a factor at all.

Therefore, the only question for you to consider, gentlemen, in placing the rate of duty, is what will bring the greatest revenue from them. The recommendation of the committee of the dried fruit association on the duties in these various paragraphs are as follows:

In paragraph 754, almonds—almonds in the shell 4 cents per pound, shelled almonds 6 cents; paragraph 755, filberts—filberts in the shell 3 cents per pound, shelled filberts 6 cents; paragraph 758, walnuts—walnuts in the shell 3 cents per pound, shelled walnuts 6 cents.

These figures will give almost a 50 per cent increase over and above the present rates, and are practically the same as those contained in the Payne-Aldrich bill. I don't think they will interfere with the volume of the importations. Therefore, they will not affect the Treasury receipts. In fact, they will enhance the Treasury receipts by the amount of this 50 per cent. What I wish to point out is that excessive rates of duty will undoubtedly tend to lower importations and will decrease revenues to the United States.

BRIEF OF E. B. HUTCHINSON, REPRESENTING THE DRIED FRUIT ASSOCIATION OF NEW YORK.

ALMONDS.

The quantity of almonds produced in California in the year 1918, as shown page 1954, Tariff Information, 1921, Bulletin No. 17, was 10,200,000 pounds. The importation of almonds during the year 1919, as shown by the United States Bureau of Statistics of Imports, was 27,543,521 pounds shelled almonds, and 7,482,538 pounds unshelled almonds. As a method of comparison it is necessary to arrive at a figure as denominated under the term of "almonds in the shell," and for this purpose we multiply the quotation of shelled almonds by 3 (on the ratio of 3 pounds almonds in the shell to produce 1 pound of shelled almonds), which gives us a total of 82,636;563 pounds, to which add the importations of almonds in the shell, 7,482,538 pounds, giving a grand total of importations of 90,119,101 pounds, based on the denomination of "almonds in the shell."

This indicates that there was imported into this country at least eight times the quantity of almonds that were produced in California in the year 1918, consequently the consumers of the United States, if an increased duty was imposed, would be subjected to heavily increased prices for their raw materials and simply for the benefit of a few comparatively small producers in California.

In addition, the larger consumption (over 90 per cent) of shelled almonds is by consumers east of the Mississippi River.

These shelled almonds are used mainly by manufacturing confectioners, chocolate manufacturers, almond-paste manufacturers, bread and cake bakers, biscuit and cracker manufacturers, blanchers, salters, and similar industries, and, due to the variety of their products, they need a very large variety of these goods, varieties which are only obtainable in certain countries and which have not been produced in California and from experiments which have been made it appears it would be impossible to produce in that State: For instance:

Jordan.—There are about 1,500,000 pounds of this grade imported annually into the United States, and they are used chiefly for table purposes (being known as the best flavored almonds grown), also for blanching and salting, and also by confectioners for the manufacture of what is known as "sugar-coated Jordan almonds." These almonds are grown in the Province of Andalusia, in Spain, and it has been impossible to produce them elsewhere.

Alicante.—There are about 2,000,000 pounds of this grade imported annually into the United States and they are used chiefly in the manufacture of candies and confectionery, for chocolate coating. The largest sizes are also used for blanching, roasting, salting, etc. These are grown in the Province of Alicante, in Spain, and can not be produced elsewhere.

Valencia.—There are about 3,500,000 pounds of this grade imported annually into the United States. These almonds are used principally in the grocery trade, which sells them to the general public for the making of almond cakes. They are especially

large demand by the Hebrews, with whom it has been a custom to make such s for their various religious holidays. They are produced in and near Valencia, in.

ajorca.—There are about 2,000,000 pounds of this grade imported annually into United States. They are mainly used by the manufacturers of chocolate-almond , which is a well-known, very large industry. They are produced in the Balearic nds.

raude.—There are about 75,000 pounds of these almonds imported annually into United States. They are used chiefly for table use, and also for blanching and ng, and are produced in the Province of Provence, France.

rola.—There are about 700,000 pounds of this grade imported annually into the ed States. These are used mainly by manufacturing confectioners for chocolate ing. The larger sizes are also used for blanching and salting and are in particu- good favor for this purpose, because of their flatness, and, also, the skins being render them easily blanched. They are produced in the island of Sicily.

ma.—There are about 2,000,000 pounds of this grade imported annually into the ed States. They are chiefly used by the manufacturing confectioners for choc- coating and chocolate dipping, and also for topping, the larger sizes also for ching and salting. These are likewise produced in the island of Sicily.

lma and Girghenti.—There are about 4,000,000 pounds of this grade imported ally into the United States. These almonds are used chiefly by manufacturers ocolate-almond bars and by manufacturing confectioners and biscuit manufac- s, also by bakers, and they are also retailed through the grocers to the consuming ic. These are also produced in the island of Sicily.

ri.—There are about 7,000,000 pounds of this grade imported annually into the ed States. They are used chiefly by manufacturers of chocolate-almond bars, by cake bakers and bread bakers. They are produced in the Puglia district of

tan.—There are about 500,000 pounds of this grade imported annually into the ed States. They are used largely by manufacturing confectioners and also by rs and allied industries. They are a product of the island of Crete (Greece).

nary.—There are about 1,000,000 pounds of this grade imported annually into nited States. They are used by manufacturing confectioners and bakers. They rown in the Canary Islands (Portuguese).

ere are also a large number of almonds produced in other countries than those named.

is a well-established fact that these various varieties can not be produced in rnia, and it is well known that the California product is of a fibrous nature and ng in flavor, and they have been trying to produce shelled almonds for commer- urposes for the last 25 years, but without success to the present time, and for eason manufacturers of confectionery and cakes have found it impossible to use their business.

the argument submitted by the California growers they have claimed additional ction, so that the present uncultivated lands in that State may be utilized for rowth of almond trees, and they claim that such trees would commence to bear n from two to three years. This has been positively contradicted by experience, has shown that almond trees do not bear fruit before they are at least of five ven years' growth. We urge, therefore, that it would be a burden to a very number of consumers in the United States, which is practically the entire general c, if additional import duties be imposed.

Californians also mention the amount of capital invested in their almond rds and approximate the same as $50,000,000 and the number of persons em- d as 50,000 during the harvest season, which is presumably not more than two s, and 5,000 for the remainder of the year. This is stated on page 2004 of the ony given by Mr. Pierce before the Ways and Means Committee.

against this investment, we would point out that the manufacturing confec- s and chocolate manufacturers have an estimated capital invested in their sses to the amount of $250,000,000 and employ 120,000 people all the year . These figures do not include about 75,000 small retailers, very many of manufacture candy in a small way and employ from two to five people in each The baking industry has a capital of about $500,000,000 and employs about 0 people all the year round. The biscuit and cracker manufacturers have an ed capital of about $100,000,000 and employ about 50,000 people all the year

We now beg to refer to the testimony given before the Ways and Means Comm on January 25, 1921, "Tariff Information, 1921, Bulletin No. 17," by Mr. T. C. Tu representing the California Almond Growers Exchange.

On page 1907 Mr. Tucker stated that he represented about 85 per cent of the We presume he meant of the California growers. He furthermore stated that th in California in 1920 was about 5,500 tons; that is, equal to about 11,000,000 p in the shell.

We submit to the committee that the importations of almonds during the yea were 90,119,110 pounds, as shown by the United States Statistical Department indicates that there was imported into this country in the year 1920 at leas times the quantity of almonds that was produced in California in the sam We therefore call to the committee's attention that, inasmuch as California pro only one-ninth of the amount of almonds consumed in this country, it would n right that the large number of consumers of these goods should be penalized b imposition of a very heavy additional import duty.

We furthermore submit that if the additional duties are imposed, it will result very large decrease in the quantity of almonds which will be imported, and as a sequence, the United States Treasury will not receive the equivalent in duties th expected if Congress anticipates that imports will continue as before.

In connection with this subject, we would also mention that in our opini resultant decrease in the importation would have a tendency to place out of em ment a very large number of people who now are employed in the confectioner baking and allied trades.

Furthermore, the witnesses for the California Almond Growers' Associatio tried to convey the impression to Congress that the imposition of an addition would not affect the cost of almonds to the consumer.

This is absurd, in view of the testimony given by Mr. Tucker and shown 1908 as follows:

"In normal times paper-shell almonds brought 35 cents a pound in the she cents per pound for the seedling variety, which represent the major portion crop. The average last year, during the war and war conditions, was about 47 c pound for paper-shell and 35 cents a pound for seedlings."

At the ratio, which they state is 3 pounds of almonds in the shell to produce 1 p of shelled almonds, the price of shelled almonds to the California growers wou three times the above; in other words, from 75 cents to $1.05 per pound in n times, and, on the basis of the prices that obtained last year, it would be from per pound to $1.41 per pound for shelled almonds.

The average price of imported shelled almonds to the manufacturing ind which use them was, last year, not more than 30 cents per pound.

The question is raised whether it is wise to impose this additional cost upon th sumption of food products, of which almonds constitute an important part, and as to whether this increase would not lead to practical substitution, and conseq the elimination of almonds from a large part of bakery and confectionery pr

With further reference to the prices obtained for the California almonds in th as above mentioned, we beg to refer to page 1909, in which Mr. Tucker stated

"The University of California gave their estimate of the cost of producing th crop at approximately 16 cents per pound in the shell."

It is very evident that if the goods were sold to consumers at from 35 cents per to 47 cents per pound, there was an enormous profit to the growers, and they not need any further protection.

On page 1908 Mr. Tucker testified:

"We have sold a few shelled almonds on the Pacific coast, our sales being pr one-half of 1 per cent of our total cost." (A typographical error, as it probabl "crop.")

On page 2005 Mr. Pierce stated in his testimony:

"The present existing law has put us out of the shelled-almond business."

It is evident from Mr. Tucker's testimony that to all intents and purposes th fornians were never in the shelled-almond business, as they acknowledged th output has been infinitesimal. Why, therefore, should the very large num consumers of shelled almonds be penalized for what, after all, is only a poss we would say, very improbable) future benefit to Californians, and certainl benefit that they would derive at the present time, as they acknowledge th have not got the yield.

In passing, we would point out that the very large quantity of shelled a imported shows that these are necessities of the manufacturing confectioners a other industries which we have previously mentioned, and can practically sidered as part of their raw material.

r large demand by the Hebrews, with whom it has been a custom to make such s for their various religious holidays. They are produced in and near Valencia, in.

is a well-established fact that these various varieties can not be produced in fornia, and it is well known that the California product is of a fibrous nature and ing in flavor, and they have been trying to produce shelled almonds for commer- purposes for the last 25 years, but without success to the present time, and for reason manufacturers of confectionery and cakes have found it impossible to use their business.

the argument submitted by the California growers they have claimed additional ection, so that the present uncultivated lands in that State may be utilized for growth of almond trees, and they claim that such trees would commence to bear t in from two to three years. This has been positively contradicted by experience, ch has shown that almond trees do not bear fruit before they are at least of five even years' growth. We urge, therefore, that it would be a burden to a very e number of consumers in the United States, which is practically the entire general lic, if additional import duties be imposed.

he Californians also mention the amount of capital invested in their almond ards and approximate the same as $50,000,000 and the number of persons em- yed as 50,000 during the harvest season, which is presumably not more than two ths, and 5,000 for the remainder of the year. This is stated on page 2004 of the imony given by Mr. Pierce before the Ways and Means Committee.

s against this investment, we would point out that the manufacturing confec- ers and chocolate manufacturers have an estimated capital invested in their inesses to the amount of $250,000,000 and employ 120,000 people all the year nd. These figures do not include about 75,000 small retailers, very many of m manufacture candy in a small way and employ from two to five people in each e. The baking industry has a capital of about $500,000,000 and employs about ,000 people all the year round. The biscuit and cracker manufacturers have an ested capital of about $100,000,000 and employ about 50,000 people all the year nd.

We now beg to refer to the testimony given before the Ways and Means Committ on January 25, 1921, "Tariff Information, 1921, Bulletin No. 17," by Mr. T. C. Tuck representing the California Almond Growers Exchange.

On page 1907 Mr. Tucker stated that he represented about 85 per cent of the cr We presume he meant of the California growers. He furthermore stated that the in California in 1920 was about 5,500 tons; that is, equal to about 11,000,000 pou in the shell.

We submit to the committee that the importations of almonds during the year 19 were 90,119,110 pounds, as shown by the United States Statistical Department. Th indicates that there was imported into this country in the year 1920 at least eig times the quantity of almonds that was produced in California in the same ye We therefore call to the committee's attention that, inasmuch as California prod only one-ninth of the amount of almonds consumed in this country, it would not right that the large number of consumers of these goods should be penalized by t imposition of a very heavy additional import duty.

We furthermore submit that if the additional duties are imposed, it will result a very large decrease in the quantity of almonds which will be imported, and as a co sequence, the United States Treasury will not receive the equivalent in duties tha expected if Congress anticipates that imports will continue as before.

In connection with this subject, we would also mention that in our opinion t resultant decrease in the importation would have a tendency to place out of emplo ment a very large number of people who now are employed in the confectionery a baking and allied trades.

Furthermore, the witnesses for the California Almond Growers' Association h tried to convey the impression to Congress that the imposition of an additional d would not affect the cost of almonds to the consumer.

This is absurd, in view of the testimony given by Mr. Tucker and shown on p 1908 as follows:

"In normal times paper-shell almonds brought 35 cents a pound in the shell, cents per pound for the seedling variety, which represent the major portion of crop. The average last year, during the war and war conditions, was about 47 cen pound for paper-shell and 35 cents a pound for seedlings."

At the ratio, which they state is 3 pounds of almonds in the shell to produce 1 po of shelled almonds, the price of shelled almonds to the California growers would three times the above; in other words, from 75 cents to $1.05 per pound in nor times, and, on the basis of the prices that obtained last year, it would be from $ per pound to $1.41 per pound for shelled almonds.

The average price of imported shelled almonds to the manufacturing indu which use them was, last year, not more than 30 cents per pound.

The question is raised whether it is wise to impose this additional cost upon the sumption of food products, of which almonds constitute an important part, and as to whether this increase would not lead to practical substitution, and consequ the elimination of almonds from a large part of bakery and confectionery pro

With further reference to the prices obtained for the California almonds in the as above mentioned, we beg to refer to page 1909, in which Mr. Tucker stated

"The University of California gave their estimate of the cost of producing th crop at approximately 16 cents per pound in the shell."

It is very evident that if the goods were sold to consumers at from 35 cents per p to 47 cents per pound, there was an enormous profit to the growers, and they sur not need any further protection.

On page 1908 Mr. Tucker testified:

"We have sold a few shelled almonds on the Pacific coast, our sales being pr one-half of 1 per cent of our total cost." (A typographical error, as it probably "crop.")

On page 2005 Mr. Pierce stated in his testimony:

"The present existing law has put us out of the shelled-almond business."

It is evident from Mr. Tucker's testimony that to all intents and purposes th fornians were never in the shelled-almond business, as they acknowledged tha output has been infinitesimal. Why, therefore, should the very large num consumers of shelled almonds be penalized for what, after all, is only a possib we would say, very improbable) future benefit to Californians, and certainly benefit that they would derive at the present time, as they acknowledge that have not got the yield.

In passing, we would point out that the very large quantity of shelled alm imported shows that these are necessities of the manufacturing confectioners a other industries which we have previously mentioned, and can practically be sidered as part of their raw material.

We have the authority of Mr. Henry Heide, New York City, who is a large manu-'turer of almond paste, as well as confectionery, to state that his company and one ier large company manufacturing chocolate products combined would consume as iny almonds as are now produced in California, provided that the quality of the ne was suitable for their purposes, but experience has shown that this is not the case. . Heide states that at one time he purchased some California almonds, but that the icles he manufactured with them were so unsatisfactory, owing to the fibrous nature he nuts, that he was compelled to sell in the market the larger part of the quantity California almonds which he had bought. And he further states that California ionds for manufacturing confectionery purposes could only be used by mixing m with the imported, and then not in excess of a ratio of 10 per cent.

ls corroborative to this matter we quote the following letter:

JULY 12, 1921.

LIFORNIA ALMOND GROWERS' EXCHANGE,
311 California Street, San Francisco, Calif.

iENTLEMEN: To be perfectly frank, your letter of the 6th does not strike a very ponsive chord. The experience of the confectionery trade with California shelled ionds is, we believe, not favorable enough to induce them to make any strenuous rts in their behalf, and we are quite sure that other manufacturers are of the ie opinion.

f California shelled almonds were able to take their place in real competition with foreign almonds, this question of protection would not be as seriously pushed and r sales efforts would have been productive of a larger distribution of shelled almonds he confectionery trade. Whether the factors of flavor and texture can be brought in California almonds to the standard of foreign almonds so that they can be gen-ly used by the manufacturing trades is a question that is undoubtedly interesting . From our own standpoint the California almond is a negligible quantity until in really compete in these two essentials with the foreign almond.

n this basis, as you may see, we are not particularly interested in furthering your is for duty. In fact, we are quite on the other side of the question.

Very truly, yours,

THE WALTER M. LOWNEY CO.
WALTER H. BELCHER, *Vice President and General Manager.*

'e are also authorized to inform you that recently Mr. Heide endeavored to pur-e a small quantity of California shelled almonds for experimental purposes and plied for them to the California Almond Growers' Exchange and was informed that could not supply him, not having the goods on hand.

'e wish to ask what would become of the necessities of the chocolate manufacturers, confectioners, and the other allied trades should an increased rate of duties be osed? Should they be compelled to depend upon California to supply their led almonds to carry on their business all the year round, when California can supply any shelled almonds now?

is in view of the importance of these products to the manufacturers that we ectfully contend that the duty on shelled nuts should not be based on a ratio of e times the duty on nuts in the shell.

n account of the natural growth in the use of these nuts in the bakery and con-ionery trades, it is probable that the total consumption for last year was upward ,000,000 pounds of shelled almonds, which increases the ratio above mentioned bout 10 times. It is hardly consistent, therefore, to penalize the consumers the baking and confectionery businesses for the benefit which might accrue to California yield of one-eighth in volume of the whole consumption in the United es, all of which benefit, if any, would inure to one State only, namely, California, would be paid for by consumers of the other 47 States.

ith reference to the length of time necessary to produce fruit-bearing almond , we quote from page 1955, under the head of "Yield":

Almonds first commence bearing at from 2 to 4 years of age, the first crop ranging one to two nuts up to a hatful or possibly more. The trees would first commence ear a crop which will pay to harvest at from 3 to 5 years of age. Ordinarily it be nearer the latter, depending upon the type of soil in which the trees are growing the moisture conditions surrounding."

om this statement it appears that at least five years would be consumed before of the trees in the almond groves which might be established at the present time d be in such condition as to give any considerable yield. This is not the way rican industries are built. The bakers and confectioners have to be assured at imes that they can get their raw material. California admits that it is not yet in ion to furnish this, and yet is unreasonable enough to request the adoption of

this very unbusinesslike plan of protection of an industry which, by their own ment, does not need protection, and from which they could derive no benefit least five years to come, if then.

We furthermore point out and reiterate that even though California were planting almond trees for the purpose of obtaining a yield in the time mentioned exceedingly doubtful indeed whether they would be able to produce almonds qualities and grades which are needed by the confectioners and bakers' industries.

The following are the statistics of the California almond crop for the years 1920 and of the importation of almonds for the years 1912 to 1919 (as taken from California Fruit News, annual review number, 1920), and the very large quant shelled almonds imported shows conclusively that California has been un supply the requirements of the manufacturing enterprises above enumerated.

California almond crop.

	Tons.		
1900	2,740	1911	[illegible]
1901	1,590	1912	[illegible]
1902	3,270	1913	[illegible]
1903	3,200	1914	[illegible]
1904	800	1915	[illegible]
1905	2,100	1916	[illegible]
1906	750	1917	[illegible]
1907	750	1918	[illegible]
1908	2,900	1919	[illegible]
1909	1,500	1920 (not final)	[illegible]
1910	3,300		

United States imports of almonds (fiscal years).

Year.	Not shelled.	Shelled.	Total.	Year.	Not shelled.	Shelled.	Total.
	Pounds.	*Pounds.*	*Pounds.*		*Pounds.*	*Pounds.*	*Pounds.*
1912–13	2,592,187	13,078,771	15,670,958	1916–17	5,010,833	18,413,225	[illegible]
1913–14	5,730,774	13,307,631	19,038,405	1917–18	4,278,990	19,561,156	[illegible]
1914–15	4,902,713	12,208,551	17,111,264	1918–19	6,733,542	23,594,915	[illegible]
1915–16	2,929,155	13,667,766	16,596,921	1919–20	7,355,804	26,326,245	[illegible]

We suggest that the rates of duty on almonds in the bill now before Congress, graph 754, should be changed to read as follows:

"Almonds in the shell, 4 cents per pound; shelled almonds, 6 cents per pound."

This would give an increased revenue to the United States Treasury and, we would not be a serious burden to the manufacturing industries.

WALNUTS.

The last statistics indicate that California produced in the year 1919 pounds of walnuts in the shell (p. 1743, Tariff Information, Bulletin No. 16).

The quantity of walnuts imported into the United States in the year 10,041,342 pounds of shelled walnuts and 20,235,078 pounds in the shell. As 4 pounds of walnuts in the shell to produce 1 pound of shelled walnuts, it is to multiply the quantity of 10,041,342 by 4 in order to arrive at a basis of com with the output of California. This makes a figure of 40,165,368 pounds, must be added the 20,235,078 pounds imported in the shell, making a grand 60,400,446 pounds.

The shelled walnuts imported into this country in the year 1920 as above several varieties and from various countries, for instance:

Mayette.—There are about 500,000 pounds of this grade imported annually United States. These are known to be the finest flavored walnuts grown and mainly to the household trade through the fancy grocers. They are also used by facturing confectioners and bakers for topping chocolate and fancy cakes. produced in the Grenoble district in France.

Chabert.—There are about 2,500,000 pounds of this grade imported annually United States. They are used likewise by manufacturing confectioners and for topping purposes. They are, as a rule, small in size, and for this reason are ical in use for the purposes mentioned. These walnuts are also used

manufacturers of fruit sirups for retail soda fountain use, and the consumption this purpose is very large. These are also produced in the Grenoble district of nce, and also in the Dauphiné district of France.

Bordeaux.—There are about 10,000,000 pounds of these walnuts imported annually the United States, and they are used mainly for household purposes, being sold the consumers through the grocery trade. They are also used by manufacturing fectioners and by bakers and ice-cream manufacturers. They are a product of southwestern Provinces of France.

Spanish.—There are about 1,500,000 pounds of this grade imported annually into United States. These are similar to the Bordeaux shelled walnuts, and are used similar purposes. They are a product of Catalonia, in Spain.

Turkish.—Owing to the distress caused by the war, there have been comparatively ll quantities imported in recent years, but prior to the war they were imported arge quantities and were sold here for similar purposes as the Spanish and French nuts.

r. Teague, of the Walnut Protective League, states that California walnuts are erior to imported. Why then put a higher duty on an inferior walnut?

10 years production increased two or three times, during which time the cost of fornia walnuts also increased about 30 per cent. With a higher duty California nut Growers' Association would be able to ask the public higher prices with no petition of foreign nuts, and with increased acreage and higher duty and no petition would have a monopoly of the walnut business in this country.

rench.—Cost of importations on French walnuts to-day for 1921 crop is 1,550 to 0 francs c. i. f. New York; figuring exchange at 8 cents, would cost about 58 cents ond; proposed duty, 15 cents; expenses (cost of importation), 2 cents; duty paid, to import, 75 cents per pound.

he consumer and public would be paying $1 a pound for shelled walnuts, a food le.

e ask why should the public be taxed the difference in price for a food article by confectioners and bakers to satisfy an association which can not supply the and for shelled walnuts, and with an increase in duty cut the importation to such xtent that less revenue will be received by the Government?

summary of the brief of the American walnut industry they state increased tariff helled walnuts will not add to price of the consumer. Our answer is, if not, who pay the increased duty?

r contention is increased duty has to be added to the cost price, and naturally increases the cost to the public.

lifornia shelled walnuts to-day are selling at a higher price than imported and not supply the demand for walnuts in this country.

e ask, then, why should shelled walnuts pay a higher duty to allow an association mand from the public even higher price and cut off revenue from the Govern- t?

r contention is that the importation of walnuts will not increase, as during the great many walnut trees were cut down, especially in France, for the manufac- of gun stocks, and the consumption of walnuts for home use in France has increased, by increasing the price considerably.

ES TO STATEMENTS MADE BY C. THORPE, REPRESENTING THE WALNUT PROTECTIVE LEAGUE.

. Thorpe stated that the American producers are supplying 70 per cent of the total mption of walnuts used in America. This statement is not correct, as statistics ate California produced in 1919 56,496,300 pounds walnuts in shell, against the importation of 60,400,446 pounds. Mr. Thorpe stated he speaks of English uts. Such a walnut is not grown, but walnuts are grown on the Continent of pe.

. Thorpe states the imports for 1920 were over 38,700,000 pounds. Where does t his figures from when the season for importation of 1920 is not yet over and will s over until October 1, 1921? This statement, therefore, is incorrect, as 1920 crop s can not yet be obtained.

Thorpe stated a tree has to be 10 years old before it reaches profitable produc- -15 to 20 years before it reaches full bearing. Does he expect the American r and the manufacturer to wait, say, 15 years until California can produce suffi- walnuts (shelled principally) and in the meantime ask that the public be made igher prices through advance in duty until such time arrives that California can lly supply the demand of the American public at a reasonable price?

Furthermore, Mr. Thorpe asks for higher rate of duty because of increased pro-duction, for protection to a monopoly. Increased production should be for lower prices to the consuming public and not higher by an increased rate of duty for which the consuming public has to pay for protection to an association or so-called trust.

Under date of September 9, 1920, Messrs. Wood & Stevens (Inc.), representing the California Walnut Growers Association, stated in their circular as follows:

"We can not remember a year when the early fall demand for California walnuts did not greatly exceed the supply. It is our prediction that this year will be no exception, for the association reports that the California crop will be at least 10 days later than normal in maturing. Thus, right up to Thanksgiving, California walnuts in this market should command a material premium over the opening."

Why then a higher rate of duty on shelled walnuts when the demand can not be supplied by California?

We submit herewith proof of letter from the J. Hungerford Smith Co., of Rochester, N. Y., who are large manufacturers of soda fountain requisites, and one of the largest users of walnuts in the United States.

AUGUST 12, 1921.

BIRDSONG BROS.,
Hubert and Washington Streets, New York.

GENTLEMEN: We are very much interested in your letter of August 11 regarding shelled walnuts. If, as we assume is the fact, the trade generally has been as much affected by the advance in price as we have been it is perfectly clear to us that there will be very few sold at the present prices. In fact, our sales have been so light that the writer is almost inclined to consider the wisdom of selling part of our nuts at this time and it may be that you will hear from us further on this subject.

With best wishes for your success in avoiding an increase in the tariff, we remain,

Very truly, yours,

J. HUNGERFORD SMITH CO.,
R. H. ROGERS, *Purchasing Agent.*

Mr. Thorpe stated that for their best grade of walnuts they receive 22½ cents. It is not correct, as for their best grade of walnuts in shell, which is their fancy budded grade, the opening price of the California Walnut Growers' Association for their 1920 crop was 25½ cents, and price was made on October 1, 1920.

We also wish to call your attention to the fact that it is rumored that the California Walnut Association in naming their price for the 1921 crop will be even higher in price than the prices made by them in 1920 on account of no carry over of the 1920 crop. They take advantage of this situation by asking the public a higher price, having everything their own way, or, in other words, a monopoly on walnuts grown in this country. Why, then, should there be this higher proposed duty?

The attached circular No. 1, 1921 season of the California Walnut Growers' Association, dated July 15, 1921, is very illuminative.

They quote from a letter received by them from their foreign representative outlining the condition of the walnut crop in the Bordeaux district of France, in which he states:

"I was unprepared for the reality which is almost in the nature of a calamity; walnut trees in all this section of the country are, with rare exceptions, in a very pitiful state. The majority carries little or no fruit, and on an average every bearing tree is counterbalanced by nine at least in bad shape."

And then later he further states:

"I do not think that this year the American producer will have much to fear from the competition of France, for, as far as I can judge at present, the crops all over the country will not much exceed half the normal output. I am led to this conclusion, first, because two-thirds of the trees are practically unproductive; second, because the remaining third, though well provided with fruit, is losing part of it by premature droppings from the effects of late frosts and early morning mists, particularly in mountain valleys and lowlands; and third, because the stocks of nuts left over from last year, according to all reports, are about exhausted; that is to say, of a quality suitable for exportation—a rare occurrence and a remarkable feature of the late campaign."

We point out to the committee that these are statements issued as above stated in circular of the California Walnut Growers' Association.

The following are the statistics of the California walnut crop for the years ... 1920 and of the importation of walnuts for the years 1912 to 1920, as taken from California Fruit News, annual review number, 1920:

California walnut crop.

	Tons.		Tons.
[illegible]	5,430	1911	12,500
[illegible]	6,900	1912	11,250
[illegible]	8,570	1913	11,350
[illegible]	5,500	1914	8,900
[illegible]	7,590	1915	14,825
[illegible]	6,400	1916	14,600
[illegible]	7,000	1917	16,500
[illegible]	7,400	1918	19,950
[illegible]	9,200	1919	28,100
[illegible]	9,350	1920 (not final)	20,500
[illegible]	9,600		

United States imports of walnuts (fiscal years).

Year.	Not shelled.	Shelled.	Total.	Year.	Not shelled.	Shelled.	Total.
	Pounds.	*Pounds.*	*Pounds.*		*Pounds.*	*Pounds.*	*Pounds.*

his shows that California increased their production 500 per cent between the years and 1919, and the largest increases have been since the operation of the present f act (1914 to date).

there any real basis for their assertion that they need additional protection?

e suggest that the rates of duty on walnuts in the bill now before Congress, parah 758, should be changed to read as follows:

Walnuts in the shell, 3 cents per pound; shelled walnuts, 6 cents per pound."

SWERING ARGUMENTS OF THE CALIFORNIA WALNUT PROTECTIVE ASSOCIATION.

Quotation of Wood & Stevens does not state what grade of walnuts offered or how or poor sample was."

tter to C. Thorpe: "We contend a great deal of merchandise held by banks ng the months of December and January last had to be sold at best obtainable s, and this is particularly true of far eastern products, and really did not show market values."

tter to C. Thorpe from Wood & Stevens: "Our contention is walnuts sold at aucby Brown & Siccomb are usually sold for underwriter's account or walnuts carover from one season to another which jobbers do not wish to handle, and really s for goods sold at auction do not show market values on walnuts any more than other article sold at auction."

st of labor.—On page 1960, under the heading of "Wages of male farm labor," they that California paid in 1918 an average wage of $78 per month without board, and the average United States cost of labor at the same period was $47.07 per month out board. This shows a difference in favor of California labor of about 60 per It is certainly pertinent to ask, therefore, why the labor in other States of the n, and which constitutes a large part of the consumers of bakery products, etc., ld be compelled to pay increased prices for their foods to the ultimate benefit e much higher paid California labor?

e increased rate of duty will not add to revenues of the United States Treasury, nportation will be decreased to one-third. Therefore, why should a higher rate ity be placed on shelled walnuts to protect a new development at the consuming ic's expense by placing a duty of 12 cents per pound on shelled walnuts?

. Thorpe stated the importers will tell you that we have been getting outrageous s for our walnuts. Our contention is that the California association has been ng outrageous prices. Furthermore, because 40 per cent of their crop never makes cy grade, we ask, is this a reason for advancing duty on walnuts and making the ic pay for it?

. Thorpe stated they used 4,900 bags in near-by produce plants at 5½ cents, which is, r opinion, a good price for an article used for by-products, the walnuts referred ing evidently unsuitable for eating purposes.

Mr. Thorpe stated they received $5 a ton for charcoal made out of this walnut she
This, in our opinion, is clear profit, as the actual cost of the walnuts in the shell us
to produce shelled walnuts is always figured as so many pounds in the shell to ma
a pound of shelled goods. Consequently, whatever is left for salvage is profit, sh
having already been figured in the original quantity used for shelling.

We would call attention to the fact that California has, in the past, endeavore
produce walnuts of similar quality to the best French walnuts, and to this end
grafted from the Mayette walnut trees to their indigenous growth of walnuts. T
result obtained was a hard-shelled walnut with meat of dark appearance and p
flavor.

[Circular No. 1, 1921 season.]

LOS ANGELES, CALIF., *July 15, 19*

To our trade:

Spot walnuts both from the 1919 and 1920 crops have long since been entir
exhausted, and in harmony with our predictions made shortly after the turn of
year the market continued to materially advance until all spot stocks both in
hands of jobbers and retailers were completely disposed of. Consequently, the
crop will come onto the barest market ever experienced.

Our early prospects were for by far the largest crop of California walnuts ever
duced. In fact, our early predictions were for a 60,000,000-pound production, but
in April frosts played havoc in some of the heaviest producing sections, entirely w
out the crop on some groves, and cutting many others down between 20 and 50 per
of their original setting. However, as the walnut-producing sections of Californ
scattered over a very large area, some districts escaped with little or no frost dam
A complete check-up of the situation leads us to believe that the total frost damage
not exceed 35 to 40 per cent, which will develop a total production of between 90
100 per cent of last year's short crop. In other words, the State will probably
duce thirty-six to forty million pounds.

It will be remembered that last year there was a considerable carry over of
crop goods, both in the hands of the association and in the hands of the trade, w
came into competition with the new crop. This year the situation is entirely dif
ent and there will be no such competition. Also, there was a considerable stoc
imported goods available for distribution last fall which will not be available
season.

The maturity of the California crop will probably average a week to 10 days
this year than last. The average size of the walnuts will probably be a shade sm
than last year, although sizes will average much larger than they did in 1919. So
since April, climatic conditions have been quite satisfactory, and barring the p
bility of an extreme heat wave during the balance of July or August, the cra
quality of the nuts should be exceptionally good. The meats should average p
and light colored.

Foreign prospects are also for a very, very short crop. We quote from a letter
received from our foreign representative under date of June 17:

"I have just returned from the region of Bordeaux where I made an extended s
of the principal walnut growing centers. To say that I was surprised at what
everywhere on my rounds, which embraced over 150 kilometers of territory, do
express in strong enough terms the sensation I experienced. I was dumbfou
I had expected to find that some damage had been done by the inclemencies of
weather which, since the middle of April last, after the long dry spell, has bee
settled and stormy more or less all over France, with brusk changes of tempera
the intermittences of heat and cold, stormy rains—sometimes accompanied by
and sunshine having been generally of short duration, but I was unprepared for
reality which is almost in the nature of a calamity, for walnut trees in all this sec
the country are with rare exceptions in a most pitiful state. The majority
little or no fruit and on an average every full-bearing tree is counterbalanced
nine at least in bad shape. I encountered here and there, it is true, a few prosp
looking trees in full foliage and bearing well, but, strange to say, standing all a
these were sickly looking ones showing signs of decay and slowly perishing.

"The characteristics of the disease, attributed to a cryptogamic origin fo
of better knowledge, that is progressively destroying vast quantities of walnu
all over France, and they may be counted not by hundreds but by thousands
withering of the top and outer branches, the interior ones still carrying a ce
amount of verdure. The aspect of a tree in this condition may be likened to a
with pins stuck all over it. Even young trees, only 8 or 10 years old, and eve
are attacked by the malady, so that the disaster is complete. I wish you could hav

ith me on my rounds; you would have hardly believed your eyes, accustomed as ou probably are to see only trees luxuriant in verdure and fruit. The situation has last aroused to action the competent authorities for I am given to understand that Government commission has been appointed to inquire into existing conditions and try to provide means to stop the progress of the disease which is slowly but surely epopulating the country of the walnut.

"I do not think that this year the American producer will have much to fear from ie competition of France for, as far as I can judge at present, the crops all over the iuntry will not much exceed half the normal output. I am led to this conclusion: irst, because two-thirds of the trees are practically unproductive; second, because e remaining third, though well provided with fruit, is losing part of it by premature oppings from the effects of late frosts and early morning mists, particularly in cerin valleys and low lands; and, third, because the stocks of nuts left over from last ar, according to all reports, are about exhausted—that is to say, of a quality suitable r exportation—a rare occurrence and a remarkable feature of the late campaign.

"I am informed, as a matter of fact, that whereas less than three months ago 'Cornes' d 'Marbots' in the shell were offering at 140 francs per 100 kilos ($5.22 per 100 unds) spot, without freely finding takers, 15 days later they commanded the double th numerous buyers consequent on a brisk demand for the United States which ddenly sprung up after a prolonged 'dead' period. And during the two months at followed shipments of nuts and meats to America were quite important. I must y that in all my experience I have never known of a turn in the market similar to at which has occurred this year, and which has resulted in profit where certain loss is anticipated by many dealers on this side.

"Here in the Isere the outlook for the coming crops is not much more favorable, things considered, than in the region of Bordeaux, for the young nuts, according all accounts, are dropping a little everywhere in appreciable quantities from the er effects of unpropitious weather in April and May. The fruit is now about the e of small olives. In several that I picked up and cut open I could discover no aterial defect except a tendency to wither, which I attribute to want of nourishent."

The policy of the California Walnut Growers' Association has always been to recoge the wishes of its trade in molding its sales policy. In line with this, it was one the first packers to abandon the "firm at opening" contract and the "S. A. P.," d even tentative prices and contracts are not being considered. In fact, at a recent eting in Chicago with the contract committee of the National Wholesale Grocers' sociation, a new form of contract was devised which now carries the official apoval of the National Wholesale Grocers' Association, one of the first coast concts to carry such official indorsement. By the terms of this contract this associan is to accept orders only after opening prices are named about the 1st of October, contention being that by that time the buyer will be in a position to better judge exact requirements and the seller the extent of its pack and the amount which ll be available of each grade and variety. Also under this plan it will be necessary the shipper to name opening prices at such a figure as will develop a strong demand d consequently an advancing market in order that the entire crop may be promptly ved into channels of consumption. Also there should be no excuse for any buyer rchasing an oversupply which, upon delivery, would cause him to become panicky d offer his goods below cost or at prices that would demoralize any local market uation. In fact, we believe we now have a contract which is ideal, at least from buyer's standpoint, and which should enable every jobber to make a fair profit his Diamond brand walnut business.

Our representative, if he has not already done so, will shortly call upon you for ir estimated season's requirements of Diamond brand walnuts. This information l be forwarded to us and be used to guide us in making territorial allotments our estimated crop. Our brokers will be made allotments based on past sales in ir markets, which will insure that each of our customers is offered his proportion our output.

CALIFORNIA WALNUT GROWERS' ASSOCIATION.

[Circular No. 5, 1920 season.]

IMPORTANT NOTICE—PRICE ADVANCE.

LOS ANGELES, *February 15, 1921.*

our trade:

t is a great pleasure to be able to advise our trade that coast stocks of all grades of h 1919 and 1920 crop association walnuts are entirely exhausted, with the exception three cars 1920 crop No. 2s, which will not be offered until next fall.

Our consigned stocks in most markets are also exhausted and where they are not are so small that one day's fairly active business will clean them out.

Price advances of 1 cent per pound have been in effect in New York and a number of other large markets for some time and effective February 25 this advance of 1 cent per pound on No. 1s and fancy budded will be made general everywhere.

It is our sincere advice to our trade in those markets where goods are still available and obtainable that replenishment stocks be taken on immediately. Now is the time that each jobber should see that he has a sufficient supply of Diamond Brand walnuts to last for at least the next 60 days, for when stocks are as closely exhausted as they are now, with several months of heavy consuming period before us, it is certain that the trade can make a better profit on California walnuts now than has been possible for many, many months, and with the association's prices advancing within the next few days, additional market strength is assured.

The very heaviest period of our season's advertising campaign is at hand. We are strongly featuring walnuts as a meat substitute during Lent. Again, the Jewish trade will use a great many walnuts during their Passover season, commencing the 1st of March, and with sugar so cheap that the housewife is making more cakes, candies, and confections than usual (in all of which walnuts are freely used) the demand during the next few months is bound to be much greater than the available supply and there is bound to be a repetition of the situation which existed in the winter and early spring of 1919, when Diamond Brand No. 1s went from 28 to 38 cents per pound. It is absolutely certain that the association's consigned stocks everywhere will be completely exhausted within the next few days and the market then will be what the trade themselves make it.

All foreign walnuts in eastern markets are also well cleaned up, and the price of foreign walnuts has been steadily advancing within the past few weeks. It is a certainty that there will not be a pound of California walnuts carried over into fall, and the new crop is sure to come into the cleanest market ever known.

It is for this reason that we strongly advise our friends to check over their stocks and order the balance of their winter and spring requirements immediately, while offered at the present lowest prices still prevailing.

Sincerely, yours.

California Walnut Growers' Association.

Filberts.

There are no filberts of any appreciable extent grown in the United States, certainly not enough to be considered commercially. The importations are from Spain and from Turkey, and the total quantity imported in the year 1919 was about 3,600,000 pounds. They are used largely by manufacturing confectioners and by bakers, also by manufacturers of chocolate bars.

We suggest that the rates for filberts in the tariff bill now before Congress, paragraph 755, should be changed to read as follows:

"Filberts in the shell, 3 cents per pound; shelled filberts, 6 cents per pound.

Finally, in connection with this subject, we would call attention to the fact that nuts have been recommended by dietitians for increased use as an article of food having been established that they contain very nutritious properties. We would refer, as an authority, to the treatise entitled "Feeding the Family," by Prof. Mary Swartz Rose, Ph. D., Columbia University. On page 344 the following food values are given:

100-calorie portion—Distribution of calories.

	Measure.	Weight.	Protein.	Fat.	Carbohydrate.
		Ounce.			
Almonds............................nuts..	12-15	0.5	13	78	
Filberts..............................do....	8-10	.5	9	84	
Walnuts............................meats..	8-16	.5	11	82	

In view of their value above shown, it would appear to be unjust to the very large numbers of consumers in this country that such valuable articles of diet should be largely increased in price by the imposition of heavy import duties, simply

ıe benefit of the growers in California; and especially does this become apparent hen it is recognized that California is unable to produce almonds, walnuts, or filberts quality equal to those imported from the countries above enumerated. Why ıould the people of 47 States of the Union pay largely increased prices on such aluable food products simply for the benefit of one State (California)?

STATEMENT OF WALTER C. HUGHES, REPRESENTING THE NATIONAL CONFECTIONERS' ASSOCIATION.

Mr. HUGHES. Mr. Chairman, the association which I represent in-ludes 725 manufacturers of candy. It represents about 80 per cent the entire output of the industry in the United States.

We have with us at this hearing our officers and members of the xecutive committee; also Mr. Herman W. Hoops and Mr. William . Heide, of New York City, who are large manufacturers and who ould be glad to answer any questions which the committee may care ask and which I may not be able to answer.

The proposed amendment to the pending tariff bill that was intro-uced by Senator Johnson relative to the tariff on almonds provides ıat almonds, not shelled, shall be at the rate of 5 cents per pound, nd almonds, shelled, at the rate of 15 cents per pound. We consider ıat these rates are unjustifiably and unreasonably high, and the rates e propose on almonds are: Almonds, not shelled, 4 cents, and lmonds, shelled, 6 cents per pound.

Senator SMOOT. Those are the rates you want?

Mr. HUGHES. Those are the rates we want; yes, sir.

Senator WATSON. Let us have those figures again.

Mr. HUGHES. The rates we want are: Almonds, not shelled, 4 cents; lmonds, shelled, 6 cents per pound. The proposed rates, as I said moment ago, are: Almonds, not shelled, 5 cents, and almonds, shelled, 5 cents. The present rate is: Almonds, not shelled, 3 cents, and for lmonds, shelled, 4 cents per pound. That is the duty at the pres-nt time.

The United States Tariff Commission is authority for the statement ıat the world's output of almonds is approximately 725,000,000 ounds and that the exportable surplus is about 200,000,000 pounds, which the United States takes about 40 per cent, or about 80,000,000 ounds.

On the unshelled basis—in considering the tariff we must take into onsideration the unshelled basis, due to the fact that California oes not produce shelled almonds—in 1919, the fiscal year, in round gures, the domestic production was about 10,000,000 pounds, hereas the imports were 76,000,000 pounds.

Senator SMOOT. Of course, the California growers deny that they o not produce the shelled almonds. I do not know whether the her members of the committee have received them, but I have been nt samples to show that the statement is not true.

Mr. HUGHES. I intended, Senator Smoot, to refer to that matter ter on, but inasmuch as you have asked that question, I shall refer it at the present time.

Senator WALSH. You will have to send samples to prove that it is ue.

Mr. HUGHES. I shall be very glad to do that.

Senator MCCUMBER. The almonds raised in California have to be ıelled somewhere before they are used.

Mr. HUGHES. One of our members tried to purchase California shelled almonds a short time ago. That was after a plant in Sacramento had been erected for the express purpose of making shelled almonds, and he sent an order there for the purpose of getting a few bags in order to try them out experimentally. They wrote back and told him they did not have any shelled almonds for sale.

Senator SMOOT. They have closed up their plant, haven't they?

Mr. HUGHES. I could not say, Senator, whether it was closed or not, but my understanding is that it is not now being operated. Under date of August 19, 1921, the California Almond Growers Exchange, at San Francisco, Calif., wrote a letter to Bevan & Co., Malaga, Spain, in regard to almonds, in reply to a letter received from that firm to the effect—and I shall refer only to that portion which has reference to Senator Smoot's question—that they did not deal to any extent in shelled almonds; that their sales are principally for nuts in the shell, very largely consumed during the holiday period.

In all the experiments that have been made by our manufacturers relative to the use of California shelled almonds they have never found them to be satisfactory. As to the crop of 1920–21, the California almonds amounted to 11,000,000 pounds, whereas the imports amounted to 55,000,000 pounds, in round numbers. Therefore the United States produces between 1 and 2 per cent and consumes about 12 per cent of the world's almond crop.

This California Almond Growers' Exchange that I referred to a moment ago markets about 75 per cent of the almond crop; in other words, it regulates prices and controls distribution.

The total California crop during the fiscal year 1919–20 was less than one-fifth of the total amount of almonds that were imported during that fiscal year.

They talk about increasing the almond output. If their production during the next 10 years is increased in the same proportion that it has increased during the past 10 years, in 1929 and 1930 the crop would only amount to about 20,000,000 pounds, which is far short of our requirements.

In this connection I also want to say that it takes approximately seven years for the almond tree to get to the point where it is commercially bearing. It is true that perhaps in four or five years you might get a hat full of almonds off the tree, but so far as what they call profitable production is concerned, it would take in the neighborhood of seven years for a tree to get to that point where it does produce a good crop of almonds.

Senator SMOOT. How long does a tree produce a crop?

Mr. HUGHES. I could not say as to that. I know this, that almond trees bear for a great many years, but just how many I could not say.

With reference to the question of usage, these almonds are used very largely by confectioners—by the bakers, by almond-paste manufacturers, by the biscuit and cracker makers. All these various food industries use the imported shelled almond, as well as the salters of shelled nuts. On account of this varied use to which almonds are put, they require many different types of almonds. There are about a dozen different kinds of almonds that are imported in order to meet the requirements of these various manufacturers of food products. California does not produce these varieties. They can be produced or procured only from the Mediterranean countries that grow the varieties required by the manufacturers.

I referred a moment ago to the question of the possibility of the ıanufacturers using California almonds. Assuming, for instance, hat they can shell them and put them on the market, our manuıcturers have found that when the California almond is shelled it is ot satisfactory for manufacturing purposes for the reason that it ›ses its flavor; it becomes hard and fibrous, and it is not at all satisıctory as compared with the imported almond, which retains its avor and is by far the most satisfactory.

Take into consideration, for instance, the argument that was adanced by the California Almond Growers' Exchange, that this proction is necessary in order to protect the industry—the almond-owing industry—and that they had an investment of approxiately $50,000,000. The industries that use imported almonds have capital investment of about $1,000,000,000. The confectionery dustry alone has a capital investment of about $315,000,000, as shown by the last census. Therefore, we feel that, so far as this lestion of a very high tariff is concerned, it is not necessary for the otection of the home industry and that it is unfair to burden these dustries that use almonds to the extent of imposing a tariff of 275 r cent increase; and it must be remembered that they can not pass at increase on to their customers in the increased cost of the product, r the very reason that the consumers are insisting that prices shall lowered rather than raised at this time. Therefore, it will not be ssible for them to increase their prices. We believe, therefore, at, as indicated a moment ago, with a tariff of 4 cents on almonds the shell and 6 cents on shelled almonds, the rate would be reasonly increased and would serve all purposes so far as the requirements revenue and protection are concerned.

Let me refer to the subject of walnuts for just a moment. The oposed duties on walnuts are: Walnuts, not shelled, 4 cents; walnuts, elled, 15 cents per pound.

For the reasons that I shall refer to hereafter, we recommend that e tariff should be: Walnuts, not shelled, 3 cents per pound; walnuts, elled, 6 cents per pound.

The present import duties on walnuts are: Walnuts, not shelled, 2 ıts per pound; walnuts, shelled, 4 cents per pound.

The same situation prevails with reference to walnuts as with erence to almonds. We have considered them on the unshelled sis in considering production in this country as compared with ports. Therefore, in 1918–19 the domestic production was larger ın the imports; it was 40,000,000 pounds as compared with ,000,000 pounds.

Senator McCumber. Isn't there a loss of about one-third by reason shelling?

Mr. Hughes. They shell 3 to 1, I think. There is some doubt to whether that is——

Senator Smoot. Mr. Hudson testified that it is 4 to 1.

Mr. Hughes. When I said that I had almonds in mind.

Senator McCumber. Let me see if I understand just what you mean 4 to 1. Do you mean 4 pounds of unshelled almonds produce 1 und of the shelled meat?

Mr. Hughes. With almonds it would be 3 pounds in the shell to 1 und of meat.

The domestic production of walnuts in 1920–21 is estimated at 43,000,000 pounds and the imports at approximately 65,000,000 pounds.

The shelled walnuts are used by practically the same class of trade that I referred to relative to the use of shelled almonds—bakers, biscuit and cracker makers, etc.

Imported walnuts are very much more satisfactory than the domestic walnuts for the same reason that the imported almonds are more satisfactory. When the California walnuts are shelled they lose their flavor, the skin gets tough, and other changes occur. They have a bitter flavor and are not at all satisfactory either as to size or flavor.

Senator McCUMBER. They are larger walnuts are they not?

Mr. HUGHES. Yes; they are larger than the imported walnuts.

The Walnut Protective League of California says that it takes 10 years for a walnut tree to reach a profitable bearing stage, and that when it is from 15 to 20 years of age it is in full bearing and bears for a great number of years.

Our reasons, therefore, for asking for these duties on walnuts are that they are not satisfactory for manufacturers to use for manufacturing purposes and that, therefore, the manufacturers use the imported walnuts which are satisfactory for their requirements.

Walnuts, not shelled, should be 3 cents per pound and walnuts shelled, 6 cents per pound.

BRIEF OF WALTER C. HUGHES, REPRESENTING THE NATIONAL CONFECTIONERS' ASSOCIATION.

WALNUTS.

I represent the National Confectioners' Association of the United States, comprising 725 manufacturing confectioners, whose output is about 80 per cent of the total output of the confectionery industry and including manufacturers in every State of the Union.

With me in attendance at this hearing are our officers and the members of our executive committee and several of our largest manufacturers who are members of our association.

They are all large manufacturers and I am sure will be glad to answer any questions which you gentlemen may see fit to ask them.

The import duties proposed on walnuts are as follows: Walnuts, not shelled, 4 cents per pound; walnuts, shelled, 15 cents per pound.

These rates are unreasonably and unjustifiably high, and for the reasons set forth herein we respectfully recommend the following rates: Walnuts, not shelled, 3 cents per pound; walnuts, shelled, 6 cents per pound.

The present import duties are as follows: Walnuts, not shelled, 2 cents per pound; walnuts, shelled, 4 cents per pound.

On an unshelled basis the domestic production and the imports of walnuts for the last three fiscal years as published in the tariff information surveys are as follows:

	Domestic production.	Imports.
1918-19	40,230,000	[illegible]
1919-20	59,091,380	[illegible]
1920-21 [1]	43,000,000	[illegible]

[1] Estimated.

Shelled walnuts are used extensively by manufacturing confectioners, bread and cake bakers, and by biscuit and cracker manufacturers.

The increased import duty will be added to the cost price and greatly increase the cost to the manufacturer and to the consumers.

California walnuts are selling at higher prices than imported walnuts. California ın not supply the demand for domestic-grown walnuts. Why then should the manu-ıcturers and the consumers be compelled to pay a largely increased price on walnuts ı a food product?

If the proposed duty is granted it will increase the cost of imported walnuts to such ı extent that the manufacturers can not afford to purchase them. The revenue to ıe Government from this source will be tremendously decreased if not absolutely iminated.

The Walnut Protective League of California states that a walnut tree does not reach rofitable production until it is 10 years old, and that it is from 15 to 20 years old before reaches full bearing.

California can not now anywhere near supply the demand and can not develop ıe production even in the next 15 or 20 years to such an extent as to take care of the creasing demand for walnuts.

The manufacturers will not use the California shelled walnuts, as they are not tisfactory for manufacturing purposes. When shelled they become fibrous and lack e peculiarly attractive flavor of the imported walnuts.

There is absolutely no justification for the proposed duties on imported walnuts, ıd we, therefore, ask that the duties shall be: Walnuts, not shelled, 3 cents per und; walnuts, shelled, 6 cents per pound.

Which we trust will receive your favorable consideration.

ALMONDS.

The amendment to H. R. 7456 proposed by Senator Johnson, of California, changes ragraph No. 754, to read as follows:

"Almonds, not shelled, 5 cents per pound; shelled, 15 cents per pound."

The rates proposed by Senator Johnson are unjustifiably and unreasonably high, d for the reasons set forth herein we respectfully recommend the following rates: monds, not shelled, 4 cents per pound; almonds, shelled, 6 cents per pound.

The present import duties on almonds as provided in paragraph 223 of the tariff act 1913 are as follows:

"Almonds, not shelled, 3 cents per pound; almonds, shelled, 4 cents per pound."

The United States Tariff Commission is the authority for the statement that the rld production of almonds is estimated at 725,000,000 pounds, and the export rplus at about 200,000,000 pounds of which the United States receives nearly 40 per nt. or about 80,000,000 pounds, more than twice as much as any other nation.

On an unshelled basis the domestic production and the imports of almonds for the t three fiscal years as published in the Tariff Information Surveys are as follows:

	Domestic production.	Imports.
-19	10,200,000	76,225,177
-20	15,699,748	78,350,615
-21 [1]	11,000,000	54,946,527

[1] Estimated.

The United States produces between 1 and 2 per cent and consumes about 12 per nt of the world's almond crop.

The California Almond Growers' Exchange markets about 75 per cent of the domestic p, and annually establishes minimum prices.

The total California crop produced during the fiscal year 1919–20 was less than -fifth of the total amount of almonds imported during that period.

If the same ratio of increase in the domestic crop during the past 10 years is main-ned during the next 10 years, the California crop in 1929–30 will be only about 000,000 pounds, which would be only about 25 per cent of the total amount of nonds that were imported during the fiscal year 1919–20.

It requires approximately seven years for an almond orchard to attain commercial aring, and it is therefore very evident that California can not produce anywhere ar the quantity required for domestic consumption.

The California almonds do not come into competition with imported shelled almonds. ey have always been sold in the shell for household consumption and have always nmanded higher prices than the imported almonds.

California does not produce shelled almonds. In corroboration of this statement I nt to call the committee's attention to a letter dated August 19, 1921, written by the

California Almond Growers' Exchange, San Francisco, Calif., to Bevan & Co., Mala
Spain, who are probably the largest importers of shelled almonds, which is as follo

CALIFORNIA ALMOND GROWERS' EXCHANGE,
San Francisco, Calif., August 19, 1921.

BEVAN & Co., *Malaga, Spain.*

GENTLEMEN: I have for acknowledgment your letter of July 29.

We are not in a position at the present time to give much information concern the 1921 almond crop for the reason that there is very little activity in market un the middle of September. Crop promises to be excellent, and we believe quantit will be about the same as last season. As you know, California does not deal to an extent in shelled almonds. Our sales are principally for nuts in the shell, which very largely consumed during the holiday period, and we would not even hazard guess as to the probable price. We will, however, take pleasure in cabling you th opening prices as soon as named, which will be sometime the early part of Septem and probably before you receive this letter.

We will be very glad to exchange correspondence with you as heretofore. Our f show that we addressed a number of letters to your good firm which were not answ and apparently which went astray in the mail.

With kind regards,

Yours, very truly,

T. C. TUCKER, *Manag*

One of our members a short time ago tried to purchase a few bags of shelled alm from the California Almond Growers' Exchange for experimental purposes, and informed by the exchange that they had none for sale. This was after the e lishment of the shelling plant in Sacramento, which was erected by the excha for the purpose of producing shelled almonds.

A very large percentage of the imported shelled almonds are used by manu turing confectioners, bakers, almond paste manufacturers, bread and cake bak chocolate manufacturers, blanchers and salters of shelled nuts, and various manufacturing industries.

On account of the many different kinds of manufactured products in which shel almonds are used, the manufacturers of these products require a very large var of shelled almonds.

To meet the requirements of these manufacturers about 12 varieties of shel almonds are imported.

California does not produce the varieties required for manufacturing purposes.

The experiments that manufacturers have made with California shelled alm have demonstrated that they are not suitable for manufacturing purposes, becau their fibrous nature and lack of flavor. When the California almonds are shel they lose their flavor and become hard and fibrous.

It is therefore very unfair to the manufacturers and to the consumers of th products to place an additional burden on these industries at a time when they the least able to bear it by increasing the import duties on shelled almonds 27 cent.

The argument has been advanced by the California Almond Growers' Exc that the increase asked for is necessary to protect the almond-growing industry senting an approximate investment of $50,000,000. We respectfully call th mittee's attention to the fact that the various industries that would be seriously by the proposed increase represent a capital investment of at least $1,000, The confectionery industry alone represents a capital investment of about $31

The total number of employees engaged in the manufacture of candy, which not include salaried officials, managers, office employees or salesmen, or the em of the jobbers and retailers, is approximately 76,000. The total number of em engaged in the industry is approximately 250,000.

The manufacturers can not increase their prices to such an extent as to co 275 per cent increase in the tariff, for the reason that there is an insistent d on the part of the public for lower prices and the consumers would refuse higher prices. The sale of products in which shelled almonds are used would th be reduced to a very great extent, to the serious detriment of the manufactur

We are not opposed to a reasonable increase in the tariff, but are absolutely to a 275 per cent increase

We believe that a tariff of 4 cents per pound on almonds in the shell and 6 cen pound on shelled almonds would be a reasonable increase and adequately se requirements as to protection and revenue.

We trust that our protest will receive your favorable consideration.

COCONUTS AND DESICCATED COCONUT.

[Paragraph 756.]

STATEMENT OF E. W. BROOM, NEW YORK CITY.

Mr. Broom. Mr. Chairman and gentlemen, on behalf of the erests I represent I would like to give you a few facts regarding siccated coconut.

The present rate of duty on this article is 2 cents per pound, which s the rate under the Payne-Aldrich Act and has not since been ered.

According to the schedule of the Fordney Act it is proposed to rease the duty on desiccated coconut to 4½ cents per pound, ich means an increase of 125 per cent.

To-day's market value of Ceylon desiccated coconut is about 9 its per pound in bond ex dock New York, so that the present duty 2 cents per pound represents about 22½ cents of the value of the oduct, whereas the proposed duty of 4½ cents per pound would resent about 50 per cent of the present value.

A duty as high as 4½ cents per pound would, in all probability, an greatly decreased imports and consequently less revenue.

From the point of view of protecting home industries, it is conled that the cost of labor in Ceylon, from whence the majority of ported desiccated coconut comes, is much lower than the cost of erican labor, but this is compensated for by the fact that Ceylon ive labor is very inefficient compared with American labor; also or-saving machinery and devices are used to a far greater extent the United States than in Ceylon, which further reduces the erence in labor costs.

Moreover, according to the "Survey of the American Coconut oducts Industry," prepared by the United States Tariff Commis-, recent figures from one of the large domestic manufacturers w a labor cost of $3.65 to $3.34 per 100 pounds, including office enses, or an average of about 3½ cents per pound. It is there- unreasonable for the domestic manufacturer to ask to be proted to the extent of 6 cents per pound, which rate they requested en they appeared before the Ways and Means Committee of the use.

Year after year the domestic manufacturers appear to have comed successfully with the Ceylon product, even under the present of 2 cents per pound, and presumably their trade has been unerative or they would hardly have continued to manufacture.

About a thousand people are employed in the domestic factories, hat a high duty would benefit less than one-thousandth of 1 per t of the population of the United States to the detriment of the ainder. In fact the desiccation of coconut does not economically ong in the United States any more than the canning of oysters ongs in an inland town.

On account of its fine flavor, long-keeping properties, and high ritive value Ceylon desiccated coconut is being used more and e every year by the large and small bakers, confectioners, and dy manufacturers of the United States. The majority of these

trades demand Ceylon desiccated coconut because of its desiccation from the nuts almost as soon as they come from the tree, thus insuring freshness. Furthermore, as it has to be dehydrated to a much greater extent than the domestic is dehydrated in order to preserve its quality on the long voyage from Ceylon, it is more adaptable to use by the baker, confectioner, and candy maker. This is one of the main factors in the constantly increasing demand for Ceylon desiccated coconut.

The domestic manufacturers use whole coconuts which have been shipped a few thousand miles, so that usually from two to four months elapse from the time of their coming from the trees to their being desiccated, which does not tend to improve the quality of the coconut.

A duty as high as 4½ cents per pound would not only work hardships on the consuming trades mentioned but would necessitate having to either advance prices to the public on their manufactured article or give the public a smaller piece of pie, cake, candy, etc.

Recognizing that increased revenues must be raised, the interests I represent, and in turn the consuming interests they represent, feel that they will be bearing their share of the increased taxation if the duty be increased from its present rate of 2 cents per pound (which was also the Payne-Aldrich rate) to 3 cents per pound, which would represent an increase of 50 per cent and also represent a rate of about 33⅓ per cent based on the present import value of Ceylon desiccated coconut.

We therefore suggest that paragraph 756 of the Fordney tariff act, desiccated coconut, be altered to 3 cents per pound.

STATEMENT OF FRANKLIN BAKER, JR., REPRESENTING THE FRANKLIN BAKER CO., PHILADELPHIA, PA.

Senator McCumber. You may state your name.

Mr. Baker. My name is Franklin Baker, jr.

Senator McCumber. You desire to discuss the same subject that was discussed by Mr. Broom?

Mr. Baker. I desire to discuss the same subject, but from a different point of view. Instead of championing the Singalese from Ceylon I am championing the manufacturers of the United States.

I want to say that I import coconuts that come from the American Tropics. I manufacture from coconut what is known as prepared or desiccated coconut. To give you a little idea of the value of the business, the United States imported last year 90,000,000 nuts and about 33,000,000 pounds of the desiccated nuts. The tariff under paragraph 756 of the House bill gives a duty of half a cent each on coconuts and 4½ cents per pound on desiccated.

First, I want to point out the relativity of coconut to desiccated coconut. It takes three coconuts to make one pound of desiccated coconut. That means that the half cent duty on coconuts really means 1½ cents as a compensatory duty on desiccated coconut. Therefore the net result is 3 cents, which is our protective duty, and that is the chief thing we are interested in. The question of duty on coconuts and desiccated coconuts, no matter how big or little it may be, only concerns us as far as the protection of our own industry is concerned.

I want to point out to you that in the year 1909, when the Payne-drich bill was passed, there were only about 2,000,000 pounds of ylon desiccated coconut imported. The amount was negligible. made but little difference whether the duty was 2 cents or what was. In 1913, when the Underwood bill was passed, it was still ents, and that year there were imported 6,000,000 pounds. Since in the industry has been growing in the island of Ceylon, carried by the Singalese manufacturers and the English who are repre-ited there, and the business in this country has been gradually ing backward. Last year instead of importing 2,000,000 pounds, is country imported 33,000,000 pounds. Within the range of these iffs there have not been any new concerns starting up in our busi-ss; two have failed, and I am told another is going out of business cause it is unprofitable. I have spent a good deal of money in ilding up this business, and I feel it is worth protecting. The nual volume of trade represented in the United States is only out $10,000,000, but there are several million dollars of capital vested in the industry.

Senator SMOOT. What does it cost you in labor to produce the siccated coconut from the coconut?

Mr. BAKER. The actual labor charge is 3½ cents a pound, with no erhead, steam, rent, administrative expense, or anything. That the actual cost, the labor charge.

Senator SMOOT. And you want 3 cents?

Mr. BAKER. I want 6 cents.

Senator SMOOT. Six cents to cover——

Mr. BAKER (interposing). Overhead, packing, field and shipping oor.

Senator SMOOT. The foreigner has overhead and packing the same you have. You do not want the full amount of the labor cost, you?

Mr. BAKER. No.

Senator SMOOT. You are asking for it, within half a cent.

Mr. BAKER. I can give details to show we are not.

Senator SMOOT. If it takes three coconuts to make a desiccated conut, that is 1½ cents. That leaves 3 cents protection to labor. u say the labor cost is 3½. You are asking for the whole labor st, practically.

Mr. BAKER. It means more than three and a half, because you ist consider the factory charge. You asked for the labor charge. u should have asked for the manufacturing charge, which is about cents, of which 3½ cents represents the actual labor charge. The oor charge is higher than in Ceylon. In Ceylon they have a labor arge of 1 rupee a day, 28 cents, against our $3 or $4.

Senator SMOOT. Your labor could not amount to more than 3½ nts outside of the overhead charge.

Mr. BAKER. Three and a half cents actual manufacturing labor only.

Senator DILLINGHAM. What do you mean by "actual labor?"

Mr. BAKER. The chief labor is shelling and paring of the nuts, id such as that, all labor.

Senator SMOOT. Without any overhead expense?

Mr. BAKER. No; no superintendence charges or other charges.

Senator SMOOT. And those other charges cost you 2 cents?

Mr. BAKER. The other charges cost about 2½ cents with the

superintendence. Eliminating the superintendence it would be ab[illegible] 2 cents. The packing would be the same in both countries.

Senator SMOOT. We want to give you ample protection, but [illegible] not want to give you all your labor. If we did, your labor would no[illegible] cost you anything compared with a foreign country.

Mr. BAKER. The brief which I will present will show you th[illegible] difference between the cost of these goods made in Ceylon an[illegible] America is about 6 cents a pound. These figures have been take[illegible] over a number of years, showing the imported cost of the goods [illegible] the other side, as compared with our own.

Senator SMOOT. We can get it from the brief.

Mr. BAKER. One point I wish to bring out, and one of the prin[illegible] cipal points I wish to call attention to, is that we have not share[illegible] in the excess profits of the last few years in this country. I poin[illegible] that out to show that we are doing this whole business on a bas[illegible] of less than 5 per cent. I average less than that. Last year w[illegible] had a loss. It is impossible to compete with the manufacturers [illegible] the other side.

Furthermore, even though this duty should be made higher, n[illegible] matter how high it might be, the actual cost of the goods to the co[illegible] sumer, the baker, or confectioner, whoever may use it, is negligib[illegible] because there is only about two-thirds of a pound of coconut co[illegible] sumed per capita. The amount of goods going into the average co[illegible] fection or cake is only 7 per cent and only means about a qua[illegible] ter of a cent per pound. When you figure it down, it amounts to [illegible] negligible quantity.

Furthermore, inasmuch as the supply of coconuts in the W[illegible] Indies is not large enough to take care of all the demand in this cou[illegible] try, there is bound to be continued importation of desiccated co[illegible] nut from Ceylon, which will come in irrespective of what the du[illegible] may be, because a few cents a pound more or less on the product [illegible] desiccated coconut is not going to have any material effect on t[illegible] sales.

BRIEF OF THE FRANKLIN BAKER CO., PHILADELPHIA, PA.

I. Our interest is in paragraph 756 of the tariff bill as passed by the House, wh[illegible] reads as follows:

"Coconuts, one-half of 1 cent each; coconut meat, shredded and desiccat[illegible] similarly prepared, 4½ cents per pound."

This does not give us the protection required in order to maintain our busin[illegible] against foreign competition.

II. The average yield of desiccated coconut from 1,000 nuts is 330 pounds, tha[illegible] 3 coconuts make 1 pound of desiccated. Hence, the compensatory duty allow[illegible] desiccated coconut for the duty of one-half cent each on whole coconuts is 1½ cents [illegible] pound. Therefore, the actual protection we are receiving against imported desiccat[illegible] coconut under the present bill is (4½ cents less 1½ cents) 3 cents per pound. We w[illegible] to invite your particular attention to this fact.

III. Here are figures that tell their own story and have an important bearing [illegible] the subject.

	Pounds of goods imported.	Average importation value per pound	[illegible]
1917	9,702,785	$0.1082	[illegible]
1918	20,269,909	.1496	
1919	29,637,673	.1873	
1920	32,920,614	.1794	

The present c. i. f. value of the imported article is about 9 cents per pound and the sent domestic cost about 15 cents per pound.

V. These figures show that the difference between the laid-down cost in New York the imported article and the manufacturing cost of the domestic article averages cents per pound. Therefore, a duty of 6 cents per pound should be placed on iccated coconut in addition to any compensatory duty that may be granted due the placing of a duty on whole coconuts. This duty of 6 cents a pound we ask in er that our industry may be put upon an equal footing with our foreign competitors the American market.

. When the Payne-Aldrich tariff was passed the duty was made 2 cents per pound l coconuts came in free. At that time the imports were negligible and no request made for an increase in tariff. Since 1913 the domestic manufacturer has not n able to increase because of the competition of the Singalese manufacturers. e Payne-Aldrich bill of 1909, therefore, does not serve as a proper standard for ty rate. passed at a time when the imports of desiccated coconut were less than 00,000 pounds per year, and framed without representation of the domestic manuturers at the hearings.

VI. Since that time the foreign competition has constantly increased. Even in 13, at the time of the framing of the Underwood bill, imports were only 6,500,000 unds per year, and they were not a serious menace to the desiccated manufacturer. e import figures for 1920 of 33,000,000 pounds speak for themselves.

VII. The industry in the United States represents an investment of several million lars and an employment of nearly 2,000 men and women.

There is a considerable labor problem in the preparation of desiccated coconut, as lled labor is required to take off the shells and the brown skin that is over the kernel the nut.

The manufacturing process consists chiefly in the shredding and drying of the conut. The chief essential in all this work, in dealing with a product that is apt spoil readily, is an absolutely clean, sanitary plant. Furthermore, working under r health and pure food laws makes the cost of goods in this country materially higher an in the Island of Ceylon.

The number of pounds of desiccated coconut produced in this country has increased ry little in the past few years. The demand for the article has increased enormously, d this increased demand has been supplied by the imported article, which could sold at much lower price due to cheap labor conditions in the Island of Ceylon, ere all the imported goods are manufactured.

VIII. Labor in Ceylon is paid 1 rupee per day against our present wage of $3 to $4 r day. A rupee on the basis of to-day's exchange is about 28 cents; in normal nes it is worth 40 cents. Granting that it takes two Singalese to do the work of one merican, the rate for the same unit of work is only 56 cents as against $4 in America.

IX. The sales price of the imported article to the bakery and confectionery trade day (duty paid) is 11½ cents. Our sales price is 16 cents, and it is only because of r better quality that we are able to get any business whatsoever. It is impossible us to compete under present tariff conditions. The domestic manufacturer has t increased his business, whereas there are more mills going up in Ceylon each year.

X. An increase in the duty to 6 cents per pound will not materially affect the price the consumer of articles containing desiccated coconut. An analysis made by a sinterested laboratory of 11 bakery products containing coconut shows an average conut content of 7 per cent. An increase of 4 cents per pound in duty would only stify raising the selling price per pound on these products by an average of slightly ore than one-fourth cent per pound. The per capita consumption of desiccated conut in this country is less than two-thirds of a pound per year, and it is our belief at the very slight advance in the sales price of desiccated coconut to the confeconer or baker is not material, as almost all other nuts sell for considerably more. ere is, therefore, no reasonable ground for opposition to our request from the makers bakery and confectionery products.

XI. An increase in the duty on desiccated coconut would not curtail imports for e reason that there are not enough coconuts in the West Indies to supply the demand, d desiccated coconut will be imported in as large quantities as heretofore. Hence e increase in duty will bring an increase in revenue.

XII. The tariff bill, as it passed the House, gave to our industry a protection of ly 3 cents per pound, whereas the actual difference in the cost of Ceylon goods at cents, as against our cost of 15 cents, is 6 cents per pound. To have full protection desiccated coconut, we should be given 6 cents a pound, and without being comelled to pay a duty on coconuts.

XIII. This difference of 6 cents is made up not only in the manufacture of the desicated coconut but also by the difference in cost of production of coconuts. Our manu-

facturing cost of over 5 cents per pound is at least 4 cents higher than the product m in Ceylon. Because of the cheap field labor, which is paid one-half rupee per da, 14 cents, against our West India labor of 50 cents to $1 per day, the raw materia one-third cheaper, which in itself gives a variation of several cents per pound, figu in terms of desiccated coconut. Unfortunately we can not avail ourselves of t cheap coconuts because they would spoil in the long transit.

XIV. If the duty on coconuts should be omitted, the full revenue required ca obtained from the increase in duty on desiccated coconut, and it would be easier collect on the uniform weights of import cases of desiccated than on the coun coconuts, which come in bulk and in bags of various sizes and counts. Neither w you be justified in placing a duty on coconuts by weight, for the weight give measure of the meat content, and would be subject to even greater difficulties th taking them by count.

Outside of the protection to our own industry, there may be considered the bear it has on our neighbors in the American tropics, whose only market for coconuts is United States.

PEANUTS.

[Paragraph 757.]

STATEMENT OF W. H. KELLY, REPRESENTING THE KELLY CO CLEVELAND, OHIO.

Mr. KELLY. I would like to say, gentlemen, that I am the first to appear before these committees representing a jobber and man facturer of peanut products. Those who have appeared before committee seem to represent associations and are the secretarie those several associations. These associations claim to represent t farmers to a certain extent. They represent themselves and t shellers and cleaners.

I was at a meeting here in Washington some several months a I was called down here by a number of people who operate shell and cleaning factories in the South. They wanted to know what m position was in regard to a higher duty. I told them I was in fav of a protective tariff; that I was a Republican and was for protecti and was glad to welcome them into our camp of protection I ask them what their ideas were in regard to a duty. They said they wo like to get 3 cents. I told them that was much too high, and if th could get 1½ or 2 cents it would be extreme.

They told me at that time that 2 cents would be entirely satisfa tory, but that they were going to ask for 3 cents in the hope getting 2.

I did not appear before the Ways and Means Committee before emergency tariff bill was passed, and had no opportunity to appe before that committee at its last meeting. This is the first oppo tunity that I ever had to appear before any committee in Washingt We are glad to have them get the protective-tariff fever down Georgia and Alabama and Virginia. It seems to be the first time th ever had the fever, and they have sure got it strong and have g delirious this time. They are now asking for 3 or 4 cents, which practically no protective tariff, but a stone wall.

What we buy in the way of imported peanuts is the large kern which comes from China, counting 28 to 30 to the ounce and 30 to to the ounce. These peanuts are not produced in Virginia in an great quantity. It is impossible for us to buy the quantity require It is necessary to buy these selected peanuts——

Senator LA FOLLETTE. Just a moment. If they can be produ at all, why can they not be produced in quantity?

Mr. KELLY. The best that they have produced in Virginia is about 2 to the ounce and a limited quantity. The crop this year is estiated at 1,250,000 acres in the South. Of that quantity 1,000,000 cres are devoted to the Spanish peanuts, and these are the small ariety kernel, and 200,000 acres consist of the Virginia white peanut, nd this variety is marketed in the shell and not shelled in quantity. hese are sold largely in the shell. There is a very limited quantity f large kernels. It would not pay them to shell these Virginia eanuts in large quantities to get enough of those large kernels, ecause they would be unable to dispose of the small kernels in eat quantity.

Senator SUTHERLAND. Do you buy them shelled?

Mr. KELLY. Yes, sir. We buy the kernels. We buy nothing in le shell that is imported.

If I may file a brief I will cut my remarks down just as short as ossible.

Senator MCCUMBER. That may be done.

Senator DILLINGHAM. What is your business—preparing them for arket?

Mr. KELLY. We prepare them for market. We make salted peants and peanut butter and other peanut products.

The prices this year are ruling low for peanuts. The farmers got g money for their peanuts the last several years and made big oney the same as the rest of us; we all made big profits the past two ears. So far as I am concerned, Uncle Sam took part of it and I lost le rest of it by buying peanuts.

The farmer is lucky this year in the South who grew peanuts. He is ot compelled to dump his peanuts like the gentleman who just stified did with his onions. You will find the peanut market report owed that 140,000 and some odd bags held over from last year. he peanut crop has been consumed so that there was but 10 per cent that crop on hand some time in August. The gentlemen are right ere in the room who made these statements. I received from Pretw Peanut Co., Franklin, Va., this letter in August:

> The demand for both of these grades is certainly improving, and we believe before the d of September the price will be much higher on account of the limited supply; we erefore advise keeping your requirements covered. Just as soon as you are interted let us have a wire. We will surely try to make the price attractive.

The Donaldsonville Oil Mill, of Donaldsonville, Ga., said:

> The farmers stock of Spanish is very rapidly diminishing and only a few car lots are ill being held in this section.

In a statement before the Ways and Means Committee it was aimed that there had been no market for the peanuts and that they ould not sell them. It is true business was quiet; we all had stock n hand we could not sell and move to advantage, and there is no uestion but what the farmers sold a lot of their peanuts at a loss. 'e did last year and we did this year. I bought a lot of peanuts in eorgia this year and lost a dollar a bag on them. The farmer is head that dollar a bag.

Again the Donaldsonville Oil Mill, under date of August 24, this ear, had this to say:

> We shelled more peanuts last season than any single plant in the southeast, and are ell equipped to take care of your orders at all times and assure you that they will ceive our very best attention.

I will just give you the substance of these. The balance of t... simply elaborate.

I believe Lem P. Jordan is in the room. He said under dat... August 6:

There is less than 10 per cent of the crop unmilled as of this date.

That shows that the present crop has been used this year, inclu... the 140,000 bags held over from last year.

The Suffolk Peanut Co., under date of August 25, said:

Inclosed you will find confirmation of our message of this date. We regret t... are unable to offer Virginia shelled, as our stocks are entirely exhausted at th... and we can make no further offerings until we can secure additional stock.

Mr. Pinner, of the Suffolk Peanut Co., is in the room.

Mr. Bain, of the American Peanut Corporation, is present. ... said under date of August 26:

The market is very much stronger and stocks on shelled goods are getting l... and the demand is also better on all grades for the past few days.

That in substance covers the peanut situation. I have ... given a few of the high points.

I claim that if they get 1½ cents duty on peanuts it will be su... cient to keep out all low-grade peanuts. We want an opportu... to import these large kernels running 28s to 30s to 32 per ounce

Senator La Follette. What do you mean by 28s to 30s?

Mr. Kelly. That is the number of kernels to the ounce.

They talk about peanuts growing in Gambia, British India, B... mah, the Straits Settlements, and through that section of the wor... Those peanuts can not be used in this country by the manufactur... and jobbers to advantage; in fact, they can not use them in pean... products and turn out a decent product. You can not bring ... peanut through the Tropics, because it will soon get rancid.

You submit the peanut to a high temperature and the oil p... are opened up and the nut will turn rancid. Senegal and In... and Gambia peanuts are all of very low grade. You can not mak... peanut butter out of them and they can not be used for cand... The only peanuts you could import here are the Spanish shel... from Spain direct. But they are ruling high, and it has been a gre... many years—at least 15— since we have been able to bring an... from Spain. Referring to the statement that Senegal peanut... Gambia peanuts and African peanuts, British India peanuts co... in, they come in in very small quantities and will always be broug... in by some one who would be classed as a "tenderfoot" in the b... ness, who would bring the peanuts in and find out they were diff... ent grades after they got here and would lose money. The sta... ment was made that no peanuts were brought in through Engl... from India. We bought peanuts in London 15 years ago and fo... them unsatisfactory.

Senator La Follette. What is the production of peanuts?

Mr. Kelly. One million two hundred and fifty thousand a... are being grown this year.

Senator La Follette. In pounds, what does that mean?

Mr. Kelly. That I do not know. You have the Governm... figures here. Mr. Bain can tell you. Do you know how m... were produced?

Mr. BAIN. We have the Government's report on that, and we have r estimates.

Mr. KELLY. You do not know what the total crop is?

Mr. BAIN. We think from 35,000,000 to 52,000,000 bushels.

Mr. KELLY. I am in favor of a duty that will protect the farmer, d I have got just as much sympathy for the farmer as anyone. t it is folly to try and put a 3 or 4 cents duty on peanuts. will simply prevent us from importing a few that they do not oduce in Virginia. They are not going to shell up the peanuts m that 200,000 acres of the white peanuts, and that is all they oduce there; and what they do shell is the broken or discolored lls or otherwise damaged, as these nuts are worth more in the ll. That I know. I will be pleased to submit a brief.

RIEF OF W. H. KELLY, REPRESENTING THE KELLY CO., CLEVELAND, OHIO.

'e wish to protest against the proposed duty of 3 cents on unshelled peanuts and nts on shelled peanuts.

ractically all of the peanuts that are imported under normal conditions are the e kernels that can be selected from the Chinese crop.

he American crop amounts to about 1,250,000 acres at the present time. All pt about 200,000 acres are the small Spanish or runner variety and all are shelled the market. The 200,000 acres of larger variety is what is called the Virginia te. These have a much larger shell and kernel than the Spanish variety and e of the Spanish variety is ever imported.

he only Virginia white peanuts that are shelled are the damaged nuts and in shell-these a few large kernels are secured, but not enough to materially interest buyers. extra price that the shellers get for these few large kernels compared to the total ery small, the balance of them shelled are called "No. 1 Virginia Shelled," and trade is limited.

hat the present crop (1920) made a loss is without question, but this crop was made high cost. The 1921 crop now growing will be made at a much less cost. Mr. ier stated before the Ways and Means Committee that peanuts cost 6 to 7 cents pound to produce.

he Alabama Market Journal of Montgomery, April, 1921, states that the cost is per bushel (a bushel of Spanish peanuts weighs 30 pounds) or 3.9 cents per nd, and these costs were figured on high cost of labor and fertilizer.

e favor protecting the American farmer but do not want to see a near prohibitive in the proposed tariff bill.

e will import a few of these large kernels for the high-price trade, but sale will liminated from syndicate and chain stores, where goods are sold at a small profit. peanut is the only poor man's nut.

at a crop will occasionally make a loss to the grower is quite true, but we all bad seasons.

e 1920 crop would have sold at a profit had the pay roll of the country been as as in past seasons. You know of the present unemployment and lack of buy-power on the part of the people.

out 50,000,000 pounds of Chinese peanuts have been brought in this year, and ly all received before the emergency tariff bill enforced. Can also advise that it cessary to bring the large kernels in during the winter and spring months, and nuts are then put in cold storage. Otherwise the stock would get rancid and ny.

anuts never carried a duty of over 1 cent in past years, and no amount of small were imported until the last few years, when we had war conditions, and at time the grower was paid from two to three times the price paid during normal itions.

r claim is that a duty of 1½ cents per pound is extreme and very high for shelled uts, and under this duty only large kernels can be imported, but this proposed duty would mean practically no importations, and the business built up in past s would be destroyed, with a big loss of revenue to the Government and no appre-e gain to the American peanut growers, as the importation of these large nuts not conflict with his interests.

STATEMENT OF JOHN B. GORDON, ALEXANDRIA, VA., REPRESENT- ING PEANUT CRUSHERS AND VEGETABLE-OIL REFINERS.

Mr. GORDON. My name is John B. Gordon; I live in Alexandri Va. I speak for the peanut crushers and the vegetable-oil refiners.

I am glad that the gentlemen who want high duties on all kin of peanuts are in the room, because I would like to add a remar to that of the gentleman who has preceded me, which is that the ge tlemen who have been speaking before this committee and the Way and Means Committee and who claim to represent the grower and who also state that they represent the peanut crushers, do n represent the crushers, but represent only themselves. The crushers peanuts have interests which are diametrically opposed to those the peanut shellers, and it would be like having a German plead th cause of the Frenchmen to have the shellers who are represent by these gentlemen plead the cause of the crushers of peanuts; a if these gentlemen do represent any crushers of peanuts, they repr sent those such as the Donalson Oil Mill, whose letter the preced speaker read from, who have abandoned crushing for the mo profitable shelling and grading of nuts for the edible-nut tra crushing perhaps a few culls and unsalable refuse.

The game of the sheller is to keep the price of the peanuts jus little bit above the height a crusher can reach, and if they can that they are happy. And if they can put the crushers out of bu ness, it would be a blessing to them but to nobody else. It wo not assist the southern farmer, the grower of peanuts, and it certai would not do the vegetable-oil industry of this country any good.

I appear to request the free entry of peanuts for crushing p poses, with proper and suitable duties upon those peanuts which to be used for edible purposes; that is, those peanuts which are to supplied to the nut trade or the roasters and salters, the confecti and baker, and the peanut-butter makers. These peanuts comp with our domestic peanut, while the crushing peanuts do not.

The proposed duty of 3 cents per pound on the unshelled pea and 4 cents per pound on the shelled is prohibitive when we cons it in its relation to the oil content of the peanuts and the pro of using imported peanuts for crushing purposes, because there be a tax of about 10 cents per pound on the resultant oil, whe the normal value of peanut oil is only about 5½ cents to 7 cents pound.

Senator LA FOLLETTE. What is the oil used for?

Mr. GORDON. The oil is used in the manufacture of lard sub tutes, in the making of salad oils, in the packing of sardines, in ma certain cooking fats, in the making of soaps, and about 3 to 7 cent of the total vegetable and animal oils used in the manufactur oleomargarine is peanut oil.

The uses are quite diversified and the market of the refine is of such specialized nature that it requires a considerable competent sales force to seek out all of the different outlets, th being quite a few different uses.

The domestic peanut industry is a nut industry and not a industry. The figures which I will give you to support this state are those procured from the Government and appear in all records, and therefore are not subject to argument and ca readily verified.

In 1920 less than 4.1 per cent of the domestic peanuts available ›re used for oil-producing purposes. In 1921 to date less than 2.1 r cent of the peanuts available have been used for oil-producing ırposes.

Senator LA FOLLETTE. Are those figures obtained from the Agri- ltural Department.

Mr. GORDON. The figures which the percentages are based upon are e amounts of peanut oil produced in the United States which are ren by the Department of Agriculture and other Government de- rtments and applied against the total domestic production of anuts and also the total importations of peanuts. That will be vered in more complete detail in a brief which I will file.

The 1919 crop of peanuts was 33,925,000 bushels; apparently less an 4 per cent of those peanuts were used for crushing purposes. I y "less than 4 per cent," because there came into the country spite the duty a certain amount of foreign crushing peanuts, and m those foreign peanuts some oil was made. There are no figures ich show how many foreign peanuts were used in producing peanut . The domestic peanut oil produced is made from both domestic d imported peanuts.

The 1920 crop consisted of 35,960,000 bushels, of which less than ›er cent has been used up to July 1 in the production of oil.

The reason that the American peanut industry is a nut industry d not an oil industry is that the peanuts will bring a much higher ice when sold to the edible trade, which is represented by the ntleman who spoke before me, than if turned into oil. That is a ief reason why the domestic production of peanut oil is dwindling d not the competition of foreign vegetable oils and the competi- n of foreign peanuts. The peanut crusher can not afford to crush domestic nuts and the duty won't permit him to buy foreign shing stock.

On to-day's market the sheller of peanuts can get 5¼ cents per und for No. 1 Spanish peanuts. That would be around $75 a ton it he would realize on 1 ton of farmers' stock of Spanish peanuts. w, if you turn those peanuts into oil they would not produce more in $56 worth of product, which includes the oil, the cake and hulls, d any other by-products So you can readily see it is much more ofitable for the nut trade to use the domestic peanuts than it is the crushing mills.

I desire to call attention to an incorrect statement which one of the ntlemen who testified at a previous hearing on peanut oil made. lo not know whether it was intentional or not, but he stated that emergency tariff had raised the price of the farmers' crushing anuts. He stated that the farmer was able to get somewhere in neighborhood of $40 a ton for his crushing peanuts when the ergency tariff went into effect and that he could now get from $50 $58 a ton. That gentleman did not state that while those peanuts ght be called "crushing peanuts," they were not bought for crushing rposes, but are being sold to the edible trade; the crushers can not ord to use them So he should have explained his statement in re complete detail; also he should have stated that the peanuts uld have normally increased in price about this time of the year matter what purpose they were being used for.

The people who will suffer most if the crushers of peanuts in this untry are cut off from all sources of crushing peanuts are not the

crushers so much as it will be the domestic grower or the pean farmer. The peanut crushers of this country are primarily cott seed crushers. The crushing of peanuts with these cottonseed mills is perforce more or less of a side line, because they have n been able to get enough domestic peanuts to make a steady busin of it, and they have not been able to import foreign peanuts beca of the existing duty.

The farmer, if the crusher is allowed——

Senator LA FOLLETTE (interposing). What do peanuts run weight to the bushel?

Mr. GORDON. About 30 pounds would be taken for the kind peanuts that are crushed for oil; they run from 22 to 30 pounds. b the lighter ones are not used for oil.

Senator LA FOLLETTE. We brought in 42,000,000 pounds of p nuts this year, ending June 1.

Mr. GORDON. My figures are for calendar years, but 42,000 pounds would be something over 1,400,000 bushels on the unshe basis, which were largely used for edible purposes.

Senator LA FOLLETTE. I do not know what they were used for

Mr. GORDON. The use to which they are put is very appar You need only take the domestic production of oil and apply against the domestic production and importations of peanuts——

Senator LA FOLLETTE (interposing). What was the production peanut oil this year and last year?

Mr. GORDON. The domestic production of peanut oil last year only about 13,000,000 pounds. For the first six months of this y it was about 6,000,000 pounds.

You can apply that production of oil against the total dom peanuts available, and you can see that last year from all the avail peanuts they did not crush 4.1 per cent, and when you apply th production of the first six months of this year against the pea available it does not amount to 2.1 per cent.

Senator LA FOLLETTE. How much in weight does a bush peanuts yield in oil?

Mr. GORDON. It will yield about 1 to 1¼ gallons.

Senator LA FOLLETTE. And that weighs about how much?

Mr. GORDON. A gallon weighs about 7½ pounds. The farmer at the present time three outlets for his peanuts. The first and profitable is the sheller and cleaner, who sells them to the nut t the second is the peanut crusher; the third, he can feed them to hogs.

Naturally it will not take much of a price to beat feeding th hogs, but if the crusher is put out of the running through not able to secure a supply of raw material when there is a short cr this country or when there is a specially heavy demand from the trade the farmer has only two outlets left—he has the edible and he has got his hogs—and the domestic crusher will have t trying to crush peanuts if we don't allow him to import his cru peanuts.

So you can see it is to the material advantage of the sheller supplies the edible nut trade to put the crusher out of busines not, as he professes, to prolong his existence.

The present duty of three-eighths and three-fourths cent per p on the unshelled and shelled peanuts, respectively, means of 1.3 to 1.7 cents a pound on the oil, which figures 20 to

nt ad valorem, on a basis of peanut oil worth 6½ cents a pound, iich is a prohibitive tax, because by observation of the movements peanut oil into this country under the existing permanent duty on anut oil of 6 cents a gallon, which on 6½-cent oil is about 12 per cent valorem, it will be seen that not until peanut oil reached a price of out 15 cents per pound, double the normal value, under the luence of war conditions, did peanut oil begin to come into this intry in any volume. In other words, the present duty on peanut , under normal conditions, while not a total embargo constitutes a y strong barrier against the importation of peanut oil.

It was not until peanut oil got up to 19½ cents per pound that the ivier importations of peanut oil were made into this country.

The basic difficulty in the manufacture of peanut oil from domes- peanuts is that peanut oil is completely interchangeable with cot- iseed oil. You can rarely get more than one-eighth to one-fourth its per pound more for peanut oil than you can for cottonseed oil. erefore, no duty will increase the price of domestic peanut oil, ause our 4,000,000 barrels of domestic cottonseed oil production he regulator of price.

The reason we request the free importation of crushing peanuts is ed upon that very fact, because peanut oil, whether made from nestic or imported peanuts, must compete with cottonseed oil, ich is the product of a by-product of the growing of cotton. We st make peanut oil sufficiently cheap that it can compete with tonseed oil, and that is a difficult task because peanuts are a main p while cotton seed is a by-product. If peanut oil can not com- e with cottonseed oil in price it can not be sold and it can not com- e when the crushing peanuts imported bear a duty.

will submit a brief and cut my remarks short; and, Mr. Chairman, as also requested to submit a brief upon the ratio between a duty flaxseed and a duty on linseed, not in protest of the duty upon seed but to show the proper difference between the two.

enator McCUMBER. That may be done.

F OF JOHN B. GORDON, ALEXANDRIA, VA., REPRESENTING PEANUT CRUSHERS AND VEGETABLE-OIL REFINERS.

luty of 4 cents per pound on shelled peanuts and 3 cents per pound on unshelled uts is proposed in the Fordney tariff measure. This means that peanuts will be rted only for edible purposes and that none can be imported for crushing purposes : proposed duties are adopted.

: shall petition in this brief, therefore, the free entry of peanuts for crushing ses upon submittal of proper affidavit by the importer that the peanuts so im- d are to be used for crushing purposes in the production of peanut oil and for this se solely.

is not to be in anyway construed that we advocate the free importation of edible its as used by the nut trade, as this brief relates solely to the advisability of the ntry of peanuts for crushing purposes.

: fully indorse the policy of levying such duties as are compatible with normal s, conditions of reciprocal trade with the countries from which the imports come, related matters, upon imported peanuts sold in competition with our domestic ut to the confectioner, the roaster, and the peanut-butter manufacturer, which constitute the "nut trade" in peanuts. We shall in this brief prove that the ntry of crushing peanuts will in no wise be injurious to the domestic peanut try but will, on the other hand, be beneficial to it.

POSED DUTIES PREVENT IMPORTATION OF PEANUTS FOR CRUSHING PURPOSES.

e proposed duty of 3 cents per pound on unshelled peanuts equals 90 cents per el or $60 per ton. A ton of unshelled crushing peanuts will yield 600 pounds anut oil. The tax on the oil in these would amount to 10 cents per pound, or

75 cents per gallon, which is 69 cents per gallon more than the existing duty on peanut oil as established in the act of 1913. To the tax on the oil the domestic crusher must add his labor cost, which will generally run in the vicinity of 5 per cent of the value of the finished products, fuel, power, and other charges of direct and indirect nature. Inasmuch as the normal value of peanut oil ranges from 5 to 7 cents per pound, it can be seen that it would be impracticable to produce peanut oil from imported peanuts in a commercial way should the proposed duty be enacted into law.

THE DOMESTIC PEANUT INDUSTRY IS A NUT INDUSTRY AND NOT AN OIL INDUSTRY.

It is the knowledge of the fact stated in the above subhead which prompts [illegible] request the free entry of peanuts for crushing purposes.

While there have been produced each year for the past five years domestic crops of peanuts ranging from thirty-three to fifty-two million bushels of peanuts, at no time has more than one-fifth of the crop been used for oil producing purposes, while last year (1920) less than 4 per cent was so used, and during the first six months of the present year only about 2 per cent of the domestic nuts had been used for oil producing purposes.

We give below a table in which are shown the domestic production of peanuts, the potential oil yield of these peanuts, the imports of peanuts, their potential oil yield, the actual amounts of peanut oil produced, and the percentage which same represents of the domestic and imported peanuts, as used for oil-producing purposes. In this table we have considered that the domestic peanut crop of each year would be harvested in the late fall and crushed in the following year and therefore have applied the Government figures as to oil production of a given year against the domestic peanut crop of the previous year. In considering the possible production of oil from imported peanuts, however, we have taken it for granted that peanuts imported during a given calendar year would be crushed in that year. These methods of figuring may create minor inaccuracies in any one year's figures which will be equalized when the average of several years is considered. Inasmuch as the Government figures do not discriminate between peanuts imported for oil and those imported for edible purposes, it is impossible to state even approximately how much of the oil shown as produced was made from the domestic peanuts and how much from the imported peanuts. In figuring the oil yield of peanuts we have considered the yield of 1 bushel of unshelled nuts as 1¼ gallons, which is sufficiently accurate for all general purposes and for estimates. The weight of a bushel of peanuts is taken at 30 pounds in transposing pounds to bushels, and the amount of meats is figured at 70 per cent.

TABLE 1.—*Domestic production and import of peanuts, with potential oil yield [illegible] estimated per cent used in production of peanut oil.*

Year.	Bushels.	Potential oil yield in pounds.	Actual peanut oil produced in following year.	Maximum per cent domestic crop required [illegible] each year production oil
Domestic production:				
1916	34,433,500	322,814,000	50,[illegible],000	[illegible]
1917	52,505,000	492,234,000	95,934,000	[illegible]
1918	46,010,000	431,341,750	87,217,000	[illegible]
1919	33,925,000	318,046,000	13,086,000	[illegible]
1920	35,960,000	337,325,000	6,825,000	[illegible]
Total	202,833,500	1,901,760,750	[1] 253,321,000	......
Imports:[2]				
1917	2,099,313	19,681,057	....	......

1921	[3] 1,358,232	12,733,425	....	......
Total	11,023,542	103,345,711	....	......
Grand total	213,857,042	2,005,106,461	....	......
Average per cent of domestic and imported peanuts used in production of peanut oil	....	....	....	[illegible]

[1] Oil yield from imported peanuts included in above.
[2] Equivalent in bushels of unshelled nuts.
[3] Represents first 6 months 1921.

rom the above table it will be noted that the crushing of peanuts in America has dly been subordinated to the more profitable task of supplying the confectioner, peanut roaster, and the peanut-butter manufacturer with nuts for their several le products.

e have previously pointed out that it is not possible to state how much of the estic oil produced is derived from imported peanuts. However, it is known that ng the past two or three years entire ships' cargoes of crushing peanuts have been hased by the cottonseed-peanut crushing mills in Texas and the Southeast and ed into oil. While the volume of foreign peanuts so used is relatively small n compared to the total quantity of peanuts available it can be safely said that domestic peanut oil produced during 1919, 1920, and the early part of 1921 to a large degree, expressed from imported peanuts. The latter observation ies particularly to the peanut oil produced during 1920, when about the only estic nuts used for crushing purposes were a few low-grade nuts along with trash other refuse from the shelling and cleaning plants. It is likely, therefore, that in of a probable 4.1 per cent of the crop of 1919 being used for the production of ut oil that not half that quantity went to the crushing mills.

will further be noted that when the domestic production and the importations of uts are considered jointly that even then the average maximum percentage used he production of oil remains quite small being only 12.6 per cent for the several s.

e lessening volume of domestic peanut-oil production in America must not be ny way confused with the importations of foreign peanut oil or the conclusion ed that a high tariff on imported peanut oil will in any way assist the domestic uct. There is no tariff problem involved other than that which is set forth in brief which is that the confectioner, the roaster, and the peanut-butter manu- rer use up all the domestic nuts and the crusher is unable to utilize the imported to the large degree he otherwise could because of the duty imposed.

e foregoing is set forth in our brief on peanut oil printed in the report of the ngs on Schedule 1, paragraph 50, before the Senate Finance Committee.

is in its competition with our domestic cottonseed oil that domestic peanut oil an almost impregnable barrier against the really extensive development of a stic peanut-oil industry and will so long as the pseudopeanut-oil industry of this try is forced to depend upon the intangible prospect of securing domestic peanuts ush, a condition enforced by the existing duty upon peanuts which does not iminate between those used for crushing purposes and those used by the nut .

MESTIC PEANUT OIL FORCED TO COMPETE WITH DOMESTIC COTTONSEED OIL.

anut oil and cottonseed oil are completely interchangeable. Peanut oil, there- is continually in competition with cottonseed oil and the price obtainable for is regulated by the price of cottonseed oil. The Tariff Commission in its report anut oil, page 167 of Tariff Information Surveys on the articles in paragraphs d 45 of the act of 1913 comments on this fact as follows: "On the other hand, rice of peanut oil is influenced very materially by the prices of competing oils. lly the price of the crude oil is found to be just a little above the price of crude, lightly below that of refined cottonseed oil."

have explained in our brief on peanut oil that the slight variation in price een peanut and cottonseed oil, which is commonly one-eighth to one-fourth per pound, is due primarily to the lower refining loss of peanut oil and the fact he more limited supply of peanut oil sometime makes the market a little tighter. there are one or two special trades such as the margarine trade which will pay ht premium for peanut over cottonseed oil. By and large, however, the peanut arket rises and falls with the crude cotton oil market.

present the foregoing information to emphasize the fact that the scope of the stic peanut oil industry must constantly be bounded by the extent to which it oil can be produced at a price which will allow successful competition with reat domestic cottonseed oil industry which produces one and one-half billion ls of cottonseed oil annually. Neither domestic peanuts nor imported peanuts e used for the production of peanut oil if the resultant oil can not be sold at a which is competitive with the price of cottonseed oil.

ras the impracticability of producing peanut oil at a price at which it could d which brought about the condition which the Tariff Commission remarks upon ge 167 of survey of the American peanut oil industry, as follows: "In 1919 many ushers announced that they were out of the market for the year because of pre- g high prices of peanuts largely due to a short crop and the great demand for its for butter, candy, and other confectionery purposes."

DOMESTIC PEANUT INDUSTRY CAN NOT BECOME OIL INDUSTRY IN COMPETITION WI[TH] COTTONSEED OIL.

Cottonseed oil is expressed from the by-product of the farmer who grows cott[on;] this by-product is the cotton seed. No cotton is grown solely for the cotton se[ed.] The grower expects to reap his main profit from the lint or cotton. His seed c[on]stitutes an important secondary source of profit.

In the growing of peanuts the peanuts produced constitute a main crop [and] only by-product is a small amount of peanut hay, the value of the yield of an a[cre] being worth only three or four dollars. Out of the peanuts grown, therefore [the] peanut farmer must reap his profit. If the prices secured for them do not yield [a] profit on the acreage planted there is no important by-product to fall back upon.

In the Alabama Markets Journal and Crop Report, published by the Alabama St[ate] Department of Agriculture in conjunction with the United States Department [of] Agriculture, issue of April, 1921, are cost figures obtained from 46 Alabama grow[ers] of peanuts showing that the cost of production of peanuts in 1920 ranged from [...] cents to $1.17 per bushel, which, calculating the weight per bushel at 30 pounds, wo[uld] mean a production cost of $48 to $77 per ton. The total cost of cultivation of [an] acre of peanuts the Alabama Department of Agriculture figures at $33.11, from wh[ich] is subtracted the value of the peanut hay obtained, worth $3.82, leaving $29.2[9 as] the net cost of growing an acre of peanuts.

The price of Spanish peanuts to-day in the Georgia-Alabama district is $50 to $[...] per ton. The price of cotton seed, a by-product from the cultivation of cotto[n, is] $25 to $28.

From a ton of farmer's stock Spanish peanuts the shelling plant or the cru[shing] mill which buys same to-day can get 1,400 pounds of meats and 600 pounds of sh[ells] and trash, possibly more of one and less of the other, but the variation is not sufficient[ly] large to obscure the point we desire to illustrate. Should this ton of farmer's st[ock] peanuts be shelled and used for crushing purposes, the following products valued [at] the following amounts will result:

TABLE 2.—*Yield and value of products of 1 ton of farmers' stock Spanish peanuts [...] crushed.*

Product.	Pounds.	Value.	Mark[et] value [...] basis [...] pou[nd] [...]
Peanut oil	630	$44.10	[illegible]
Peanut cake	750	10.50	[illegible]
Shells and trash	600	1.35	[illegible]
Invisible loss	20		
Total	2,000	55.95	

The foregoing table shows what would be the value of the total products res[ulting] from the crushing of a ton of farmers' stock Spanish peanuts. We now give the va[lue] of the products resulting from the shelling of this same ton of peanuts and the[ir sale] to the nut trade, i. e., the confectioner, the baker, the peanut roaster, and the pea[nut] butter manufacturer.

TABLE 3.—*Yield and value of products of 1 ton of farmers' stock Spanish peanuts [...] shelled and sold to nut trade.*

Product.	Pounds.	Value.	[illegible]
Nuts	1,400	$73.50	[illegible]
Shells and trash	600	1.35	[illegible]
Total	2,000	74.85	

We see from the comparison of Tables 2 and 3 why it is that last year less than [...] cent of our domestic peanuts were used in the production of peanut oil and [to] date less than 2.2 per cent of the most recent crop has been used in the produc[tion ...]

nut oil. We will now show why it is extremely conjectural that peanuts costing n $48 to $77 per ton to grow can ever be used to produce peanut oil.
ottonseed is of no value as human food. This fact places it far below the plane of nuts in the price level. Any product which is edible is automatically assured of a ket at higher prices than a baser product unfit for alimentary usage. The usages of onseed are for the production of oil, feed, fertilizer, and the production of more on.
ton of cottonseed when crushed by the crude cottonseed mill yields the following lucts at the following values.

ABLE 4.—*Yield and value of products of 1 ton of cottonseed when crushed for oil.*[1]

Products.	Pounds.	Value.	Value on basis of pounds.
nseed oil	302	$20.38	$0.0675
:	906	12.68	.014
s.	570	2.00	.0035
	76	2.28	.03
ible loss	146		
Total	2,000	37.34	

[1] roduction records of 1919 season.

: will be noted from the above table that a ton of cottonseed will yield products to value of $37.34 on to-day's market. This ton of cottonseed on to-day's market cost the crude mill from $25 to $28. From Table 2 we note that the value of the lucts of a ton of farmer's stock Spanish peanuts, costing the crude mill $50 to $58 ton when crushed, on to-day's market would be about $56; while the purchase e of the peanuts is double the price of the cottonseed, the value of the products ot double the value of the cottonseed products as it should be, in order for it to be itable for the crude mills to crush peanuts in place of cottonseed. For the price ch the crude mill would pay for 1 ton of peanuts it could purchase 2 tons of onseed. producing products worth practically $75. The cost of crushing a ton of onseed last season was $6 to $12, according to the size of the mill and the crush. cost of shelling and crushing a ton of peanuts is about the same. Thus we see the investment of the same amount of the crude mill's money in cottonseed yields mill from $6.75 to $12.75 more gross profit, according to the mill's crushing cost, 1 when invested in a ton of crushing peanuts.
. is now obvious why we say that the domestic peanut industry is logically a nut stry. will in all probability remain a nut industry, and never be an oil industry s—naturally adverse conditions do not sometimes result in the destruction or : diminishment of the cotton crop, the source of cottonseed, without simulta-sly adversely affecting the peanut crop.
e can not but believe that the almost self-evident truth which we have set forth in above, namely, that only under exceptional circumstances can peanuts be n in this country for oil-producing purposes in competition with our domestic nseed-oil industry, is as apparent to those who buy the Southern farmers' peanuts is to others. We do not desire to be unkind in our attitude toward those elements he domestic peanut industry who are arguing most loudly in favor of high duties) oriental peanut oil and other imported vegetable oils. But it is significant that gentlemen are not crushers of peanuts, and seem to be only indirectly connected ı the crude oil mills which crush peanuts. Since the farmers in those sections re peanut oil is produced do not know whether the purchaser of the peanuts nds to use them for crushing purposes or for sale to the confectioners, bakers, ters and other nut trade, it would almost appear that certain interests attempt to dy the water about themselves by advising the farmer that they can not pay him er prices for his peanuts because of the "ruinous competition" of oriental peanut and other imported vegetable oils, which prevent them from making and selling ut oil of domestic origin at a profit, which is a specious and unfair statement, as in robability the nuts are not being purchased for crushing purposes, but for sale onsiderably more profitable prices to the confectioners, bakers, roasters, and nut "butter" manufacturers, with possibly only the trash and lowest-grade nuts ing their way to the oil mill. It is logical to assume that if the farmer who sells eanuts to those who ostensibly crush them knew that these peanuts were not to

be crushed, but were to be shelled and graded and sold at 5¼ cents per pound on to-da[illegible] market to the nut trade, or a price netting over $73 per ton on the basis of the un[illegible] nuts, that the farmer would expect to receive more than $50 to $58 per ton, th[illegible] paid him to-day in the section of the country which is supposed to produce pea[illegible]

If the interests who have claimed to speak for the peanut crushers of the cou[illegible] were really representatives of these crushers they would frankly admit that pea[illegible] can not be grown as a main crop in the United States and used as an oil prod[illegible] medium in competition with cottonseed which is a by-product and that th[illegible] effective and constructive move which could be taken towards the upbuildin[illegible] domestic peanut oil industry would be the removal of the barriers against th[illegible] free importation of peanuts for crushing purposes with proper duties levied a[illegible] peanuts which compete with domestic peanuts in their legitimate sphere wh[illegible] supplying the demand of the nut trade.

No "tariff barrier" can ever be instrumental in upbuilding a domestic pean[illegible] industry. The element of interchangeability of peanut oil and cottonseed oil ca[illegible] be disposed of by a "tariff barrier." The laws of agricultural economics by wh[illegible] main crop is forced to sell at a higher price than a by-product can not be over com[illegible] the "tariff barrier" which is requested by the United Peanut Association with h[illegible] quarters at Suffolk, Va., a section far removed from the important peanut oil p[illegible] ing centers of the United States, but which, however, is a very important as[illegible] and shipping point of peanuts destined for sale to the confectioner, baker, and [illegible]

NECESSITY OF EXISTENCE OF DEFINITE PEANUT CRUSHING INDUSTRY TO FARMER[illegible] GROW PEANUTS.

We now desire to point out that if the interests who have appeared before th[illegible] making bodies of the present Congress and argued strongest in favor of prohib[illegible] duties upon oriental peanut oil and upon all classes of imported peanuts whether [illegible] for crushing purposes or not, prevail, they will succeed in effectually killing th[illegible] ness of crushing domestic peanuts and this when they claim that their pleas [illegible] behalf of the domestic peanut crushing industry. Whether this work is being [illegible] with premeditated intent or through ignorance of the basic facts we are unable to s[illegible] We only know what will be the outcome of their misguided policy if adopted.

It is patent that there are certain advantages which would accrue to those wh[illegible] the farmers' peanuts and sell them to the nut trade if they can succeed in killin[illegible] already ill-defined peanut crushing industry in the United States. The farm[illegible] peanuts are consumed, commercially speaking, by two classes of users, first and [illegible] important is the nut trade or the users of peanuts for edible purposes, seco[illegible] crude oil mill which crushes them. It will be noted that we do not state th[illegible] farmers' peanuts are sold to two classes of trade. We say "consumed by" in pl[illegible] "sold to" because the farmer generally does not know what use is going to be ma[illegible] his peanuts unless they are obviously so rancid, or otherwise deteriorated, tha[illegible] can be used only for crushing purposes.

Obviously if a condition is created whereby the crushers of peanuts becom[illegible] couraged and quit the field the only people left to buy the farmers' peanuts w[illegible] those which assemble, shell, and clean them for sale to the nut trade. As long [illegible] fore, as the farmer has two classes of bidders for his peanuts and two outlets h[illegible] sured of a much higher market than if he had only one class of bidders and one [illegible] If he is forced by a wrong tariff policy into the hands of the shelling and c[illegible] plants, a dearth of competition will result which will make it unprofitable for [illegible] grow peanuts, a condition which existed some years back before crushers of o[illegible] began the crushing of peanuts in the United States.

The interests of the farmer who grows peanuts can best be conserved by th[illegible] ing of a policy which will build up a peanut-crushing industry in America. [illegible] ing the existence of a fully defined domestic peanut-crushing industry, pro[illegible] thus made for the disposition of the surplus which an especially heavy crop of do[illegible] peanuts might create over and beyond the needs of the nut trade. By me[illegible] this small surplus to the crude oil mills for crushing purposes the market [illegible] nuts is thereby relieved of pressure and higher prices assured. Without th[illegible] to market his surplus peanuts through this secondary outlet the grower would [illegible] mercy of the shelling and cleaning plants which buy for the nut trade.

We have brought out in our brief on peanut oil the fact that any attemp[illegible] clude the importations of foreign peanut oil from this country by the levying [illegible] duties will only result in the injury of our domestic peanut-oil industry. Such [illegible] can not enhance the price of domestic peanut oil, because the complete inter[illegible] ability of peanut oil and cottonseed oil forces peanut oil down to practically th[illegible] level as domestic cottonseed oil and no matter how little imported peanu[illegible] over the top of a tariff wall the price level of the domestic product can not rise [illegible]

vastly greater volume of domestic cottonseed oil rises along with it, an occurrence ch is best encouraged by heavy export demand and not influenced except ad- ely by the placing of artificial restraints upon the natural movements of the kets.

he actual and very concrete injury which would be inflicted upon the crushers of uts in America by the partial or entire exclusion of foreign peanut oil from the ntry would be the narrowing of the market for peanut oil with the consequent hitive effects upon domestic production which would result therefrom.

ne amount of domestic peanut oil produced under present conditions is small. ing 1920 only 13,086,000 pounds were manufactured and for the first six months of only 6,825,000 pounds which is preserving about the same ratio. This small estic production as we have clearly established in our brief on peanut oil is not result of competition from foreign peanut oil, but is due to the fact that the nut is willing to pay much higher prices for the peanuts than can be realized on when put through a crushing mill. This condition and the inability of crushers nport peanuts for crushing purposes to any important extent owing to the existence ohibitory duties is causing the dwindling volume of domestic production.

return to our statement in regard to the narrowing of the market for peanut oil consequent ill effect—the refiners of vegetable oils who purchase peanut oil manufacture products therefrom, such as cooking and salad oils and cooking fats, t have a large volume of raw material to draw upon. The vegetable oil refining stry and the manufacture of edible products therefrom is conducted upon a basis large volume of business and a small net profit, and before a given vegetable oil mes an attractive field of operations unhindered access to adequate supplies of rude vegetable oil must be assured. This is one factor responsible for the enor- growth of our domestic cottonseed oil industry. The domestic refiners have to run comparatively no risk of creating a demand by extensive advertising and ed merchandising for their products manufactured therefrom, and then finding they could not secure the raw material with which to fill the created demand. e being such an abundance of cottonseed oil obtainable many great factories been built in the course of the years of development of the industry since 1880 the crushing of cotton seed first became a distinct industry, which specialize e manufacture of edible products therefrom. There exists then in the cotton dustry a "wide market" for the crude cottonseed oil with consequent assurance constant demand.

e domestic production of peanut oil is of such insignificant volume and its growth ampered under existing conditions that it would be considered poor business y by the refiners of vegetable oils to devote time and effort to the refining of , and it has only been because of their ability to supplement their needs with gn peanut oil that they have been able to place upon the market various edible ucts composed entirely or mainly of peanut oil. If shut off from their access ese supplementary supplies they are then automatically forced to abandon the ling of peanut oil of domestic origin. This is what we allude to when we speak e "narrowing of the market for peanut oil," a condition under which only a few al users would furnish a limited demand for a small volume of peanut oil.

hile for reasons set forth peanut oil can never be a serious rival of cottonseed oil o apparent are the advantages of the upbuilding of a substantial domestic peanut dustry to the southern farmer who grows peanuts, the crude mills who crush and the refiners of vegetable oils who refine peanut oil and make it into finished e products, enough benefit evenly distributed among these interested factors to American labor will result therefrom to fully justify any constructive work in that direction. Peanuts are a most desirable crop in the boll weevil infested of the South or in a crop rotation scheme where cotton has made too heavy de upon the soil. The crushing of peanuts is simple and being of high oil yield ow labor cost in proportion to the value of the finished products renders the ing of same attractive, provided the crushing peanuts can be bought at sufficiently nces to enable the crude peanut oil to compete with cottonseed oil. The refined possessed of an excellent flavor and taste, there being no objectionable odor or to the crude oil which the usual refining processes will not remove such as are nt in certain other vegetable oils such as soya bean. In the growing of peanuts he crushing of same, and in the refining of peanut oil, American labor can find sive employment at tasks where skill and intelligence will assure enhanced ensation.

closely interwoven, however, are the destinies of the domestic peanut oil industry the importation of foreign peanut oil and crushing peanuts that none of the its above given are procurable unless the imported oil is allowed to enter the ed States and the domestic crushers allowed to import peanuts for crushing oses duty free.

PRESENT PERMANENT DUTY UPON PEANUTS RENDERS EXTENSIVE USE FOR CR[illegible] PURPOSES IMPOSSIBLE.

In the act of 1913 a duty of three-eighths cent per pound was placed upon unsh[illegible] peanuts and three-quarters cent per pound upon shelled peanuts, which equal[illegible] per ton and $15 per ton, respectively. The oil yield of a ton of unshelled nu[illegible] be stated as approximately 600 pounds and of the shelled 860 pounds. The ta[illegible] the oil from the unshelled nuts would be about $1\frac{3}{10}$ cents per pound and from [illegible] shelled nuts about $1\frac{7}{10}$ cents per pound. The normal price of peanut oil range[illegible] $5\frac{1}{2}$ to 7 cents per pound. Taking $6\frac{1}{2}$ cents as a fair price to be used for purpo[illegible] illustration, the tax amounts to 20 per cent ad valorem on the oil made from un[illegible] nuts and over 26 per cent ad valorem on that made from shelled nuts.

We have shown in our brief on peanut oil that it was not until prices unde[illegible] influence of war conditions had more than doubled normal prices that peanut [illegible] even a moderate quantity, could enter the country under the present permanent d[illegible] In 1917, with a prevailing price of 15 cents per pound, 27,405,090 pounds, a rela[illegible] small quantity, when considered in relation to the enormous volumes of vegeta[illegible] oils produced and consumed in this country, entered. Inasmuch as the pre[illegible] permanent duty on peanut oil is slightly over 12 per cent ad valorem when [illegible] on a $6\frac{1}{2}$-cent price, it can be seen that if this duty is so high as to keep the foreign pe[illegible] oil out of the country under normal price conditions, it is self-evident that [illegible] peanuts can not be brought in and used for crushing purposes with an ad va[illegible] duty two times or one and one-half times as large, figured on the basis of the[illegible] yield in the shelled or unshelled state, respectively. True, a small percenta[illegible] the peanuts imported during the last two or three years have been used for cru[illegible] purposes, but when these importations were made war values still prevaile[illegible] deflation had only begun to act.

TYPE OF PEANUTS COMMONLY USED FOR CRUSHING PURPOSES KNOWN AS FIE[illegible]

Peanuts for crushing purposes are imported in either the shelled or unshelle[illegible] They may be those which are rancid and therefore unfit for sale to the edible nut t[illegible] They may be the ordinary field run of peanuts and therefore ungraded. The[illegible] be very small peanuts, smaller than those utilized for edible purposes. Th[illegible] be peanuts containing a very large percentage of broken nuts. It can thu[illegible] that there is a more or less automatic separation between the two classes of pea[illegible] i. e., the crushing and the edible, the better class, sweeter nuts being util[illegible] edible purposes. (See addenda.) The price paid for imported crushing pea[illegible] also generally provides a means of separation, as the crusher, being usually un[illegible] pay as high a price as the buyer for the nut trade, secure a more inferior class of pea[illegible]

Peanuts for edible purposes are usually carefully graded according to size a[illegible] number of peanuts to the ounce, the most common commercial grade being [illegible] which signifies that there are 30 to 32 peanuts to the ounce.

CUSTOMS ADMINISTRATIVE FEATURES.

The administration of a tariff under which peanuts would enter duty free fo[illegible] ing purposes and would be dutiable for edible purposes would present no diff[illegible] In the administration of such a tariff the customs authorities could refuse to cle[illegible] peanuts through the customhouses at American ports of entry without a [illegible] affidavit from the oil-seed crushing mill in whose plant each lot of peanut[illegible] crushed. By refusing to clear such peanuts free of duty at the ports of entr[illegible] being actually sold to an oil-seed crushing mill, the administrative feature[illegible] thus simplified and the possibility of any circumstance whereby such peanut[illegible] be cleared as dutiable, the duty paid and then sold for crushing purpose[illegible] amount of the duty previously paid being claimed for by the exporter, [illegible] eliminated. In other words, by such a provision any peanuts intended for cru[illegible] purposes would have to be so declared at the original port of entry with sup[illegible] affidavit from the oil-seed crushing mill purchasing them.

We respectfully petition the committee to make provision in the tariff mea[illegible] under consideration for the duty-free importation of peanuts for crushing p[illegible] and that the proposed duty on peanut oil in paragraph 50, Schedule 1, be re[illegible] from $2\frac{1}{2}$ cents per pound to 40 cents per 100 pounds, as more particularly set [illegible] our brief on peanut oil.

ADDENDA.

I. F. LAUCKS (INC.),
Seattle, Wash., August 26, 1921.

EAI OF RAW MATERIALS, *Washington, D. C.*

:NTLEMEN: You are undoubtedly familiar with the fact that the variety of Chinese iuts used for crushing purposes is the residue which is left after the large sizes been taken out, and the larger sizes which are referred to are the count peanuts h grade from 28-30 to 38-40 nuts per ounce.

r your additional information we submit the following data regarding Chinese ed peanuts, which was obtained by our Kobe office during an inspection trip to gtau, China.

st of the peanuts used for crushing come from the Provinces Tsinan and Tsintong, h lie northeast from Tsingtau. The nuts are brought into Tsingtau as field run, the shells removed (field run contain nuts of all sizes). Few of the nuts coming the above Provinces are used for edible purposes, these being mostly consumed cal trade and by crushing plants. The peanuts coming from the Provinces of tai, Haishu, and Toshu, located southwest from Tsingtau, are used mostly for rt as hand-picked counted nuts for the edible trade. These nuts are, as a rule, r and of better quality than the nuts coming from the Provinces supplying the ing nuts. The nuts from these Provinces are brought into Tsingtau as field run, the shells removed, the shelling having been done mostly by hand. The field-roduct is hand picked to get the nuts of the various counts for edible purposes, pegs, shrivels, splits, etc., are used for oil-making purposes, and are usually d in with the nuts from the crushing quality Provinces at the time of making oil.

e sample which we are sending you is representative of the usual stock of crush-eanuts as used in the orient for oil-making purposes.

we can be of further assistance, please do not hesitate to call upon us.

Yours, very truly,

H. P. BANKS.

TEMENT OF NEYLE COLQUITT, WASHINGTON, D. C., REPRE-SNTING THE UNITED PEANUT ASSOCIATIONS OF AMERICA.

r. COLQUITT. I am also speaking for P. D. Bain, a farmer, who is rman of the tariff committee of this association; Mr. John P. ier, cleaner, who is president of the association, at Suffolk, Va.; T. H. Birdsong, warehouseman and farmer. The gentlemen who eded me said there were no farmers in our association. I am speaking for M. M. Osborn, secretary of the association; J. C. e, sheller and cleaner, Franklin, Va.; R. A. Pretlow, farmer and nan, all of whom are present in the room.

am speaking on the subject of peanuts, paragraph 757, of the lney bill. Judge D. Lawrence Groner, of Norfolk, has repre-ed this association and appeared before the House committee, since that time President Harding has appointed him to the ral bench, and for that reason he could not be present.

iese gentlemen—Mr. Kelly and Mr. Gordon, who preceded me, cularly Mr. Kelly—attempted to quote, or to misquote, members ur association anonymously as to what duty they would be fied with. They have no authority to speak for us. But I not dwell on what they said, for anonymous misquotations will impress this committee. We stand on our own words before House committee. We appeared before the Ways and Means mittee of the House and at that time we stated what the costs here and abroad. Those statements are open to these gentle- and they have not denied or refuted them. We contend that uts cost about 9½ cents in this country to produce; and how can ompete with the Japanese who produce peanuts for 1½ cents a d and pay a freight rate across the ocean of never more than it, unless we have a duty of 4 cents on peanuts? I do not know

how they figure. As a matter of fact, this duty would bring in very large revenue to the Government, as the rate would be con petitive.

At the present time the importations of peanuts, in pounds (takir the equivalent of peanut oil in pounds of the hulled nut for 1920) we in excess of the local production. Those figures can be had from t Department of Agriculture. In round numbers they reached t enormous total of 832,000,000 pounds in 1920.

We do not ask a prohibitive tariff in order to compete with the foreigners—and I speak particularly of Japan and China, which a not mentioned by these gentlemen. We are not speaking of poorer grade of nuts, but the nuts in competition with our Americ farmer. In order to compete with them at all we have got lower our costs of production in some way, and depend upon t superior quality of our nut, even with a 4-cent tariff.

The House placed a duty of 3 cents per pound on shelled and cents per pound on unshelled peanuts. The cost of cleaning a preparing peanuts for market is equal to the cost of shelling, a therefore the rate on both should be the same.

There should be a duty on peanut butter, peanut confecti salted peanuts, and other products made from peanuts not otherw enumerated. We suggest on that a rate of 5 cents per pound. T average cost of production in the United States is 7½ to 8 cents pound; the average cost of cleaning is seven-tenths of 1 cent average price of selling is six-tenths of 1 cent, making 9½ cents pound.

There are $88,000,000 of farm lands devoted to peanuts, approximately $20,000,000 invested in farm implements and mach ery, aggregating over $100,000,000 invested, in this country, approximately 131,500 people are employed in the industry in United States.

Mr. Bain is here, and I would like to have him take the rest of time, so that he can file a brief and reply to some statements m by other gentlemen.

Senator McCumber. We will be glad to hear Mr. Bain.

STATEMENT OF P. D. BAIN, NORFOLK, VA., REPRESENTING T UNITED PEANUT ASSOCIATIONS OF AMERICA.

Mr. Bain. I am representing the United Peanut Associatio America as chairman of its tariff committee, and I have a brief which I would like to file, Mr. Chairman, and I would be very g to answer any questions. There are many things that might said, but I can not make a speech. I am not used to that.

Senator McCumber. We have had so many speeches on this subj and the briefs you have filed are so complete that I think if committee has any capacity at all they ought to be able to und stand it.

Senator La Follette. You heard the statements of the gentl who preceded you?

Mr. Bain. Yes, sir; I heard Mr. Kelly, and my brief will not with his.

Senator La Follette. Will it cover the proposition which presented?

Mr. Bain. Yes, sir; I think so.

ßenator LA FOLLETTE. He stated your side of the case fully?

ßr. BAIN. I think so, sir; but there are some points of Mr. Kelly's ument to the effect that he could not get extra large peanuts.

ßenator LA FOLLETTE (interposing). I think if you would like to end your brief to meet any statements that have been made, it uld be agreeable to the committee to do that.

ßr. BAIN. I would like to answer some things already brought up. instance, about the oil business. Oil has been very low for the several months—4¼ to 4½ cents per pound. After shelled it ıld take practically 3 pounds of peanuts to make 1 pound of oil. you can see what price the farmer would get for his peanuts put oil. They absolutely could not do it; they could not produce at those prices.

ls Georgia and Alabama got from $25 to $28 a ton for a good ay of their peanuts this year, because oil was so low, and the rgia runners are a class of nuts that are not what we call an "edible "; they are not first-class edible nuts. Some of them are used, we do not consider them a first-class edible nut, such as the nish or the Virginia. Consequently, we want protection on peanut for the farmers who raise this class of peanuts. If you do not the protection, they can not raise them.

he whole South can raise peanuts, and some of the lands can not e anything else.

am just from the South directly here, and it is appalling the con- on that the southern country is in on account of cotton and the price of peanuts. The boll weevil have taken charge of a whole of that country. I have one of the boll weevils in a matchbox ch I caught day before yesterday. It is pitiful to see cotton l after cotton field that they will not get any cotton from, and sequently they will not get any seed with which to make oil; and need peanuts to make oil in place of the cottonseed oil. In other ds, cottonseed oil generally brings one-fourth to a cent a pound than peanut oil. That is my experience from actual sales. I interested in some peanut-oil business.

ast year we brought into this country approximately as many nuts as we raised here. That is, you put the peanuts back into -it takes, as I say, just now 3 pounds of shelled peanuts to make und of oil. So you can multiply this quantity of shelled peanuts hree. And then the large quantity of peanuts that actually came this country was 132,000,000 pounds—that is, peanuts alone, rding to the Government statements; the peanut oil was 000,000 pounds.

you can see that large quantity of peanuts and peanut oil that come to this country.

nator LA FOLLETTE. The peanut oil represented between three four times as much in peanuts?

r. BAIN. About three times as much in peanuts as in peanut and if that oil had not been brought here the farmer would have something for his stuff; it was an impossibility for us to compete the Chinaman.

is a fact that the Chinaman does not get over 5 to 8 cents a day his labor. And another fact, there have been peanuts brought Japan to the Pacific coast at $280 a ton, and those peanuts can

be brought to New York from the Pacific coast, all rail, at $2, and the same railroad would charge us $2.75 cents a hundred pounds to ship back to the Pacific coast. Those are facts that you can get from the Railroad Administration. Why we are discriminated against in that way I do not know. We have been fighting, but we have not got any relief.

Just to show you how the orientals are favored in most every thing of that kind, the railroad says: "We want freight to haul that way." That is about all the excuse we can get out of them.

Another thing—I do not know why this is the case—but China produces about twice as many and possibly three times as much to the acre as we produce. That speaks badly for our country, but they are intensive farmers. A farmer over there, as I understand, has an acre or 2 acres, and he produces everything to the limit you imagine.

Senator LA FOLLETTE. What is the average yield per acre in the South?

Mr. BAIN. We think the average, on the whole, is about 35 bushels to the acre. They have the advantage of freights; they have the advantage as to labor.

Senator LA FOLLETTE. What is the fair market price a bushel? You say you raise 25 bushels to the acre.

Mr. BAIN. We do raise about 25 bushels to the acre.

Senator LA FOLLETTE. What is your average price per bushel marketing them? I am trying to see what yield in value you get out of your land.

Mr. BAIN. That varies so much it is hard to tell, but I will tell you what it has been for the last two months. You take Georgia runners, and we have bought them at $27 a ton, delivered at our plant in Albany, Ga.

Senator SUTHERLAND. How many bushels are there to the ton?

Mr. BAIN. The Georgia runners average about 25 pounds to the bushel; the Spanish are carried at 30 pounds to the bushel; Virginias are carried at 22 pounds to the bushel. They vary in size. Consequently, they vary in number of pounds to the bushel.

You take a ton of Georgia runners—to make it a little more explicit than that: The Georgia runners will average 40 bushels to the acre and the Spanish will not average over 30 bushels to the acre.

Senator McCUMBER. There are other witnesses, so you must be as brief as you can.

Mr. BAIN. I will do that as much as possible. That is what I am trying to do. I am representing the farmer as well as myself. I am a farmer; I raise some nuts.

So you can see $28 a bushel is extremely low.

Senator SUTHERLAND. You mean $28 a ton?

Mr. BAIN. Yes. You can see how much it would bring a farmer an acre. He does not get the cost of thrashing. They cost about 60 cents to thrash and get them off of the vines. So that is about all of it.

It is appalling when a man goes to the South and observes conditions there. They are much worse off than the Virginia people. The Virginia people have a better class of nuts. The Georgia nuts supply the vendors entirely, and they have been getting the better prices

it they have been losing lots of money and our farmers there are in very bad condition.

Mr. Kelly said he could not get the large nuts except from China. beg to differ with him. If we can get a price here we can furnish om Virginia, North Carolina, and Tennessee the large nuts that he quires. They may not be 28s, but they will be 30 to the ounce, d we know there are large quantities of those peanuts going to be ported anyway, as there is a demand for those large-size nuts, and ey are going to come even if the tariff was 8 cents a pound.

Senator SUTHERLAND. Do you raise any nuts yourself?

Mr. BAIN. I have raised some nuts.

Senator SUTHERLAND. Are you now engaged in the production of ts?

Mr. BAIN. I do not raise them with my own hands, but I have ms on which they are raised; yes, sir.

Senator SUTHERLAND. But your business is principally shelling d cleaning, is it not?

Mr. BAIN. Yes, sir. Shelling and cleaning.

EF OF P. D. BAIN, NORFOLK, VA., REPRESENTING THE UNITED PEANUT ASSOCIATIONS OF AMERICA.

his brief is filed on behalf of the United Peanut Associations of America, an anization composed of peanut growers, millmen (peanut cleaners, shellers, and ilers), and other interests identified with the manufacture of peanut products. membership embraces the largest interests identified with the cultivation and oufacture of peanuts and peanut products in the United States.

. protective tariff for the peanut industry is a matter in which the farmer and the lmen are equally concerned, because the existence of the industry on all of its nches depends upon such tariff.

'eanuts are raised in nearly every part of the world. In Africa the yield is very e, but the quality inferior as compared to the American peanut. In France and in large quantities of peanuts are imported from India and South Africa, and when ported to the United States are a decided influence in fixing the price of the erican product. Since the World War, however, the importations from France Spain or either of them has been negligible.

n China and Japan a considerable part of the native population is engaged in ing peanuts, and the area of land under cultivation there is increasing rather than reasing, and the production per acre nearly double that in the United States. importation of Chinese-Japanese nuts into the United States has been on a con-ally increasing basis, and the quantity which may be imported is almost unlimited. s not therefore a question of supplying the surplus demand in this country—it is ly a question of the complete absorption of the American market. Within the last 'ears the importation of peanuts and peanut oils from Japan has grown from a few lion pounds steadily and uninterruptedly (except for a brief period during the ld War) until it reached in 1920 the enormous total of over 132,000,000 pounds of led and unshelled peanuts and approximately 165,000,000 pounds of peanut oil iivalent to approximately 700,000,000 pounds of peanuts), or a total of peanuts sported to its equivalent of farmers' grade peanuts in the shell of over 872,000,000 nds of peanuts—equal to nearly 90 per cent of the American crop.

his association does not ask for a prohibitive tariff, but it does ask for a protective f equal at least to the difference in the cost of production here and in the Orient, the cost of transportation and plus a small profit to the local producer.

he growth of the industry of recent years, the additional usage of peanuts and nut products, impels the conclusion that the industry is yet in its infancy and thousands of acres of land in the United States now abandoned or unprofitably l may be converted into peanut-raising farms, adding largely to the individual lth of the community and furnishing employment to additional thousands of lers. The demand for the peanut in confections and other industries will furnish ll times a market for the foreign-grown peanut, which, on the basis of the tariff osed and requested by this association, will, it is believed, increase considerably present revenue of the Government from this source.

Under the act of 1913 (par. 225) the tariff on peanuts was fixed at three-[illegible] 1 cent per pound on unshelled, and three-fourths of 1 cent per pound on [illegible] peanuts.

Ninety per cent of the importations into this country are of the shelled [illegible] This, of course, makes the imported nuts a direct competitor of the American [illegible] nuts, both as affecting the farmer and the millmen.

H. R. 7456, paragraph 757, as passed by the House of Representatives [illegible] for a tariff of 3 cents per pound on unshelled peanuts and 4 cents per pound on [illegible] peanuts.

We wish to suggest to this committee, or rather ask them to consider, that the [illegible] cleaning and preparing peanuts for market is equal to the cost of shelling; [illegible] that the rate on both should be the same. In China they wash and polish the [illegible] which are imported here as peanuts in the shell, and same is ready to go on the [illegible] a finished product.

We respectfully recommend to this committee that the duties be changed as [illegible] lows—that is to say, that a duty of 4 cents per pound be established for both [illegible] and unshelled peanuts, and that a duty on peanut butter, peanut confections, [illegible] peanuts, and other products made from peanuts not otherwise enumerated, be [illegible] with a duty of 5 cents per pound. A duty is requested on peanut oil as [illegible] the association's separate brief and filed with this committee August 18, 1921. [illegible] especially ask that the rate of 5 cents per pound for peanut butter, peanut [illegible] and salted peanuts be added to the proposed bill H. R. 7456, in order to protect [illegible] domestic manufacturer of these products against the imported manufactured [illegible]

COST OF PRODUCTION IN CHINA AND JAPAN.

No positive statistics are available for computing the actual cost of production [illegible] China and Japan. Application has been made to the Bureau of Information [illegible] subject, and direct to American representatives in these countries. But the [illegible] of fixing such costs has been shown to be due to the fact that the average [illegible] peanut farmer cultivates a very small area of land, frequently less than an acre. [illegible] requires and obtains no hired labor to do the work of planting and harvesting his [illegible] The work is done in nearly every instance of the small farmer by the children of [illegible] family, beginning as young as 5 years of age.

The average cost of production of peanuts in the United States under present [illegible] tions is at least 8 cents per pound. This average, of course, varies in the several [illegible] in which peanuts are grown. But by the most careful review of figures, in no [illegible] growing section of this country is it possible to figure an average in any State of [illegible] than 7½ cents per pound.

The average cost of cleaning and processing peanuts in order to prepare them [illegible] sale is approximately seven-tenths of 1 cent per pound, and the average cost of [illegible] ing is about six-tenths of 1 cent per pound (plus). From which it will be seen [illegible] the cost of the American-grown peanut in the condition in which the Japanese [illegible] arrives in this country for sale in our markets, is from 9 to 9½ cents per pound. [illegible] therefore, the cost of production in Japan is 1½ cents per pound, and if the [illegible] fixed at 4 cents per pound, and the cost of transportation at 1 cent per pound [illegible] is almost twice as much as the average shipping rate from Japan to the [illegible] seaports on the Pacific) it will be seen at a glance that the American farmer [illegible] sell, even at this increased duty—on a basis of equality of product—at a loss. [illegible] is, however, some small difference in the quality of the American and the [illegible] peanut, which gives certain grades of the American-grown nut a slight [illegible] in the market over the foreign grown. The difference in quality, plus such [illegible] in the cost of production as may come in the reestablishment of normal [illegible] it is believed by the members of this association, will probably take care [illegible] difference in the cost of producing it in Japan and China, plus the proposed [illegible] freight, etc. But less than the amount of duty asked would utterly fail to [illegible] the protection and preserve the American market for this product for the [illegible] farmer.

We are prepared with affidavits and other evidence, cost sheets, and such [illegible] tion as is pertinent, to prove to the satisfaction of this committee the [illegible] of the figures contained in the preceeding paragraphs, and if it be conceded [illegible] these figures are correct, no argument, it is submitted, is required to arrive at [illegible] conclusion which we insist upon, namely, that without the increased duty [illegible] this industry in which approximately 750,000 Americans are, directly and [illegible] engaged for a living, shall cease altogether to exist.

The United States Tariff Commission makes a statement that most of the [illegible] for crushing purposes are imported peanuts. We will admit our inability to [illegible] this commission arrived at that conclusion and feel secure in making it as a [illegible]

fact. We feel that we are in position to dispute same, and state that a very, very nall per cent of the importations of peanuts are used for crushing purposes. During e past season, some three or four shiploads came over to the United States, sold to l crushers, other consignments were sold to oil mills, because when they arrived e peanuts were damaged to such an extent that they were not suitable nor fit for y other purpose. We also call this committee's attention to the fact that there e in the extreme South some fifty and odd crushing mills, and they buy nearly all their crushing stock from American farmers. The fact is, that there is a competition tween the shelling trade and the crushing trade or oil interests, which govern hether or not the peanuts grown in the far South, go into oil or otherwise, and this ovides a market for the millions of bushels of the little Spanish peanut. Were ese, the entire crop, compelled to go on the market as shelled stock it would over-pply the domestic market and demoralize same, so that the oil market for domestic anuts is necessary to net the American farmer a living price on his peanuts.

Again referring to the cost of American production, we beg to call your attention the fact that the figures submitted above are all based upon the cost of the peanut the farmer on the farm and do not embrace in any instance transportation into the arkets of the country.

The cost of production of the Japanese-Chinese nut is figured as of the time of its rival at Seattle or San Francisco, the large ports of entry on the west coast. It is t, however, an uninteresting fact that the cost of transportation from the Pacific ast points to eastern points on peanuts, overland, is $2 per 100 pounds, whereas e cost of transportation from the East coast points to Pacific coast points, or the verse of the original proposition, is $2.75 per 100 pounds. This is a clear discrimina-n against the domestic peanut industry, and should be taken into consideration. e immense territory from the Mississippi River to the Pacific Ocean has, in a large easure, for years, more and more, been preempted by peanuts imported from the ient. This denial to the American farmer of his own market to the extent of 75 per nt of American territory is un-American and unjust. It inures only to the benefit the Chinese farmer, exporter, and the few American importers engaged in business the Pacific coast. No benefit or advantage accrues to the consumer.

There need be no fear that American farmers can not supply the demand for peanuts. y reference to Appendix A it will be noticed that there are approximately 9,340,000 res in the South that are adaptable to the culture of peanuts. The Government ports state that there are 1,240,000 acres devoted to peanuts in 1921. This was out the same as reported for 1920. Much of this land is unsuitable for any other op, much of it is infested with boll weevil, which has made the raising of cotton an ter impossibility. Hence we claim that our Government can reclaim idle lands for e culture of peanuts if a suitable and a reasonable market is provided for the merican farmer.

Attached hereto is an appendix containing certain general information which is bmitted for the information of this committee, and this brief is filed for the purpose affording the committee a general outline of the questions embraced in the imposi-n of a tariff duty on peanuts. It is expected to supplement the same at the oral aring by the evidence of men whose lives have been devoted to the cultivation d to the manufacture of peanut products, and it is requested that permission be nted to file with the committee from time to time such affidavits bearing upon the tistical questions involved as may be in point and helpful.

THE USES OF THE PEANUT.

Practically no portion of the peanut or peanut plant need go to waste. From the anut kernel is manufactured many different confections, peanut butter, salted nuts, etc. The peanut is now recognized as one of the most nutritious food products ed in the United States. The largest and best of nuts are sold for roasting and are d largely by street vendors.

Then from the varieties grown in all States of the South, with the exception of ginia, North Carolina, and Tennessee, is extracted one of the very best edible that is on our markets to-day. By crushing the peanuts in the hull (afterward ghtly cooked) is obtained a crude oil that must be refined before being placed on retail market. By shelling the nuts, removing the red skins and hearts, a virgin anut oil is obtained that comes into uses for which olive oil has long been the sole essor. Up until the time of the passage of the pure food laws requiring correct eling, it is said that much of the virgin peanut oil was sold as olive oil. The vines ve a high feeding value, but are in most Southern States left on the ground as a ans of fertilization.

Appendix A.

The importance of the preservation of the peanut industry to the United S... might be stated in value of money invested and the number of people affected. ... it has done for the farmer, and what the possibilities are for the future.

Capital invested.

Number of acres estimated in the South that is adaptable to the culture of peanuts and can thus be utilized if a market is available for the product	9,340,...

In the South, it is estimated that there are approximately 9,340,000 acres of l... that will produce peanuts. Some of this land is suitable for other crops, but th... are many sections of land that are not being used that can be devoted to produ... of peanuts.

The Spanish peanut is not so choice about the land, more than it should be ... soil, and will grow and make good production where other crops will fail. It ... cash crop for sections infested with the boll weevil, making the raising of cotton alm... an impossibility. We have a report from the southern part of Georgia this year st... ing that in certain sections the boll weevil has so taken the cotton crop that it is ... worth picking. One farmer who has 200 acres planted to cotton says that if he c... get pickers to harvest the crop that he would not have over three bales of cot... This proves that in these sections another crop is necessary in order to save thous... of farmers.

No American would be satisfied to live as do the Asiatics, and unless we want ... standards brought down to their level we must place barriers up so that their pro... can not drive our people out of business.

The committee's attention is invited to the sudden growth of imports for th... 1919 and 1920, as shown in Appendix B. From a gentleman who addressed the U... Peanut Associations of America convention held at Norfolk, Va., July 13, 19... learn the reason for this growth. That is that unlimited acreage can be br... under cultivation in China, especially in sections where peanuts and soya bea... produced. This land can be purchased for what is in United States currency ... $12.50 per acre. All that is needed is for the Chinaman to know there is a m... for his peanuts and peanut oil, soya beans, and soya-bean oil. If given the o... tunity, China could in time produce all the vegetable oil needed by the entire ...

The whole question in a nutshell, from our point of view, is that the en... volume of oriental importations of peanut oil should pay a tariff tax of at least ... per pound, first, to protect the peanut industry of the United States and, se... to produce revenue for our Government.

It is true that the importations of peanuts and peanut oil for the portion of th... 1921 are much smaller than in 1920, but let us not fool ourselves in believing that ... is no danger from this source. China can in a very short time resume exportin... volume she did in 1920 if given the American market.

Appendix B.

SOURCES OF IMPORTS.

Several years ago the imports of peanuts and peanut oil came principally f... France and Spain. But of recent years the tide has turned and is now domin...

lmost entirely by China and Japan. Japanese buyers predominate in Northern hina, and export from Japan. Many shipments are accredited as originating in apan, when they are, for most part, Chinese produced goods. This makes practically o difference, as the wage scale is about the same in the two countries.

The following figures were supplied this association by the Bureau of Foreign and omestic Commerce, Department of Agriculture:

Year ending June 30—	Peanuts unshelled.	Peanuts shelled.	Year ending June 30—	Peanuts unshelled.	Peanuts shelled.
12	12,950,563	2,627,475	1917	7,806,012	27,180,748
13	12,281,580	6,801,415	1918	3,150,747	73,362,215
14	17,472,631	27,077,158	1919 (embargoed)	1,444,221	19,462,080
15	14,540,982	9,643,691	1920	12,067,998	120,344,425
16	9,020,848	19,392,832			

This table takes no account of the importations of peanut oil, which in the year 1920 xceeded 165,000,000 pounds.

EXPORTS.

	Pounds.		Pounds.
912	5,920,711	1917	22,413,297
913	7,301,381	1918	12,488,209
914	8,054,817	1919	12,596,660
915	5,875,076	1920	14,137,956
916	8,413,297		

This proves conclusively that the exports of peanuts is a very small per cent of he combined total of domestic (see Appendix C) and imports. Taking for example he year 1920: Domestic production 37,499,000 bushels, or 937,475,000 pounds; imports, shelled and unshelled, 132,412,423 pounds.

One billion sixty-nine million eight hundred and eighty-seven thousand four hundred and twenty-three pounds on the American market and exports of 14,137,956 pounds shows a very small per cent of the crop exported.

The above comparison stated in pounds (domestic production) when linked with he imports, makes it appear that the imports are only 10 per cent of the domestic production.

In order to get a correct view of the proposition it is necessary to consider the following facts: Eleven million bushels of the domestic crop estimate (37,000,000 bushels) comprise the Jumbo, or large variety, grown only in Virginia, North Carolina, and Tennessee. The remainder of the 37,000,000 bushels are mostly Spanish variety, usually grown for their oil content more than to be shelled and sold to the manufacturers of confections, peanut butter, salted peanuts, etc.

The variety imported is the same as that produced in Virginia, North Carolina, and Tennessee. Of this there was imported 132,412,423 pounds shelled peanuts. It is estimated that more than one-third of the weight is lost in shelling, i. e., this much is taken up with hulls, trash, etc. So, in order to make up the amount imported of shelled peanuts it required 200,000,000 pounds of farmers' stock peanuts (and this is a very conservative estimate). Then add to this the amount imported in the shell and we have a total of 212,000,000 pounds imported peanuts, reduced to equivalent of American-grown farmers' stock peanuts. Twenty-two pounds of this variety is recognized as a bushel, this makes the imports almost equal to the Government estimate of the domestic production of the same variety grown in Virginia, North Carolina, and Tennessee. In fact it can be said that they are equal, because of the fact that a loss of at least 10 per cent is met with in cleaning peanuts to be sold in the shell.

Now we will compare the remainder of the Government's estimate of domestic production with the imports of peanut oil, because peanuts were required abroad to manufacture this oil, and same after being in this country came into competition with domestic oil.

It is generally estimated that on an average a bushel of Spanish peanuts (30 pounds to the bushel) will produce 1 gallon of oil. The imports of peanut oil for 1920 were 22,064,363 gallons; so granting that it requires a bushel of peanuts to produce one gallon of oil, we have here represented 22,064,363 bushels of foreign peanuts—peanut oil reduced to its equivalent in peanuts. Subtracting the 11,000,000 estimate for Virginia-Carolina section from the total United States production, we have an estimate of the entire domestic production of peanuts outside of these two States of near

26,000,000 bushels. This makes the ratio of imported and domestic peanuts on o[illegible] markets about 55–45, almost as much imported as is produced in the United Sta[illegible] making an equation 55 domestic grown and 45 imported.

Appendix C.

DOMESTIC PRODUCTION.

The rapid growth of the peanut industry during recent years is one of the [illegible] striking developments that have taken place in the agriculture of the United States.

Peanuts were introduced commercially into the United States about 18[illegible] [illegible] from that time until about 1900 the production increased gradually. In 1[illegible] [illegible] production amounted to 3,588,143 bushels. In 1909 this increased to 11,[illegible] bushels from an acreage of 869,887.

The following is the report from the Yearbook of Department of Agriculture:

	Bu[illegible]
1916 (1,043,350 acres)	34,4[illegible]
1917 (1,842,400 acres)	52,[illegible]
1918 (1,865,400 acres)	46,0[illegible]
1919 (1,251,400 acres)	33,[illegible]
1920 (1,268,000 acres)	37,4[illegible]

Appendix D.

PEANUTS A SUITABLE CROP FOR BOLL-WEEVIL INFESTED SECTIONS.

Several years ago the boll weevil began its destructive work on cotton in the S[illegible] It appeared for a few years that the sandy land districts were ruined, as the san[illegible] soil farmers could not successfully grow the substitute crops, such as wheat, oats [illegible] corn. On account of the condition sandy-land farmers, merchants, and bank[illegible] faced bankruptcy and were saved only by the increased acreage in peanuts, s[illegible] sections planting as much as 60 per cent of the entire cultivated acreage. Af[illegible] producing one or two crops the sandy-land farmers realized that the advent of t[illegible] boll weevil was a blessing in disguise. "Peanuts and hogs" soon became the sand[illegible] land farmers' motto.

Now, if to-day we permit the Chinese farmers to usurp American markets w[illegible] their cheaply produced peanuts and soya beans, we at the same time remove [illegible] from the southern farmer, who has found it a life-saving factor. We can not beli[illegible] that this committee will so rule.

BRIEF OF GEORGE R. SIEVER, REPRESENTING THE FOREIG[illegible] COMMERCE ASSOCIATION OF THE PACIFIC COAST.

This brief is presented on behalf of the import peanut industry of the Pacific [illegible] comprising those engaged in transporting, handling, weighing, analyzing, inspect[illegible] storing, manufacturing, and marketing imported peanuts and peanut products.

We respectfully recommend that paragraph 757 of the Fordney tariff bill [illegible] proposes a duty of 3 cents a pound on peanuts not shelled and a duty of 4 cen[illegible] pound on shelled peanuts, be made to read as follows:

"757. Peanuts not shelled three-eighths cent per pound; shelled peanuts th[illegible] fourths cent per pound."

We make this recommendation because of the following facts, which will be [illegible] established herein:

1. The production of peanuts in the United States is not now, and never [illegible] been, sufficient to meet the requirements of our consuming market.
2. The rapidly growing demand for peanuts, increased by the use of this comm[illegible] in new industries, will bring about a steady expansion of the domestic mark[illegible] will provide a field for both domestic and imported nuts for years to come.
3. Foreign peanut producers have no advantage over American growers in [illegible] peting for the home market, as laid-down costs in the principal consuming c[illegible] are practically the same.
4. The losses of domestic producers can not be ascribed to the competit[illegible] imported peanuts, as all agricultural commodities suffered similarly during the [illegible] slump in prices.
5. Already favored by a superior product, bringing higher prices, domestic gr[illegible] will obtain additional protection against any possible future advantage of [illegible] producers by a return to normal conditions, the standardization of processes, and [illegible] improvement of marketing methods.

6. The proposed duty is so prohibitive as to amount to a virtual embargo.
7. By giving manufactured peanut products a lower duty than raw peanuts, the oposed rate will seriously discriminate against American industries.
8. Restrictive duties on peanuts will injure our trade relations with promising eign buyers of American manufactured products.
9. Our merchant marine and the domestic side of importing represent hundreds of llions of dollars in invested capital and thousands of American citizens—an indus- that deserves the same consideration given to other lines of domestic business.
10. The principal nations of Europe have placed reasonable rates of duty on peanuts d peanut products, an example that should influence similar action by the United ates.

The tariff history and the general features of the peanut industry, domestic and eign, have been given such exhaustive attention by the southern producers that will not be necessary to give these phases of the subject more than occasional erence herein.

For a consideration of the oil side of the peanut industry we respectfully recall to minds of members of the committee the comprehensive statement covering all getable oils, submitted at an earlier hearing by the bureau of raw materials for erican vegetable oils and fats industries.

First point: "The production of peanuts in the United States is not now, and er has been, sufficient to meet the requirements of our consuming market."

Introduced into the United States in 1870, the peanut industry has grown by leaps l bounds, but never speedily enough to equal the demands of the public for this ular, nutritious, and moderate priced food. Within the last five years the indus- has assumed most important proportions, as the statistics of the Departments of riculture and Commerce show.

From these figures (presented at hearings of the Ways and Means Committee by estic growers) we find that in 1916, with a domestic production of more than 0,000,000 pounds (30 pounds to the bushel) the American market absorbed almost 00,000 pounds of imported peanuts in addition In 1917 with a domestic crop 1,500,000,000 pounds, 50,000,000 pounds of imported peanuts were required to sfy the market In 1918, the South produced 1,400,000,000 pounds, and 103,000,000 unds were imported to meet domestic demands. In 1919, with a domestic pro- tion of approximately 1,000,000,000 pounds, the American market absorbed ost 35,000,000 pounds in addition. Last year we produced about 1,200,000,000 nds and imported 175,000,000 pounds; a total of one and a third billions of pounds eanuts, practically all consumed in the United States.

The above figures show that we have not yet reached a stage where we can depend n our own growers to produce the enormous quantity of peanuts that our con- ing market requires. It is evident, therefore, that any duty whatever placed n imported peanuts will react upon the consumer as an addition to the price would otherwise pay. Recognizing the demands of the Government for addi- al revenue, however, we recommend the readoption of the rates provided in the ff act of 1913, that proved such a profitable source of income without victimizing consumer.

In computing the above for comparison with domestic nuts not shelled, we have ed one-third to the volume of shelled nuts imported, as this is about the weight in shelling.

Second point: "The rapidly growing demand for peanuts, increased by the use his commodity in new industries, will bring about a steady expansion of the estic market that will provide a field for both domestic and imported nuts for s to come."

According to those closest in touch with the peanut industry, the demand for nuts will undoubtedly grow rapidly for a number of years, even allowing for a dy increase in the acreage under cultivation, in this way continuing the inade- y of production as compared with consumption.

We direct your attention to the facts brought out by Mr. George Carver, an expert ess who represented the domestic growers before the Ways and Means Committee. In a most interesting brief (House hearings, p. 2070) Mr. Carver stated that the ibilities of the peanut industry were unlimited. Referring to the staggering es of production, importation, and consumption presented, Mr. Carver told the mittee that the field for the peanut's use had barely been touched.

The witness cited 150 commercially possible adaptations of the peanut, requiring he nut's component parts—meat, oil, skin, and hull. Some of the many and ed products Mr. Carver mentioned that have already been successfully made the peanut are confections, breakfast foods, flour, milk, coffee substitutes, stock- , quinine, face cream, dyes and stains, polishing substances, etc.

The enormous business built up in peanut oil during the war indicates the possibilities of the nut from the oil side alone.

The fact that the domestic market last year consumed all the peanuts grown here and importations in addition declared by the producers to be "infinitely greater than in any previous year, although only a few of the nut's many uses were exploited, shows the enormous capacity of the home market and indicates what may be expected in the way of future expansion.

The Southern growers themselves realize that they can not hope to supply the entire demand for years to come, as is evidenced by the statement in their brief (House hearings, p. 2054) "The demand for the peanut in confections and in other industries will furnish at all times a market for the foreign-grown peanut."

Third point: "Foreign producers have no advantage over American growers in competing for the home market because laid-down costs in the principal consuming centers are practically the same."

In pressing their claims for a high protective tariff domestic producers have stressed the contention that the home industry is menaced by low-priced foreign competition. In an effort to bolster up these claims the southern peanut shellers have charged that peanuts can be bought in the Orient for 1 or 2 cents a pound, transported to this country as ballast, practically without cost, and disposed of at a price less than the cost of hauling domestic nuts to home markets.

The evidence on which this remarkable statement is based is admittedly composed almost entirely of hearsay and guesswork. In the brief of the United Peanut Associations presented to the Ways and Means Committee (House hearings, p. 2... exhaustive estimates of oriental production costs, carefully prepared by the growers to substantiate their claims, were prefaced by the remark that "no positive statistics are available for computing the actual cost of production in China and Japan." The reliability of evidence established on such a basis may properly be questioned.

For a short comparison of costs of peanuts, domestic and imported, laid down in the principal markets of this country, we find that domestic nuts last year cost from ... to 8½ cents a pound (House hearings, p. 2051). On the other hand, statistics presented by the growers themselves (House hearings, p. 2068) show that the "export c. i. f. Pacific coast ports price of the 30–32-ounce grade in June, 1920, was $7.... 100 pounds. The export price for the small-sized quality was slightly less; but as the total yield is very small the export of these qualities amounts to little."

To be perfectly fair we will figure domestic nuts as worth 8 cents in the South and oriental peanuts as worth 7¼ cents c. i. f. Pacific coast ports. Using the duty of three-fourths cent per pound provided in the tariff act of 1913—the duty recommended for readoption—makes the imported peanut landed at Seattle or San Francisco, duty paid, cost equally as much as the domestic nut in the South. The cost of transportation to Middle-Western markets is a little higher from Pacific coast terminals than from Norfolk; and appreciably higher from Pacific coast terminals to New York than from Norfolk to that point. From this comparison based on growers' testimony and the reasonable rate provided in the tariff act of 1913, it is evident that laid-down costs in the primary American markets in 1920 were actually less than those of foreign nuts coming into direct competition.

Another factor that must be considered is the distinct preference of the American buyer for domestic nuts. From growers' statements (House hearings, pp. 2... Japanese and Chinese peanuts "are not as good or as merchantable or as susceptible to conversion in sales in the raw state or the roasted state as the American peanut." And (House hearings, p. 2055) "there is some small difference in the quality of the American and Japanese peanut, which gives certain grades of the American product a slight advantage in the market over the foreign-grown." It is thus seen that the two varieties are not only on a fair competitive basis as regards laid-down costs but the domestic nut has a noticeable advantage on account of the preference of American buyers for the home-grown product.

In demanding tariff relief to protect domestic growers from alleged unfair freight rates to markets west of the Mississippi, the southern producers are attempting to set Congress against the Interstate Commerce Commission. Even admitting the justice of their claim to the rate basis they desire, we submit that the proper place for this matter to be taken up is before the Interstate Commerce Commission which has been delegated by Congress to supervise transportation rates.

If it is claimed that comparisons of relative costs during normal times would not justify the conclusion reached from the above computations, we direct your attention to a further consideration of this point. According to the testimony of the United Peanut Associations (House hearings, p. 2051), peanuts were produced in the South under normal conditions at a cost as low as 3½ cents a pound. Factors influencing this price and favoring the domestic nuts are extensive and large-scale production, machine cultivation and harvesting, and the proximity of consuming markets to producing sections.

On the other hand, foreign peanuts are grown and marketed under the most un- orable and primitive conditions, thousands of miles from United States markets. duced on small farms according to antiquated farming methods, they are hand- nted, hand-cultivated, hand-harvested, and hand-shelled by labor known for its productivity.

ut production costs are probably the least important of the many items of expense etting the nuts to American markets. The committee is no doubt familiar with charge now being made by western cattlemen that the railroads get as much for ying steers to the Chicago market as the ranchers get for raising the stock. Such litions have long prevailed in the Orient, and together with the expensive system rading through numerous middlemen, marketing costs equal production costs ral times over.

luctuations of exchange constitute another difficulty that must be overcome. le passing through the hands of the various middlemen, native currency must be ed into taels, and then to gold; or from silver yen to gold yen and then to gold rs. Risk of loss from this source requires that a considerable allowance be made very transaction to cover possible fluctuations, an item that adds to the final of the nuts appreciably.

t harvest time the peanuts are brought to the local market to be turned over to native buyer who has probably contracted for the crop months in advance. They then hauled to the larger native market or to the export center—in the case of ese peanuts destined to the great Kobe market, they are handled across the dock loaded aboard ocean carrier at port of departure, unloaded, and likewise handled obe, then hauled to a warehouse for storage. In the wholesale center they are to the next middleman, rehauled, and reloaded aboard vessel, this time for trans- ition to Europe or the United States.

e transpacific haul, far from being practically nominal, is a considerable item, in al times amounting to about 40 cents per 100 pounds. During June, 1920, when ¼ cents per pound c. i. f. Pacific coast ports figure obtained, the rate was about er ton on unshelled and $15 per ton on shelled peanuts. (These figures secured conference to which United States Shipping Board is a member.)

riving in the United States the nuts are handled across terminal of entry and is paid. They are then rehauled and rewarehoused for a time or loaded on rail- cars and transported to their final destination at once.

thout going further into the matter it can easily be seen that such an intricate costly process of marketing under the unstable and speculative conditions of national trade can not be accomplished at a cost that will permit a promiscuous r of low-priced foreign peanuts. And certainly peanuts so handled can not be in American markets at a price unfairly competitive with peanuts grown in the h at a cost of 3½ or 4 cents a pound.

the foregoing comparisons we have used the moderate tariff rate provided in the act of 1913. It is therefore evident that the imposition of any additional duty ever will undoubtedly restrict peanut importations proportionately or raise the the consumer must pay, or both.

urth point: "The losses of domestic producers can not be ascribed to the com- ion of imported peanuts, as all agricultural commodities suffered similarly during cent slump in prices."

e of the points most emphasized by domestic shellers in their efforts on behalf igh tariff rate has been the argument that the loss caused the peanut grower by ecent price drop was due to the absorption of the market by foreign peanuts. bstantiate this argument they have referred to sales of imported nuts on this for 2 cents a pound, the inference being that such competition demoralized the et and caused domestic producers an enormous loss.

s hardly logical to consider importers, controlling but 10 per cent of the market- peanuts, to be responsible for the losses of holders of the bulk of the commodity. matter of fact, all agricultural commodities suffered a price decline, in many far more serious than the slump in the peanut market. Cotton and grain are ples.

en, too, the lowest recorded sale was for 2.8 cents a pound. This figure was ed for a thousand tons of off-grade nuts that cost the importer 9½ cents c. i. f. e. It will be noted in connection with this and other low-priced sales that these ctions all resulted in a loss to the importer and not a profit. When the domestic et slumped, importers were caught with stocks that they could not unload at rice of the more readily salable domestic nuts and were forced to liquidate at far below costs of production or importation. The committee may rest assured here was no element of profit to the importers in such sales. The failure or

forced retirement of four-fifths of the war-born Pacific coast importers was necessita
by the tremendous losses sustained during this period.

It is evident that in blaming the importers for their losses domestic producers h
again lost sight of the economic basis of all business and their attempt to secure
lative regulation of economic laws will prove equally in error.

Fifth point: "Already favored by a superior product, bringing higher p
domestic growers will obtain additional protection against any possible futur
vantage of foreign producers by a return to normal conditions, the standardizati
processes, and the improvement of marketing methods."

We have already shown from the admissions of the domestic producers them
that peanuts raised in the United States are preferred by buyers to the foreign
to the extent of bringing a slightly higher price, grade for grade.

It is our further contention that besides this advantage over foreign competi
domestic producers will gain an additional degree of protection with the retu
normal conditions and the development of the industry in this country that is
come from the efforts of the growers to produce and market their crops more effic

The research work spoken of by Mr. George Carver, technical expert of the
(House hearings, p. 2070), is an indication of the attitude of the industry, and i
are not already under way to bring about a standardization of methods, a more
system of grading, more intensive annual marketing campaigns, and other coop
activities such as have been conducted with such success by California asso
of producers of almonds, walnuts, and fruits, such steps must shortly be taken

The vigorous efforts of the domestic peanut producers to obtain tariff conce
that will stifle outside competition and give domestic growers a corner on the
market is an evidence of the strength of this half-century-old industry and of its
to hold the market it already controls.

The continuation of the American importers' privilege of filling the unsup
demand that always has remained after the absorption of the American crop
inure to the benefit of the consumer without any but a fair competitive effect
domestic grower, who is well favored in such competition by his geograph
economic advantages.

Sixth point: "The proposed duty is so prohibitive as to amount to a virtua
bargo."

It has been so frequently stated by domestic producers that foreign peanuts can
a duty of 2, 3, or 4 cents a pound that it is necessary to briefly analyze this content

We have already shown that, due to the peculiar marketing process through
imported peanuts must pass, the cost of landing the nuts in the primary mark
the United States under normal and abnormal conditions is practically the sa
the laid-down costs of domestic nuts in the same centers.

We have also shown that the only reason imported nuts have ever been b
in has been to meet an unsupplied demand that domestic nuts could not fill, a
only price that has ever been received for their sale that has netted a profit
importer has been a price but slightly under the price enjoyed by the domes
that controls the market.

Yet during the hearings on the emergency act the charges were again made
imported nuts were produced for 1 or 2 cents a pound, and transported at a negli
cost, therefore well able to stand a 3-cent per pound rate.

The effect of the emergency act on peanuts has been all that the importers proph
Although the 1920 crop was of much better quality than that of 1919 (House hea
p. 2064) and therefore better able to stand tariff restrictions than is usually th
with imported peanuts, imports since the 3-cent duty became effective have b
below the volume received during the same period last year.

As an example, during the month of July, 1921, 15 tons of peanuts entered the
of Seattle. During the previous month, 1920, 2,200 tons came in. Comment on
figures is unnecessary.

Statistics for the entire United States are not yet available for July, 19
advance information in the hands of your committee probably shows that the
gency act has cut importations of peanuts to about one-tenth of the volum
entered the country during July, 1920.

If there were no further facts to confirm our statements as to the cost of
foreign peanuts here, the enormous loss in tonnage received since the enactment
emergency measure would show conclusively that these costs are not the
arbitrary charges domestic growers have always claimed, but represent the a
of getting the goods to market. These costs can not be controlled by the importer
supplier, and the only result of an increase of the duty above ½ cent per pou
reasonable rate, will be to keep out foreign nuts and give the southern g
corner on the home market.

t is hardly necessary to further point out that with an excessive price for peanuts, ir use would be confined entirely to confections and the higher-priced foodstuffs, is shutting off outlet for the nuts in the many and varied industries that a reasonable ce on peanuts would make commercially possible. (See testimony of Mr. George ver, House hearings, p. 2070.)

eventh point: "By giving manufactured peanut products a lower duty than raw nuts, the proposed rate will seriously discriminate against American industries."

lealizing the necessity for foreign peanut oil to augment our own production and nish a badly needed raw material to our industries, the House has attempted to iove the embargo on the oil that exists in the emergency act, and, although it is true reduction that has been made is wholly inadequate for the purpose, it is an indi- ion of the justice of the importers' claims.

s the bill now stands, a most unjust and indefensible ratio exists between peanut dutiable at 2½ cents a pound; peanut cake and meal, free; and the raw peanuts n which these products are made dutiable at 3 and 4 cents a pound.

n the past it has always been the purpose of Congress to encourage manufacture or er refinement of foreign raw products in this country, in view of the beneficial ct it would have on our industries. That this administration's tariff policy should bunded on an opposite aim is unthinkable.

Ve therefore urge that the tariff on peanuts, shelled and not shelled, be reduced to oper proportion of the rate on peanut oil, for which a very nominal tariff has already n requested.

ighth point: "Restrictive duties on peanuts will injure our trade relations with mising foreign buyers of American manufactured products."

'hat success in foreign commerce is vital to America's future expansion is an ac- ted fact. The Departments of State and Commerce devote a major share of their rts to its promotion. Congress in enacting the Webb-Pomerene, the Edge, and es bills, in establishing the Shipping Board, and in countless other ways has icated its desire to aid in building up this trade. Chambers of Commerce, trade ciations, magazines, even universities, throughout the country are cooperating every way possible to stimulate public thought and interest along foreign trade s. and the result is that for the past five years one of the few things upon which American people have been united has been the importance of foreign trade and necessity for its encouragement. Yet it is a fundamental economic law that ween nations that engage in foreign trade there must be a reciprocal exchange of imodities.

merican importations of oriental peanuts to fill the unsupplied demand of our ket, place American dollar credits at the disposal of the Chinese and Japanese. se credits can be used, and are used, to purchase American machinery, textiles, her goods, lumber, grain, and all the articles required by the enormous popula- s of Asia, where the trend of modern civilization has just begun and where oppor- ities for American industries are perhaps more promising than in any other sec- of the world.

he statement that legislation penalizing foreign commerce will prove a boomerang Imerican industries is not merely a warning but an accomplished fact. Partly to the severity of the emergency act on important oriental imports, a large part he valuable export commerce that passed through the port of Seattle has been Statistics of the Seattle port warden, who keeps a record of all import and export age passing through this city, show a decrease in the volume of goods exported this port of 3,000,000 pounds a day, representing a daily loss of trade valued at),000. This comparison is made with figures for July, 1921, and July, 1920.

uring June, 1921, according to statistics of the Bureau of Foreign and Domestic imerce (July figures not yet available), total exports were but one-half of what were during the month of June, 1920, a loss of trade valued at $300,000,000. Such normous restriction of commerce, caused in part by a bill covering only a scat- ng list of commodities, emphasizes the truth of the warning that the industries he United States will pay dearly for any tariff subsidies granted for the benefit referred groups.

inth point: "Our merchant marine and the domestic side of importing represent dreds of millions of dollars in invested capital and thousands of American citizens— industry that deserves the same consideration given to other lines of domestic ness."

considering legislation affecting the importer it is not always remembered that import and export and shipping industries and their many allied interests com- e a huge domestic business, in which millions of dollars of capital is invested on which hundreds of thousands of our citizens are dependent.

It will be remembered that our Government has a great deal tied up in a mer[illegible] marine that depends upon the import and export industry for its very exist[illegible] that many municipalities as well as private concerns have spent enormous sum[illegible] the construction of terminals to handle overseas commerce; that the number of man[illegible] facturing plants operating exclusively on foreign orders is large; that marine insura[illegible] companies, customhouse brokers, etc., most usefully engaged, depend upon fore[illegible] trade as much as do importers and exporters themselves.

To return to the subject of peanuts; imported peanuts and peanut products must [illegible] transported, handled, weighed, inspected, stored, manufactured, and market[illegible] through domestic channels, bringing revenue to all the domestic interests so engag[illegible] We submit that the domestic side of this important industry also merits protection.

Tenth point: "The principal nations of Europe have placed reasonable rate [illegible] duty on peanuts and peanut products, an example that should influence sim[illegible] action by the United States."

One of the strongest facts that can possibly be advanced to support our request [illegible] a maintenance of the rate provided in the tariff act of 1913 is that our principal for[illegible] competitors in world trade, although producers of peanuts themselves, have n[illegible] theless placed reasonable duties on peanuts and peanut products.

England, France, and Germany, who fully recognize the value of the Asiatic mar[illegible] kets, are putting merely nominal restrictions on the entry of the principal orie[illegible] raw products, peanuts, and peanut products among these.

England, with a vast acreage under peanut cultivation in British West Afr[illegible] imposes no duty whatever on peanuts or peanut oil.

France, controlling one of the most productive peanut-growing sections of the wor[illegible] Senegal, West Africa, which ships through the great Marseille market, admits [illegible] nuts produced in the Orient free and assesses the oil only 23 francs per 100 kilogra[illegible]

The rate of duty on raw peanuts in Germany is 4 marks per 100 kilograms, and [illegible] oil, 12 marks per 100 kilograms.

This action on the part of the nations referred to has already given them an adva[illegible] tage over American competitors for the markets of the Orient, as they have be[illegible] enabled to extend the advantage in trade relations given them by their purchase [illegible] Chinese and Japanese raw products to benefit their sellers of fabricated goods. Fre[illegible] quent sailings from the Orient to Europe by vessels carrying peanuts and other ra[illegible] materials provide cheap and convenient steamer space to transport German, Fren[illegible] and English manufactured goods to the Orient on the return trip.

From this precedent, established by our foreign competitors, alone, your commi[illegible] would be justified in striking out the unreasonable 3 and 4 cent peanut rates, [illegible] when the many other facts that have been shown in the foregoing brief are considere[illegible] a return to the reasonable rate of the tariff act of 1913 is seen to be imperative.

(Indorsed by the following: Port of Seattle Commission, W. T. Christensen, pre[illegible] dent; Importers and Exporters Association of Seattle, H. A. Kimball, presid[illegible] Customhouse Brokers Association of Seattle, W. G. Houseman, president.)

STATEMENT OF J. B. PINNER, REPRESENTING THE PEANU[illegible] INDUSTRY, SUFFOLK, VA.

Mr. PINNER. Unaccustomed to address a body like this, I s[illegible] have to crave your kind indulgence, and I can say that the remar[illegible] make will have one merit and that will be the merit of brevity.

We have filed with the committees of the House and the Se[illegible] our briefs. We do not know that we can add very much to th[illegible] briefs except to call your attention again to them and to request [illegible] they be perused once more.

I am representing to-day the growers of peanuts in their [illegible] state and the millmen, the shelled peanuts and the peanuts in [illegible] shell.

We think that if you contemplate for one moment the neces[illegible] of some protection to the American grower you will find that we a[illegible] representing perhaps an investment in the business of about $[illegible] 000,000. We are representing about 110,000 heads of farmers' fa[illegible] lies in the South who grow peanuts, about 10,000 people who a[illegible] engaged in the milling of peanuts, for peanuts can not be sold imme[illegible] diately from the farm but have to go through a process of milli[illegible] in order to be placed upon the market; that is, peanuts for the [illegible]

se of roasting and for the shelled peanuts which go into the con-
tions and by-products.

Therefore, we think that it is an industry which should be carefully considered in all of its relations, and we find that we are opsed by the importations of peanuts from China through Japan, d our contention is that it is impossible for our American farmers the Southland where peanuts are grown to compete with the iatic labor and with the cheap ocean freights and sell our product anything like cost of production.

Senator SMOOT. Are you changing the request made by others as the amount that should be imposed on peanuts?

Mr. PINNER. No, sir.

Senator SMOOT. What are you asking for?

Mr. PINNER. We are asking for 4 cents a pound.

Senator SMOOT. For the shelled and unshelled?

Mr. PINNER. Shelled and peanuts in the shell.

Senator SMOOT. The House gave you 3 cents a pound for unelled and 4 cents for shelled?

Mr. PINNER. Yes, sir. We are asking 4 cents on both of those. e find that there has been a very large importation of peanuts om year to year from China, until 1920 it resolved itself into enormous amount of 120,000,000 pounds of shelled peanuts and 000,000 pounds of peanuts in the shell which came into this coun- in 1920.

The condition of our peanut growers is deplorable at this time. ere is not any question about the fact that we have arable land itable for the cultivation of peanuts equivalent to about 9,000,000 res, which can supply all the peanuts that we need in this country r all the demands which have arisen and which will likely arise. e are asking not for a prohibitive tariff; we are asking that there ll be just an equalization comparable with conditions of produc- the peanuts abroad and that of the production of peanuts in this untry.

Senator McCUMBER. Will you explain why you make no difference your request between shelled peanuts and unshelled peanuts, but for the same tariff on each?

Mr. PINNER. Well, because the prices have been just about the ne for shelled and unshelled because the production and the mill- will be about equal as they are put out to the market.

Senator McCUMBER. Is that because you use a different kind for se which you shell?

Mr. PINNER. Yes, sir; and those that are in the shell. We have use the largest peanuts for the roasting purposes, and the shelling ck is the lower grade, but the cost is about the same.

We have raised this year, under adverse conditions, about 4,000,000 gs of peanuts. That has supplied and will supply, without the portation of a single bag from anywhere, all that we shall demand.

Senator McCUMBER. How many pounds are there to the bag?

Mr. PINNER. In the farmer's hands good Virginia run from 70 85 pounds to the bag.

We find that the price of peanuts now absolutely is so low that actically our farming element who raise peanuts are in desperate aits. They are unable to pay their bills; they are unable to pay ir taxes; they are unable to pay their debts to the banks. I have

just learned, in fact, that some of our farmers have absolutely at this Christmas time had to withdraw their children from school and put them to work. They are not clothed properly, and they are in bad condition; they are in distress, gentlemen, and were it not for the support which the War Finance Corporation has brought to this present crop we do not know where our peanuts would have gone. We could not have used them at all; they would have gone possibly into the feeding of hogs or some other similar uses. The War Finance Corporation has made arrangements for the advancement of $1,000,000 to the Peanut Growers' Exchange, who are farmers organized for the purpose of not doing anything, as I understand it, except to prevent the glutting of the market at times during the season, and to try to hold the price at some point where it will enable them to live and produce peanuts.

Senator JONES. Have the operations of the War Finance Corporation resulted in raising the price of peanuts?

Mr. PINNER. It has not, sir, on account of the fact that we have produced so many peanuts this year. A great portion of the South has been driven to the culture of peanuts by reason of the invasion of the boll weevil, and they found that peanuts were a substitute which was very helpful.

But, in addition to that, we had a larger acreage planted to peanuts this last season—20 per cent increase, perhaps, in the acreage, and the yield was very much larger than was anticipated; and in order to avoid the glutting of the market, the Peanut Growers' Exchange, which is composed of 5,100 farmers of the country, have applied to the War Finance Corporation to relieve them, if possible, and to keep these peanuts from being thrown upon the market. But despite that fact the prices are low and below the cost of production at this time, which has produced this distressing condition which we have referred to.

Senator JONES. I just wonder how that can result in any permanent benefit to the peanut producers.

Mr. PINNER. It will result in this benefit—that we will be able, possibly, to so increase the demand or regulate the demand for peanuts that the farmers eventually, months from now, in the early part of the summer, will be able to have a price for their peanuts. But if thrown on the market now it will be disastrous to them.

Senator SIMMONS. You think that lowering the price is due to the importation of foreign peanuts?

Mr. PINNER. Yes, sir. I think you will find an answer to that in the effect that the emergency tariff bill has had. You take the Pacific coast, for instance, from which we have heretofore been practically excluded by the importation of peanuts, for the last six months of the year 1921, from June until December 1, we have been able to sell on the Pacific coast about 2,634,000 pounds of peanuts, while for the six months preceding that we were only able to sell about 645,000 pounds. They practically excluded us from the Pacific coast.

Senator SIMMONS. Can you give the committee the American production of peanuts?

Mr. PINNER. That is variable, sir. It has increased——

Senator SIMMONS (interposing). This year.

Mr. PINNER. About 4,000,000 bags, according to our estimates

Senator SIMMONS. How many bushels to a bag?

Mr. PINNER. Well, 30 pounds to a bushel.

Senator SIMMONS. You said 4,000,000 bags?

Mr. PINNER. That is, 4 bushels to a bag; 22 pounds of Virginia anuts make a bushel and 30 pounds of Spanish peanuts make a shel.

When I spoke about that, perhaps, I have localized it too much, nator. I had in mind our own production of Virginia peanuts in rginia and North Carolina. I have not the data for the producn of the Spanish peanuts in the States of Alabama and Georgia. vas only referring to the States of North Carolina and Virginia; t you can add to that, of course, all of the production of the uthern States—Georgia, Alabama, Oklahoma—where they raise a all quantity—and of Texas.

Senator SIMMONS. Virginia produces how many bags?

Mr. PINNER. Virginia and North Carolina produce 4,000,000 bags peanuts; that is our estimate; it is a very difficult proposition to t at.

Senator SIMMONS. That is about 16,000,000 bushels.

Mr. PINNER. Yes, sir. It is a very difficult proposition to get at e actual production of peanuts; but we only have to estimate that om the best information we can get, because every farmer pracally has his own warehouse. This year we have been able to get it very close, because the organization known as the Peanut Grows' Exchange, who send their peanuts under local management to e warehouses in various cities, have gathered the information. hey have, perhaps, already sent to them about 600,000 bags, and ey say they control a million bags.

Senator SIMMONS. It would be safe to say if these two States proice 16,000,000 bushels there is something around 30,000,000 or ,000,000 bushels produced in the United States?

Mr. PINNER. I suspect so.

Senator SIMMONS. Do you think that the emergency tariff is not ifficient?

Mr. PINNER. We do not, sir. We undertake to get the rate, for hich we ask in this tariff bill, from the best information we could ave as to the cost of production in this country as compared with ie cost of production abroad.

Senator JONES. As to the consumption, according to the colloquy which I have just listened, we produce in this country about 35,-)0,000 bushels of peanuts a year. That is about one-third of a bushel more than one-third of a bushel for every inhabitant in the United tates. Do we consume that many peanuts?

Mr. PINNER. I hope so. I hope that they will do so, if they do not lready. We have a very large crop this year, perhaps the largest e ever had.

Senator JONES. Have we ever exported any peanuts?

Mr. PINNER. A very small quantity. Our exports of peanuts do ot amount to anything. I have it set forth in the brief. The export f peanuts is limited. We only exported in 1920 about 14,000,000 ounds, and we have not done any exporting at all in the last two ears. It is impossible for us to do that on account of other condiions in reference to the exporting of any goods.

The American producer of peanuts feels that he is entitled to an should have protection.

I wish to say, incidentally, gentlemen, that the peanut, as yo know, had a very humble origin. It has been a symbol of the thing which are small in this life. It has grown into prominence as a ver valuable food, a food which practically contains all the elements o sustenance.

Senator SIMMONS. The importation of peanuts seem to be very very small now.

Mr. PINNER. The emergency tariff bill has practically saved us so far as that is concerned. In addition to the large crops we hav produced, if we have the importation of Asiatic crops, it is impossibl to tell where we will be. There is still a very large quantity left i the ports of Seattle and San Francisco, and possibly Vancouver, o the foreign peanuts brought in before, but at very high prices, an they are waiting before they do anything with them.

Senator SIMMONS. You recognize the fact that for a little whil there has been a constant diminution in the amount of peanuts im ported into this country. That was going before the emergency tariff?

Mr. PINNER. Imported into this country?

Senator SIMMONS. Yes. Before the emergency tariff it was show upon the floor of the Senate that since the armistice, in the late years, the importations of peanuts had fallen off very greatly.

Mr. PINNER. You are speaking about the importations?

Senator SIMMONS. Importations. I am referring now to the si months before the emergency tariff law was adopted—six month immediately preceding the adoption of the first emergency tariff act the importations of peanuts had greatly fallen off.

Mr. PINNER. Would you care for the figures of the Departmen of Agriculture? They are in the brief. You will find the revers of that—and that there has been an increase of importations fro year to year, until in 1820 we had this enormous amount.

Senator SIMMONS. What I mean to say is that it was clearl shown when the emergency tariff act was passed that during the si months immediately preceding the passage of that act, from mont to month, the amount of peanut importations had fallen off, and im mediately before that act was passed the importation of peanu was very small.

Mr. PINNER. But you must take into consideration that the Unite States placed an embargo.

Senator SIMMONS. That was after the war; there was no embargo at that time.

STATEMENT OF EDWARD EVE, CHARLESTON, S. C.

Mr. EVE. Mr. Chairman and gentlemen, it is a big subject y have given me, and I do not propose to try to cover it. I just was to add a word or two of testimony as to the condition of our south farmers and their needs, not only in Virginia, as Mr. Pinner pointed out, but throughout the South and the Southeast part larly. The growers of peanuts and the growers of cotton, the sel of the cotton seed—I want to make an appeal for some relief these men in their present conditions. I was raised a farmer, a

n still a farmer at heart, and I am in close sympathy with the
:oblems of the farmer, and I realize now that they are in desperate
:ed on account mainly of the boll weevil having knocked out the
op and made cotton unprofitable in the Southern and Southeastern
:ates, and foreseeing the boll weevil encroaching on the South
arolina territory, I have been boosting the growing of peanuts there
a substitute crop, feeling that that was the best crop available
id the most practical thing.

Senator SMOOT. Are you speaking for peanuts?

Mr. EVE. I am coming to oil.

Senator SMOOT. What are you asking for?

Mr. EVE. I think that a duty of 4½ cents would be ample pro-
ction. The peanut planters have had a hard time since the war
'ices have declined, and they really need protection against the im-
rtation of Chinese peanuts—Chinese peanuts, which came in in
ch volume that it put the price down to where it is not profitable
grow them, as you all know, at that present price, that neither
e oil mills nor the shellers can pay for them; and I think that
e duty as suggested would solve this problem. I think that the
ity that we have this year is the only thing that saved the peanut
ower from being absolutely wiped out. I think that the peanuts
ould be coming in here now and reducing the price even lower than
is, though it is below the cost of production. I want to make refer-
ce to an argument that is going to follow—the announcement of
e Interstate Cottonseed Crushers' Association favoring the repeal
taxes on oils. I think that the importation of peanut oils and
ier vegetable oils is in competition with the production of peanuts
d cotton seed in this country, and I do not think that the arguments
at these refiners and the importers put forward are valid. When
ey are given, I ask that you scrutinize them very carefully. I
lieve that the fact that they propose to import oriental oils here
d refine them and put the finished products in Europe will act
st the opposite from the way they predict—instead of putting the
ice of oil up in this country and in Europe that it will be an addi-
nal seller in the European market.

Senator JONES. Do you represent the producer of the oil—the
lls?

Mr. EVE. Yes; the shellers of peanuts and the producers; and I
nember of the Interstate Cottonseed Crushers' Association and Pea-
t Association.

Senator JONES. Do you export any of your product?

Mr. EVE. No; we simply crush and shell and sell locally. Gentle-
n, that is the point I want to make, that when we import these
s and pass them on to Europe and put two sellers there, I believe
will depress the European market more than it has now, and
at will have a bad effect on our own market, because Europe can
w buy from the Orient and they can not buy from us. But, if
can get the oriental oil here and sell it to Europe through this
intry, where it will put two sellers on the European market, it
uld have a depressing effect there; and that is the reason, I think,
at their argument does not hold water.

Senator JONES. Your argument means this, then, does it not: That
u are only going to produce enough to supply the American mar-
t, and you want control of the American market?

Mr. EVE. That is the idea.

Senator JONES. I know of no way that you come in competitio with these oils which find a market in Europe.

Mr. EVE. I think with the reduced cotton crop that we are not going to produce more in this country than we need here. We can practically consume it all here. We do not need oriental oils and we need protection.

Senator JONES. What I mean is that you will not have a surplus of any oils for export, and therefore the gentleman who told us the other day that the tariff was interfering with the foreign market for these American-produced oils did not have a valid argument.

Mr. EVE. I do not see how our tariff can interfere with the foreign market. They assume that the foreign retaliatory duties are going to be taken off if we would take off duties on oil.

Senator JONES. You do not want the duty taken off of oil, as I understand it?

Mr. EVE. No.

Senator JONES. Then, how do you expect them to take off their duties?

Mr. EVE. I am saying that the argument of the importers and exporters is that we take the duty off of oil coming into this country so that other countries will take off the duties they have put on our oils. But we get our oil from the Orient and we ship to Europe, a different market altogether. I do not believe Europe will reduce their duties because we reduce ours, or take their duties off.

WALNUTS.

(Paragraph 758.)

STATEMENT OF C. THORPE, REPRESENTING THE WALNUT PROTECTIVE LEAGUE.

Mr. THORPE. I represent, gentlemen, the Walnut Protective League, which is an organization comprising the growers and shippers of over 90 per cent of all the walnuts produced in America, and which handles simply the industrial problems, such as freight rates and tariff problems and all matters pertaining to the industry generally except the marketing problems.

The walnut industry is perhaps larger than most of us in the East realize. There is at the present time over $110,000,000 invested in the walnut industry in the United States. The annual value at wholesale prices of the crop at point of origin is over $12,000,000 annually. There are over 90,000 acres devoted exclusively to walnut culture on the Pacific coast alone, and of these 65,000 acres are now in bearing.

The American producer is supplying to-day over 70 per cent of the total consumption of walnuts used in America.

I am talking now of and will confine my remarks to unshelled walnuts. We are asking a duty of 4 cents a pound on unshelled walnuts and 12 cents a pound on shelled walnuts.

Senator WATSON. You speak of the English walnut altogether?

Mr. THORPE. Yes, sir. I am going to confine my remarks to unshelled walnuts for the reason that I appreciate the courtesy

:aring us out of turn and I could not cover both items effectively. he unshelled walnuts represent over 90 per cent of our output in is country, and while it will take fully the 12 cents asked for to velop the shelled-walnut industry to any perceptible extent, owing the limited time I will cover it more fully in the brief that I will e; so that I shall speak now just of the unshelled walnuts.

Senator WATSON. If you will let me interrupt you: Can you give a computation of the difference in production cost and——

Mr. THORPE. I have that, Senator, and I am just about to cover it. The imports are generally from China, France, and Italy. China, to recently, has been a small factor but is coming ahead so fast at in the last reports that we have of imports for 1919 there origi- ted in China, imported to this country, over 9,000,000 pounds of lnuts, which are about one-third of all of the importations. The stricts in northern China where walnuts are produced are not as ickly settled as in the main part of China. There is less room for pansion there, but there are unlimited areas suitable for producing lnuts in the portion of China from which the importations are made, d with the coolie labor they can raise them at a small fraction of r cost. ' The labor cost is what we base our contention for a higher riff upon. We have not considered the value of land and have not ured in interest on the investment. We have not figured the cost fertilizer and irrigation or horse power—simply the actual out of cket labor cost of producing a pound of walnuts, amounting to 9.73 nts a pound. That is the out of pocket cost to the grower, what he ys for his labor to produce that pound of walnuts.

In France that cost is 2½ cents a pound. In Italy it is less than 1 nt a pound, and in China slightly over one-half cent a pound.

The average difference in the labor cost of producing a pound of lnuts in America as between the cost of the foreign growers is over ents a pound. We are asking only for 4 cents a pound duty, which resents only one-half the difference in labor cost. In other words, or could be twice as cheap in America as it is to-day and still we ld justify the 4 cents duty for which we are asking.

Senator WATSON. Then you are not satisfied with 2½ cents a pound?

Mr. THORPE. No, sir; 4 and 12 cents. That, I want to state, ntlemen, is the minimum under which we believe the American lnut industry can continue on a prosperous basis.

Senator SMOOT. Under the Payne-Aldrich Act of 1909 shelled lnuts took 9 cents a pound.

Mr. THORPE. There was no shelled walnut industry in the United ates at that time. There was not a pound produced in 1909.

Senator SMOOT. You had 3 cents a pound on the unshelled?

Mr. THORPE. Yes, sir. This duty that we are asking to-day of 4 nts on unshelled is only equal to the Payne-Aldrich duty when the ight is taken into consideration, which has advanced 1 cent a und.

Senator WATSON. What was your production last year?

Mr. THORPE. Fifty-six million pounds.

Senator WATSON. Are they produced anywhere else in the United ates than California?

Mr. THORPE. They are produced in scattering lots elsewhere, but ncipally on the west coast.

Senator WATSON. What were the imports?

Mr. THORPE. For 1920 the imports were over 38,700,000 pounds. Of unshelled walnuts the imports were 22,000,000 pounds as against a total production in America of 56,000,000 pounds.

Senator WATSON. Thirty-eight million imported?

Mr. THORPE. Shelled and unshelled. The unshelled alone were 22,000,000 as against our production of 56,000,000. The foreigner has the advantage over us in freight rates alone to the principal consuming centers in America of over 3 to 1. In other words, our freight to those centers is three times as great.

Senator SMOOT. You are counting as a center the Atlantic coast?

Mr. THORPE. Chicago and the West. He has an advantage of over two to one at Chicago.

Senator WATSON. Have you exhausted the possibilities of production? Could you produce more?

Mr. THORPE. There are 200,000 acres of land in California alone that is not now planting anything but annual crops that are ideally situated for the production of walnuts. It is a lifelong game. A tree has to be 10 years old before it reaches what would be considered a profitable production. It takes that long to bring it into profitable production, and it never reaches full bearing until it is from 15 to 20 years of age. So that a man has a heavy capital investment in the industry before he gets anything out of it. He can not rotate his crop as he can in other things. Our production is doubled, on the average, every four years. It is increasing more rapidly than any other agricultural product. The reason it is going ahead so fast is due to the encouragement we had under the Payne-Aldrich Act of 1909 up to 1917 or 1918. Then we had, even under the Underwood bill, a practical embargo as a result of the inability of the foreigners to import goods here owing to lack of shipping facilities. So that the industry thrived pretty well during that entire period, and there were a great many plantings. Within the next year or two we will be producing more than enough walnuts to supply the entire normal consumption in the United States and, in fact, our growers will soon reach the point where they are producing so much that it will reach the stage of market saturation, where we will so seriously compete with ourselves that we will have to take lower prices to keep consumption abreast with increasing production, regardless of foreign goods.

But this tariff that we are asking, which is the minimum duty that we believe the industry can continue to prosper upon, is not one which will embargo importations. They will import just as many walnuts under a 4-cent duty as they will under a 2½-cent duty; the only difference being that some of the poorer quality of the foreign walnuts that have been coming in will be held back and a better quality substituted for it, because the dealers can not afford to import off-grade stuff if they have to pay 4 cents duty and if they have got plenty of good stuff that they can bring over.

Senator WATSON. What is the average earning of an acre of English walnuts?

Mr. THORPE. $24 per acre. The cost of production, without figuring interest on the investment, is 14.97 cents a pound. The average price is 18 cents, or 3.03 cents a pound profit. The average bearing is 800 pounds an acre. When you figure out the interest on

e investment, it does not amount to anything, because walnuts ve to be produced on the highest-priced land where the climatic nditions are ideal and the soil is the best.

Senator WATSON. What wages do you pay in the industry?

Mr. THORPE. $4 a day. The Ways and Means Committee states ges in the far West as $4.61 about harvest time. Even if they re reduced to $2 a day we can justify a 4-cent duty. In my inion, wages never will come down to $2.

This tariff that we recommend will add to the revenues of the ited States Treasury one and three-quarter millions a year. We facing the most serious situation from China, as I have just plained. We are up against this Chinese cheap labor, and the ly way we can compete with it is by going on to the Chinese standint of living—dried fish and rice—and the American people do not nt to do that, and I do not think you want them to do it.

Senator WATSON. Let me ask you this: Under the Payne-Aldrich r there was a duty of 3 cents on walnuts not shelled and 5 cents on lnuts shelled, which was a slight differential. Under the existing v, the Underwood law, the duty is 2 cents, not shelled, and 4 cents, elled—2 to 1. Now you propose 4 cents, not shelled, and 12 cents, elled, or 3 to 1.

Why such a differential?

Mr. THORPE. As I explained a moment ago, there was no shelled lnut industry in America even six years ago, much less when any these other bills were considered. It is a new development. ere was not a pound of walnuts in California, even up to the last years. If you say 3 to 1, that is the differential that ought to placed on the product. However, the very important thing is at our business is unshelled walnuts. Over 90 per cent is now, d will be for some time, unshelled walnuts. We are in a little ferent situation from the almond industry.

Senator SHORTRIDGE. It is just the other way in the almond lustry.

Mr. THORPE. I do not know, but in the walnut business the shelled walnut is our principal product and always will be. It is e one that we are most interested in getting a tariff on and the one which we need a tariff the most. We can develop the shelled lnut industry if we get a 12 cent tariff. If we do not, it will be ghty slow coming up.

I may say that the walnuts we shelled last year netted the grower cents a pound and his cost of production was 15 cents, which was it a salvage; that is all you can say for it.

Senator LA FOLLETTE. Last year?

Mr. THORPE. Yes, sir. The importers will tell you that we have en getting outrageous prices for our walnuts. They mention only fanciest grades. Forty per cent of our crop never makes a fancy ide. We sold last season 40,000 bags that averaged us 14½ cents a und. We sold another 27,000 bags at 16½ cents a pound, and we ilized 49,000 bags in our by-product plant. They ran only 5¼ cents. the high prices that the importers talk about are not average ices.

The average orchard-run price that the grower got last year was ly a little less than 18 cents a pound.

In the walnuts that the importers send here from abroad there ar the good and the bad all together. They do not grade them out lik we do. There is the large and the small. They do not grade them for size like we do. As a rule they are inferior, naturally, to ou grading.

Senator DILLINGHAM. What is the by-product that you mention

Mr. THORPE. The walnut meats; and we make charcoal out of th walnut shells. We are perhaps the largest charcoal manufacture in the United States. We manufacture a very high grade of charco out of these walnut shells. They only return us $5 a ton.

Senator LA FOLLETTE. What is it used for?

Mr. THORPE. Chicken feed and medicine in the hog industry.

Senator LA FOLLETTE. What did you say you received for you best grade of walnuts last year?

Mr. THORPE. The price to the wholesaler was 22½ cents a poun for the best grade. The average price as they come from the growe is a little less than 18 cents a pound.

Senator LA FOLLETTE. Do you know how far east those walnut were shipped?

Mr. THORPE. To New York and all the eastern markets. W work pretty much on a per capita consumption basis. I think w have as thorough a distribution as any organization in the Unite States. Our cost of marketing is less than 3 per cent.

Senator LA FOLLETTE. Do you know what the transportatio charge was?

Mr. THORPE. $2.40 a hundred pounds for our shipments east Salt Lake City.

Senator LA FOLLETTE. For your best grade of walnuts you receive 22½ cents?

Mr. THORPE. Yes, sir.

Senator LA FOLLETTE. Was that a fine quality?

Mr. THORPE. Yes, sir.

Senator LA FOLLETTE. They retail for about 50 cents?

Mr. THORPE. Thirty-five cents.

Senator LA FOLLETTE. Fifty cents.

Senator SMOOT. I paid 50 and 60 cents.

Mr. THORPE. You can not gauge the price in Washington, D. It is one of the highest markets in the entire East. We have speci men who make reports on the different markets which they cov It averages over a hundred specialty men taking orders, and th average showed 35 cents a pound for pure No. 1 soft-shelled walnu

Senator LA FOLLETTE. Will you file with the committee a sta ment of the prices at the different points where your organiza gathered them?

Mr. THORPE. Yes, sir; I will be very glad to do that.

Senator LA FOLLETTE. I mean the retail prices.

Mr. THORPE. I might say in that connection that some retaile will charge 60 cents for the same thing that the others are hand at 30 cents.

Senator LA FOLLETTE. If you will work that out in detail we w be very glad to have it in the record.

Mr. THORPE. Through the perfection of our sales organization are placing walnuts in the hands of the consumer at only 35 per

iore than the producer receives, which is, I think, the closest margin nder which any nonperishable product is marketed.

Senator LA FOLLETTE. In the hands of the consumer, you say?

Mr. THORPE. Yes, sir; 35 per cent represents freight, wholeiler's profit and retailer's profit.

Senator LA FOLLETTE. In all parts of the country?

Mr. THORPE. Yes, sir. Take 35 cents a pound and 35 per cent off iat and you will have less than 22½ cents. They were handled last ear on just about 35 per cent margin. That includes freight, wholeiler's profit, and retailer's profit.

Senator LA FOLLETTE. How small an order would you fill?

Mr. THORPE. Any order from a hundred pounds up, to any legitiate wholesaler in the United States.

RIEF OF GEORGE R. SIEVER, REPRESENTING THE FOREIGN COMMERCE ASSOCIATION OF THE PACIFIC COAST.

Under paragraph 758 of the Fordney tariff bill walnuts, not shelled, are assessed a ity of 2½ cents per pound and walnuts, shelled, 5 cents per pound.

We respectfully urge that a duty not higher than that provided in the tariff act of 13, namely, not shelled 2 cents, shelled 4 cents, be fixed as the rate on this commod-. In support of this recommendation we direct your attention to the following ts, which will be taken up in detail herein:

1. As our domestic production is insufficient to meet the demands of our consuming irkets, the effect of any increase in duty will be to unnecessarily add to the price this commodity to the consumer.

2. The importation of foreign walnuts has in no way adversely affected the domestic dustry.

3. Domestic and imported walnuts are only indirectly competitive, as the great fference in quality between the two varieties confines the sale of each to a disictly separate class of trade.

4 An analysis of cost factors and selling prices of domestic and imported walnuts ows the domestic industry to have many advantages over importers which render rther tariff protection unnecessary.

5. An increase in the rate of duty on walnuts will injure our trade relations with portant purchasers of American products and adversely affect the many industries gaged in foreign trade.

First point: "As our domestic production is insufficient to meet the demands of r consuming markets, the effect of any increase in duty will be to unnecessarily d to the price of this commodity to the consumer."

Figures are given below showing the annual production of walnuts in the State of lifornia since 1909. This State produces over 95 per cent of the domestic walnut op. Figures on imports, compiled by the Bureau of Foreign and Domestic Comerce, are given in a parallel column.

In comparing the relative proportions of American and foreign walnuts consumed this country annually, the volume of shelled walnuts imported has been doubled place all figures on an in-the-shell basis. About 50 per cent of the weight of imported lnut meats is lost in the shelling process.

Year.	Foreign grown.	California grown.	Year.	Foreign grown.	California grown.
	Pounds.	*Pounds.*		*Pounds.*	*Pounds.*
9	26,000,000	18,700,000	1915	40,000,000	29,650,000
0	43,000,000	19,200,000	1916	48,000,000	29,200,000
1	43,000,000	25,000,000	1917	52,000,000	33,000,000
2	42,000,000	22,500,000	1918	29,000,000	40,230,000
3	36,000,000	22,700,000	1919	21,000,000	56,096,000
4	49,000,000	17,000,000			

These statistics show that while our domestic production has jumped from about per cent of our annual consumption to approximately 80 per cent in the past 10 ars, still we imported almost as many walnuts during 1919 as we did in 1909. In

the light of these figures it is apparent that we have not yet reached a stage [illegible] we can depend upon our own growers to produce the quantity of walnuts our [illegible] markets require, and therefore must import a substantial part of the walnuts [illegible]

It is evident that any duty whatever levied on these imports will fall on the [illegible]sumer as an addition to the price he would otherwise pay. On account of the [illegible]cial needs of the Government some duty is to be expected, but in the interests [illegible] consuming public it is respectfully recommended that such duty be fixed on as [illegible]erate a basis as possible.

Second point: The importation of foreign walnuts has in no way adversely [illegible] the domestic industry.

The statement is made by domestic producers that, while we must import a [illegible] proportion of the walnuts we consume, a higher tariff should nevertheless be [illegible] to prevent our markets from being swamped with foreign nuts and our home [illegible] from being ruined.

During the last 10 years, under varying conditions and different rates of duty, [illegible] American walnut industry has practically trebled its annual production and [illegible] than trebled the price per pound received by the growers for their crops. And [illegible] be noted that the industry has grown faster during the last five years under the [illegible] recommended in this brief for readoption than during the years when a higher [illegible] was in force.

Last fall, according to their own statements before the Ways and Means Comm[illegible] the walnut people quickly disposed of their entire crop at 100 per cent profit [illegible] producers, being one of the very few agricultural industries to maintain the [illegible] their product in the face of declining values.

The fact that the walnut industry has so far not been adversely affected by [illegible] competition, but has thrived even under conditions disastrous to other agricult[illegible] industries is a very strong indication that the industry—well organized and power[illegible] as it is at present—will meet foreign competition equally as successfully as in the pa[illegible]

This is especially to be expected when it is considered that the annual produ[illegible] of domestic walnuts is still remotely distant from the saturation point of the indu[illegible] field for sales. Not only have growers been unable to keep pace with the [illegible] domestic demand for high-grade walnuts but they have not begun to exploit [illegible] markets.

To ship by water to European points costs the California shipper no more than [illegible] ship by rail to the eastern United States, and the best class of trade in Europe[illegible] countries should prove equally as receptive to the superior American product as [illegible] country has been.

Third point: Domestic and imported walnuts are only indirectly competitive [illegible] the great difference in quality between the two varieties confines the sale of each [illegible] a distinctly separate class of trade.

One reason why the American walnut industry has succeeded in the face of [illegible] foreign competition is the scientific cultural methods it has adopted and the pains [illegible] has taken to produce a really superior walnut.

Working through a most progressive and enterprising agency, the California Wa[illegible] Growers' Association, the growers have left no stone unturned to make walnut [illegible] a profitable industry and have succeeded admirably.

By growers' own admission at hearings of the Ways and Means Committee [illegible] American-grown walnut is much superior in quality and flavor to any of the imp[illegible] walnuts." The California variety is a clean looking, thin shelled, full meated [illegible] flavored nut. By an advanced system of grading, the quality is rigidly standard[illegible] to an average of about 95 per cent sound meats. Stimulated by intensive advertis[illegible] campaigns, the demand for these nuts is very large and is steadily growing.

On the other hand, imported walnuts are not produced under such ideal condit[illegible] and are inferior in quality to the domestic variety. This inferiority, it is tr[illegible] principally in the exterior appearance and physical characteristics of the nut[illegible] instance, the stained, hard, thick shell, closely adhering to the meat, like th[illegible] of the pecan.

Some of the references to the quality of imported walnuts in the brief of the Wa[illegible] Protective League, presented to the Ways and Means Committee, are not full[illegible] accord with the facts, and as a whole the brief is rather too severe an indictment [illegible] competitive product to be entirely trustworthy. However, with this qualificat[illegible] mind, growers' own statements are excellent testimony to show the valuable [illegible]petitive advantage represented by the superior quality of the American-grown wal[illegible]

The Walnut League brief (House hearings, p. 2036) refers to imported waln[illegible] "the unsightly, poorly cleansed, shrivel-meated, wormy, foreign nuts, which run [illegible] 20 to 30 per cent bad meats." It is evident that nuts of this description would [illegible] nearly as popular with buyers as domestic nuts, clean, attractively packed, and hav[illegible] 95 per cent good, sound, full meats.

1 House hearings, page 2037, oriental walnuts in which we are particularly in-
sted are testified by producers to be "of the poorest quality of any of the imported
1. They carry a hard, thick shell, the largest portion of the weight being in the
l, or nuts containing badly shriveled kernels. They have an insipid flavor * * *."
he average American buyer demands quality and will pay a premium to get it.
distinct preference of our buyers for domestic walnuts on account of their superior
lity would constitute complete protection to the American grower, even if foreign
lucers actually had the competitive advantages they are alleged to have.
he marked difference in quality between domestic and imported walnuts, while
as radical as growers claim, is sufficient to make competition very indirect.
alnuts are not like peanuts, for instance, which, imported or domestic, have the
e uses and are practically interchangeable.
he class of trade demanding domestic walnuts would not be satisfied with the lower
e oriental product. The housewife is quick to detect the difference in quality
een the two varieties. She does not like the thick shell, difficult to crack, and if
an afford to pay the price she will buy "soft-shell" walnuts exclusively.
the other hand, the class of trade using foreign walnuts could not afford the home-
n product. The field for marketing foreign nuts is among the working classes
among confectioners, bakers, and manufacturers, to all of whom the element of
is highly important. Imported walnuts, particularly shelled, are just as suitable
anufacturing needs as those grown in California, and as their low cost permits a
h wider sale of the product they in part compose than if the more expensive
stic variety were used, they are much in demand for commercial uses.
imported walnuts were shut out or restricted by an excessive duty, their users
l not afford the high-priced home-grown walnut and would be forced to discon-
or greatly restrict their walnut consumption.
is difficult to see any noteworthy advantages to any one to be gained by such a
tion. The growers' market would not be appreciably enlarged, the Government's
income would be proportionably lessened, and the business of manufacturers of
ucts containing walnuts would suffer materially.
urth point: "An analysis of cost factors and selling prices of domestic and im-
d walnuts shows the domestic industry to have many advantages over importers
h render further tariff protection unnecessary."
e of the principal contentions of domestic producers is that on account of lower
uction costs foreign growers have an advantage in the competition for American
ets. In their brief presented to the Ways and Means Committee most elaborate
lations were made to establish this point.
the course of their statement growers said that last year the cost per pound of pro-
g walnuts in the United Stateds was 15 cents. The items totaling this figure
: Cultivating, 9.92 cents; harvesting, 2.56 cents; packing, 1.37 cents; marketing,
cents.
exact computations were presented to show the cost per pound of producing
n nuts, but a detailed report of low labor costs, etc., was made. The inference
rse was that foreign walnuts could be produced for about one-third the cost of
ction in this country.
ile production costs are undoubtedly higher in America than in foreign countries,
ting costs are much higher on nuts grown in the latter. Items that do not figure
cost of selling domestic walnuts constitute a heavy expense to the importer.
of these are: (1) Risk from exchange fluctuations; (2) many profits taken by the
middlemen that play a part in the marketing process; (3) fluctuating ocean freight
(4) marine insurance; (5) import duty. These cost factors are of course in addi-
o the items of cultivating, harvesting, packing, and selling that enter into the
f both domestic and imported nuts.
ile it is not possible to establish the cost of production of foreign walnuts by exact
s, as was done in the case of the domestic variety, it is seen that the handicaps
mpede the process of marketing foreign walnuts would tend to equalize the basis
petition between the American-grown and imported product, even if the selling
of both varieties were the same.
: while the cost per pound of foreign walnuts delivered in our principal cities
far from the cost of placing domestic nuts in the same centers, the foreign variety
ot be sold at or near the price enjoyed by the higher grade, home-grown product.
evident that domestic and foreign walnuts of such distinctly different character-
must be sold at prices commensurate with their respective qualities. In other
, with a greater percentage of waste to the pound, more difficult to crack, and
g other disadvantages that domestic walnuts do not have, the foreign variety must
prices proportionally lower.

Under these conditions foreign nuts that cost the importer almost as much to la[nd] here as domestic nuts cost the grower to produce, must be sold at prices from 30 to [...] per cent lower than those received for domestic nuts.

Last year, as has been noted, the domestic crop that cost 15 cents per pound to [...] harvest, pack, and market, was quickly disposed of at 30 cents per pound f. o. b. [Cali]fornia points by the producers themselves. By growers' figures (House hearings [...] 2040) oriental walnuts sold at an average of 14 cents per pound. Sixteen to 19 [...] per pound spot Seattle or San Francisco would be more nearly correct, but [...] figure shows significantly the fact in connection with these comparative ma[rket] prices that we particularly call to your attention, namely, that while domestic gr[owers] received a profit of 100 per cent on their product, importers against whom the[y de]mand protection, had to be satisfied with a profit of about 20 per cent. In the li[ght] of these facts, importers' alleged competitive advantages are conspicuous by [their] absence.

In their brief before the Ways and Means Committee, domestic growers ma[de] conflicting charges in connection with relative selling prices that deserve atte[ntion] here.

"Importers bring in walnuts at much less expense than domestic growers ca[n] [...] them here," they said. "Then, by padding their prices, importers 'ride' the do[mestic] market and exact huge profits." This argument was used to prove the point tha[t the] import business was conducted on such a broad margin of profit that a highe[r duty] would not diminish imports but rather increase revenues enormously.

In the same brief and in direct opposition to this, the charge was made that imp[orters] were viciously underselling growers and threatening to push their advantag[e to a] point where they would be able to absorb the market. To substantiate this c[harge] sales of walnuts were cited at prices as low as 3 cents a pound.

The actual situation, however, is midway between these conflicting posi[tions]. As has been said, imported walnuts sold at about 16 cents a pound, represent[ing a] very reasonable profit over actual cost. No evidence has been shown, or can be sh[own], that they "rode" the domestic market and sold at prices around 30 cents a p[ound]. Neither did first quality imported walnuts sell at prices as low as 3 cents per p[ound].

In support of the "underselling" argument, the growers' brief contained m[any] exhibits of sales slips and quotations of imported walnuts at around 5 and 8 ce[nts a] pound, the inference being that these covered first quality walnuts. As a matt[er of] fact, as growers were fully aware of, but carefully refrained from mentioning [...] quotations and sales reports covered "distressed lots," high in rancidity, pr[...] vermin infested, and certainly not of the first quality.

For example, in Exhibit F, of the growers' brief, a letter from Ariss, Campb[ell &] Gault of this city, who are incidentally local agents for the California Walnut Gr[owers] Association, reports a sale of a thousand bags to "a 5 and 10-cent store" at 5 [...] pound, which were retailed at 10 cents.

The certificate of grade upon which these nuts were sold was issued with the appr[oval] of this association after an inspection by the writer, of the lot covered, and, as [they] were with one possible exception, the poorest lot inspected during 1920, the wr[iter is] fully familiar with the details of their condition.

Their original owner becoming involved, they were sold at a sacrifice by the Ba[nk of] California to the Rhodes Bros. 10-cent store at the price reported. At the ti[me of] inspection, one nut in every five was in an advanced stage of decomposition an[d the] entire lot was on the verge of rancidity. A most disagreeable bitter oiline[ss was] predominant in the flavor, and a most unpleasant odor permeated the shipm[ent].

The use of selling prices of lots of this character to illustrate sales of import[...] below the market price of domestic nuts is most misleading.

As has been noted, the superior quality of domestic walnuts naturally [...] substantial premium, grade for grade, over the price of imported nuts. We [...] that this advantage of American growers, together with the numerous han[dicaps] suffered by importers, constitutes more than sufficient protection agains[t ...] competition and renders an additional duty wholly unnecessary.

Fifth point: "An increase in the rate of duty will injure our trade relatio[ns ...] important purchasers of American products and adversely affect the many in[...] engaged in foreign trade."

That success in foreign trade is vital to the expansion of America's industrie[s ...] accepted fact. The Departments of State and Commerce devote a major p[art of] their efforts to its promotion while Congress and other divisions of our Gov[ernment] have extended their utmost cooperation. Chambers of commerce, trade asso[ciations] and numerous other private agencies are likewise stimulating public inter[est ...] giving practical aid to American industries seeking to enter foreign fields.

Yet to succeed in foreign trade there must be a reciprocal exchange of comm[...]. It has long been understood that foreign buyers are unable to purchase A[...]

ds unless credits are established in their favor by the importation of their products; t transportation of American goods overseas can not be economically and efficiently iducted unless there is cargo both ways.

merican imports of walnuts to meet the unsupplied demands of our markets, vide this return movement and place American dollar credits at the disposal of opean and oriental sellers. These credits can be, and are, used to buy American chinery, textiles, lumber, steel, chemicals, grain, etc. It is evident that to injure trade relations with these countries by erecting a tariff barrier against their products ld be most unwise.

mportant as foreign trade is to our manufacturers, our merchant marine and our ort and export industry and its many allied interests depend upon it for their very stence. These industries comprise a huge domestic business, in which millions of ars are invested and on which thousands of our citizens are dependent.

t may seem far-fetched to point out in connection with the tariff consideration of one commodity the extent and importance of all foreign trade interests. Still walnut business is a part, and a not unimportant part, of this vast industry, and step tending toward the diminution of walnut imports will adversely affect to a ter or lesser extent all these interests and many lines of domestic business in ition. Imported walnuts, besides being handled by the importer, must be transed, inspected, and analyzed, stored, manufactured, and marketed through estic channels, bringing revenue to all domestic interests so engaged. These are rtant lines of domestic business and we respectfully urge that the same protection given them as is given to other domestic industries.

FLAXSEED AND FLAXSEED OIL.

[Paragraph 760.]

TEMENT OF HON. EDWIN F. LADD, UNITED STATES SENATOR FROM NORTH DAKOTA.

enator McCUMBER. Senator Ladd, as you have made a special ly of every agricultural question as president of an agricultural ege in the State of North Dakota, and as you are giving special sideration to the cereal question, the committee has felt that they ld rest the matter of the agricultural schedule a great deal upon r views without calling for additional evidence, and so I will you to be just as extensive as you desire on any part of this ect.

enator LADD. Mr. Chairman, first I would take up and refer to schedule as prepared by the special agricultural committee, of ch Senator Gooding has the data, and say that I thoroughly rse and agree to the schedules there presented as desirable. I want particularly this morning to speak with regard to flax the flax industry.

eferring to paragraph 50, page 9, where the present schedule calls nseed, flaxseed, and raw oil, boiled or oxidized, 2½ cents per pound paragraph 760, flaxseed 25 cents per bushel, in the schedule for

1910 there was a tariff on flax of 30 cents a bushel and on oil of ents per gallon. At that time we were growing in this country 7,000 acres of flax, but in 1912 or 1914 in the revised tariff there a reduction, so that in 1920 the tariff on flax was 20 cents, but il it was 10 cents per gallon. In 1920, therefore, our acreage ted to flax was 1,785,000; or, in other words, in 1910 we were lucing 19,513,000 bushels of flax, and by 1920 we reduced the luction to 7,661,000 bushels in this country.

In 1910 we were importing only 5,000,000 bushels, in round num bers; in 1920 we were importing 23,000,000 bushels.

Under the present schedule, which is the emergency schedule, th flax industry and the crushers industry are practically destroyed. a the rate on the oil is only 10 cents per gallon as compared with 2 cents a bushel on the flaxseed. This permits them to bring in th oil at a very much lower figure than our people can produce it i this country. And in the first four months of 1921 we import 150,000 gallons, but in the next five months, after the emergenc tariff went into effect, we imported 2,999,000, and practically all the leading factories where flaxseed is crushed and oil extracted hav been closed down, because they can not import the seed, the oil bein imported so much cheaper. For that reason—I am speaking for th farmers of the Northwest, who have asked me to present this matter I feel that there should be a tariff of not less than 40 cents in pla of 25 cents on the flax and 3½ cents per pound on the oil; 40 ce on the flaxseed is not anywhere near as great a tariff at the pres time as the 30 cents was in 1910, nor as much protection afforded.

Senator McCUMBER. I think it proper to inject right here th the committees, in formulating the emergency tariff bill, inadve ently, as I believe, omitted to put in the proper differential betwe the flaxseed and the linseed oil, through fear of other amendme being added, and of greater trouble in passing it through both bodi it was thought best to leave that as it was until we could correct by the general tariff law.

Senator CURTIS. Will you state again the present tariff on oil?

Senator LADD. On oil it is 10 cents per gallon at the present ti as against 32 in 1910.

Senator SMOOT. You want 40 cents on the seed?

Senator LADD. We want 40 cents on the seed and 3½ cents pound on the oil.

Senator CALDER. What is it on the seed and the oil?

Senator LADD. It is 20 cents per bushel on the seed and 10 ce per gallon on the oil, and by so doing you have largely increa the imports and reduced the home production of flax over one-h as compared with 1910, and you have practically by this tariff ma it necessary for the mills that extract the oils to close down.

Senator SMOOT. On the flaxseed oil, raw and boiled, you want h much?

Senator LADD. We want 3½ cents a pound.

Senator SIMMONS. That is on the oil?

Senator LADD. Yes; 3½ cents a pound on the oil. That correspon to approximately 26 cents per gallon.

Senator SIMMONS. How many pounds are there in a gallon?

Senator LADD. In round numbers, 7.6 pounds; it varies, of cou That makes 26 cents per gallon, as against 10 cents per gallon at t present time and as compared with 32 cents per gallon in 1910

Senator SIMMONS. What does that oil sell for in this coun Senator?

Senator LADD. At the present time it is very low, but I thi can give you the figures going back; in 1901 it was $1.05.

Senator SIMMONS. A gallon?

Senator LADD. A gallon; but during the war it ran up, in 1918 $3.40; in 1919, $4.08; in 1920 it was down to $1.76, and at the pre time it is below $1 per gallon.

Senator SIMMONS. It is lower at present than it was before the war?

Senator LADD. Yes, sir; although before the war it did run down low as 84 cents, but I think it is below 84 cents at the present time.

Senator SIMMONS. You gave 1901?

Senator LADD. In 1901 it was $1.05; then it did go down to 84 nts. But in 1908 it was $1.18 and gradually increased along up to .74 in 1916; but in 1917 it reached $2.48; the following year, $2.96, d the following year, $3.40, then $4.08, while it fell back last year $1.76, and is now below $1 per gallon.

Senator McLEAN. Your statement contains a condition of the in- stry at the present time, I presume?

Senator LADD. Yes, sir; and I want to file a more detailed state- nt, which I will leave with the stenographer.

There are two reasons, it seems to me, that want to be taken into nsideration: If we destroy this flax industry by allowing it to go t of the country and the oil to be imported rather than the flax to grown in this country, we are going to destroy other industries as ll. The paint industry will be destroyed and go likewise to foreign untries; the varnish industry will be destroyed largely, and foreign untries, where there is cheaper labor and where this material is oduced, will dominate; and then will follow the linoleum industry. If we encourage the production of flax, we will take out of the eat-growing section 2,000,000 or 3,000,000 acres of land that will into flax instead of going into wheat and other cereals of which have a large surplus.

Senator SIMMONS. Senator, I did not hear the first part of your atement. Probably you have gone over it; if you have you need t answer my question. What did you give the annual production flaxseed in this country at?

Senator McCUMBER. It fluctuated, but it has been going down.

Senator LADD. In 1901, which is the earliest data we have, we were oducing in round numbers 17,000,000 bushels of flaxseed; but in 20 it was reduced to 7,661,000 bushels of flaxseed produced in s country.

Senator SIMMONS. What was the cause of that remarkable slump 1919 and 1920?

Senator LADD. There were two causes: First, in 1910 and before it there was a duty of 30 cents a bushel on the flax and 32 cents a llon on the oil. Now, that was sufficient to protect our American lustry.

Senator SIMMONS. Thirty-two cents or per cent?

Senator LADD. Thirty-two cents per gallon on the oil and 30 cents bushel on the flaxseed; and we were increasing the amount of produced, but when they reduced the tariff to 20 cents per shel——

Senator SIMMONS. When was that done?

Senator LADD. Along about 1912 or 1914, I do not recall the exact te—I am told it was 1913. Then we began to decrease the amount flax production in this country.

Senator SIMMONS. When did the reduction begin? You said in 10 you were producing 17,000,000?

Senator LADD. Yes.

Senator SIMMONS. When did the slump begin?

Senator LADD. Well, in 1912 we had 19,000,000 bushels; in 1913, 000,000 bushels; in 1914 we had 17,000,000 bushels; in 1915 we

had 13,000,000. Then for the two following years, 14,000,000; th during the war we stimulated and increased somewhat the productio But it fell back again in 1920, and was even less for the present yea than it was in 1920. I have not the exact figures for 1921.

And the other reason——

Senator McCUMBER (interposing). We changed the tariff in 1913

Senator LADD. Yes; it went into effect in 1914.

Senator McCUMBER. And prior to the 1913 law the tariff ha been what?

Senator LADD. The tariff had been 30 cents per bushel and 32 cent per gallon.

Senator McCUMBER. And that year before this law went in effect we raised 28,073,000 bushels?

Senator LADD. Yes.

Senator McCUMBER. The very next year, in 1914, we reduced it t 17,853,000; the next year to 13,749,000; the next year to 14,030,00 and 14,296,000; and it has been going steadily down grade ever sinc

Senator LADD. Yes, sir.

Senator SIMMONS. In the Payne-Aldrich tariff they did not chang the rate?

Senator LADD. I think not.

Senator SIMMONS. Senator, will you please give the importatio beginning where we do begin?

Senator LADD. In 1901 we had a shortage of a crop in this countr and we imported 1,631,000 bushels of flax; the following year, 479,0 then 179,000 and 213,000; and so it ran until we got up to the ti the tariff started in, and then it begins to increase from 6,000,000—

Senator SIMMONS (interposing). When?

Senator LADD. In 1912–13 it began to increase.

Senator SIMMONS. What were the imports in 1910?

Senator LADD. Five million two thousand bushels. But that sa year we exported considerable of oil.

Senator SIMMONS. In 1911 what were the importations?

Senator LADD. Ten million four hundred and forty-nine thousan

Senator SIMMONS. Jumping in one year from 5,000,000 10,000,000?

Senator LADD. This is easily accounted for, as in that year our fl production was a failure and we had to import more flax to offs We had had for 19 years before 19,000,000 bushels year after ye But that year our production was only 12,000,000 bushels.

Senator SIMMONS. That was 1911?

Senator LADD. 1911.

Senator SIMMONS. In 1912 what was it?

Senator LADD. Nineteen million.

Senator SIMMONS. Imported?

Senator LADD. No; yield I am talking about.

Senator SIMMONS. In 1913 what was it?

Senator LADD. In 1913 we imported 5,000,000 bushels and the fo lowing year 8,000,000. Then we began our rapid increase to 10,000 and increased up to the present time to 23,000,000 bushels impor tions of the seed, and during the year we have imported largely

Senator SIMMONS. And now the production this year is what?

Senator LADD. I have not got the figures for this year. For year we produced 7,761,000 bushels of flaxseed in this country.

Senator SMOOT. This year we are importing oil, because of the duty the emergency tariff bill and the lack of compensating duty to oil?

Senator LADD. Yes, sir.

Senator WALSH. How much oil is extracted from a bushel of seed?

Senator LADD. I think it is about 2½ gallons per bushel.

Senator SIMMONS. You were giving bushels just now?

Senator LADD. I was giving bushels.

Senator SIMMONS. This statement here, which has just been handed me, gives the imports for 1918 at 12,785,000. Is that what you re there?

Senator LADD. I have it 13,665,529 for 1918. The other reason for decline was the fact that at that time there appeared what is own as flax wilt, which destroyed flax after it was about 6 inches h, and a great deal of it died. There was an investigation begun develop flax that would withstand that disease. Such a flax has n developed, is now generally used, and the flaxseed industry is reasing; and under a tariff protection we would soon be producing this country, in the Northeastern States and the Northwestern ites, sufficient to supply our needs.

n 1910 our needs for linseed oil were approximately 40,000,000 lons; in 1920 our needs were approximately 75,000,000 gallons of and while our flax production has decreased approximately 39 cent in acreage, our demands for linseed oil have almost doubled.

Senator SIMMONS. What is that oil chiefly used for?

Senator LADD. For the manufacture of paint and the manufacture varnishes, and largely in the linoleum industry and various other s. But those are the great industries. I would urge before the iff may be decided upon that if it be decided to have the tariff the oil slightly higher compensatory tariff on the oil than on the t, in order that the flax we do have to import may come into the intry rather than the oil.

Senator SIMMONS. Where do these importations come from?

Senator LADD. Largely at the present time from Argentina.

Senator SIMMONS. The House bill provides for 2½ cents a pound the oil and 7.6 pounds per gallon?

Senator LADD. Approximately; that is, 18¾ cents, and that corponds to a duty of 25 cents per bushel on the flaxseed. So that figures are correct in your new proportion for the ratio?

Senator SIMMONS. The House ratio is correct?

Senator LADD. The House ratio is correct; yes, sir.

Senator SIMMONS. But you think you require that difference; I an, the House rates maintain that ratio?

Senator LADD. It should be 2½ cents.

Senator SIMMONS. The 25 cents——

Senator LADD. If the 25 cents should be retained.

Senator SIMMONS. And you want 3½ cents and 40?

Senator LADD. Yes, sir. I might say I have had the flaxseed shers go over these figures and confirm them for me, in order to ke sure I had not made any mistake; and their figures are identical h mine in the matter of ratio.

Senator MCCUMBER. Before you leave that subject, Senator, I l just phoned down to the Agricultural Department to know

their estimate for 1921 on flax, and their estimate is 8,112,0-bushels production in this country.

Senator LADD. In paragraph 50, I think there should be a tar upon two additional oils: Chinawood oil and perilla oil are now larg coming into the country, and I would suggest 2½ cents a pound them.

Senator McCUMBER. I desire to say to you, Senator, that wi nesses, I think, representing the varnish industry, have insisted be fore the committee that this Chinawood oil is not in any sense competitor of the flaxseed oil.

Senator McLEAN. And can not be produced in this country.

Senator LADD. It is not produced in this country, but I can n agree that it is not in any sense a competitor. It does take the pla in varnishes, and perilla oil takes the place in paints.

Senator SMOOT. But neither one of them is produced in th country?

Senator LADD. Neither one is produced in this country. B other oils can be and are produced, and I am not certain—I have n been able to find that soya-bean oil has any duty on it, and soya-be oil and soya beans, though soya beans are perhaps under the te "beans"?

Senator SIMMONS. Oh, yes; soya beans have a duty.

Senator SMOOT. They have a duty of 2 cents a pound.

(Senator Ladd thereupon submitted the following statement:)

THE TARIFF AND THE FLAX INDUSTRY.

Prior to 1910 the United States was an exporter of flaxseed products and v little flaxseed or linseed oil was imported into the United States. During t period we had an import duty of 25 to 30 cents per bushel on flax and 20 to 3 ce per gallon on linseed oil. For eight years previous to 1910 this country aver 2,750,000 acres devoted to flax products. Then began the reduction in tariff r especially on the linseed oil, and for the seven years—1914 to 1920—our average a was 1,684,000 acres. Here we have a decrease in acreage of 1,066,000 acres, or per cent, while the normal demand for linseed oil increased from about 40,00 gallons to not less than 75,000,000 gallons, or an increase of 75 per cent, while the a age acreage decrease, as already indicated, was 38.8 per cent. The tariff during t period was: Flaxseed, 20 cents per bushel; linseed oil, 10 cents per gallon—an result disastrous to a great industry.

They now propose a tariff of 25 cents per bushel on fix and 2½ cents per pound linseed oil. To encourage American flax production we should have a rate of not than 40 cents per bushel on flaxseed and 3½ cents per pound on linseed oil. S we attempt to encourage the production of flax for oil in this country or sha depend upon an uncertain foreign supply from Argentina, Canada, and Russ so destroy the flax industry of America? I question whether the proposed tar encourage the farmer of the Northwest to materially increase the acreage so as to pr duce the necessary yield of flaxseed, while in my judgment a tariff of 40 cents p bushel will bring the desired result and this without materially affecting the co oil to the ultimate consumer.

SHOULD PRODUCE OUR FLAX.

This country can and should produce the flax necessary to supply the needs of United States and to enable our manufacturers to ship abroad paints and varni made from the products produced in this country. This can not be done by a niggardly policy of half-hearted protection, and 50 cents per bushel at this t would afford no greater degree of protection than would the 30 cents per bushel in

In this country the Northeastern States and especially the Northwestern State-
re particularly well located to become large producers of flax as a staple crop in its ystem of crop rotation. Because of climatic conditions the farmers of the Northwests rn States do not produce the variety of farm products as do many other sections of ie country.

This past spring linseed oil was being imported so as to sell at 10 to 20 cents per allon under the cost of production for the domestic oil, and each year our domestic roduction has been lessened because of lack of adequate protection.

TARIFF ON FLAXSEED.

Note the degree of protection afforded in 1890 as compared with 1920:

Year.	Tariff on flax, per bushel.	Tariff on oil, per gallon.
	Cents.	*Cents.*
90	30	32
20	20	10

It is easy to see where the trouble lies and the reason for the decline in flax produc- on, which can only be revived by a fair treatment to encourage the farmers to again roduce flax and so place our country independent of foreign countries and insure the ontinued operation of the flaxseed-crushing industry of this country; otherwise we estroy this great industry with its millions of invested capital and become an im- orter of linseed oil from other countries, and thus miss the benefits that would come lso from the linseed meal, which is one of the most valuable feeds for the dairy industry.

According to data believed to be substantially correct, on May 14, 1921, the wages aid in the United States as compared with foreign countries in the flax-crushing idustry was per hour as follows:

Country.	Pressmen and molders.	Unskilled labor.	Dock labor at entry ports.
	Cents.	*Cents.*	*Cents.*
ngland	31.280	29.795	41.458
lland	24.8	22.8	34.4
ermany	9	7	....
nited States	50	40	80

Other expenses are proportionally higher in this country, so I think we may safely ly that it costs the American manufacturer not less than 25 cents per bushel more ian it does abroad on the average which in terms of linseed oil would mean 10 cents er gallon expense to the linseed crushers of this country over that of the foreign ountries named.

Another feature that should not be overlooked is the fact that in making up rations nd especially for dairy purposes, linseed cake or oil meal is recognized as one of the ost valuable of feeds, and if flax is grown in this country the feed becomes available r use in the dairy industry and stock production, and this fact should not be over- oked.

FLAX IMPORTATIONS.

From such data as I have been able to gather I find that for the year 1920 there was nported 24,641,190 bushels of flaxseed and 4,693,360 gallons of linseed oil. The uty on these products was 20 cents per bushel on flaxseed and 10 cents per gallon n linseed oil, meaning a duty of $5,397,574.

In addition to the above, there was imported into this country duty free the follow- ig: Soya bean oil, 14,961,833 gallons; china wood oil, 9,061,620 gallons; perilla oil) months), 879,413 gallons. Had there been a duty of 20 cents per gallon on this il it would have amounted to $4,980,573.20 and would have materially protected he flaxseed industry of this country, against which these products are now competitors.

In addition to the above oils, there are as competitors in some respects of linseed oil importation into this country in 1920 as follows:

	Pounds.
Cottonseed oil	9,457,924
Coconut oil	215,238,51[illegible]
Olive oil (inedible)	496,11[illegible]
Olive oil (edible)	30,591,0[illegible]
Palm oil	41,948,2[illegible]
Palm kernel oil	1,693,7[illegible]
Peanut oil	95,124,[illegible]
Rapeseed oil	12,912,6[illegible]

WHY FLAX PRODUCTION DECLINED.

The policy of the Government in reducing the duty on flaxseed and to a greater extent on linseed oil has resulted in making it possible for foreign manufacturers to export oil to this country at lower prices than the farmers and linseed-oil manufacturers in the United States could produce it. Foreign competition in oil has, therefore, not only been highly disastrous from the standpoint of the producer of the oil, but from the standpoint of the grower of the seed too.

Under the recent tariff policy the production of flaxseed in the United States has been very materially reduced, and if the policy of the past few years is continued the United States farmer will be compelled to sell his seed in foreign markets in competition with that from Argentina, if any is produced, or more probably the farmer will be forced to discontinue the growing of the flaxseed and a great industry now rapidly on the decline will be forced from the country and we shall not only lose the advantage of flax as a crop but likewise the great value of the linseed cake as a feed for the dairy and stock industries.

On the other hand, by a fair and liberal policy toward the flax industry there may be built up a great agricultural industry in the Northwest and the further development of oil production and a marked development of the paint and varnish industry; otherwise these great industries may likewise be forced to other countries where cheap labor enables them to produce their products cheaper than they can be produced in this country and thus they will be able to undersell our own manufacturers.

It ought not to be necessary to argue that it is for the best interests of this country to maintain the linseed-oil industry, which I am informed now amounts to nearly $100,000,000 annually, as this product is essential to the life of so many other industries that affect the entire industrial life of this Nation, to say nothing of the great flax industry of the farmers.

Shall the flax industry of the farmer, the linseed-oil industry of the Nation be preserved or shall we place this country wholly dependent upon foreign manufacturers for its supply of linseed oil, if not for the finished products dependent upon the oil industry?

In my opinion, Congress should place a duty of 40 cents per bushel upon flaxseed and a proper compensatory duty of 3½ cents per pound on linseed oil so as to assure the protection and development of the same. At present the American farmer can not produce enough flaxseed to furnish the demands of the country for linseed oil, but with proper protection this can be done inside of five years. To the extent, therefore, that the American farmer is not able to produce sufficient flaxseed to supply the United States' consuming requirements for flaxseed products, we should so adjust the duty as to encourage the importation of flaxseed from Canada and Argentina rather than of the linseed oil and thus we will encourage home production and manufacture and adequately protect our crushers in keeping this industry alive.

I attach hereto a further statement giving much additional data with regard to flaxseed production in this country, the importation and exportation, both of the seed and the linseed oil, which I believe will be found of value in the consideration of this important question, beginning with the year 1900.

1904	22,950	336,419	1920	4,550,391	[illegible]

[1] Year ending June 30.

It is interesting to know that the price per bushel for flaxseed was as low as [illegible] cents in 1903 and rose to $4.389 in 1919, but in 1920 it was back again to approximat[illegible] the price for 1915.

Several factors have worked to decrease the flax production in the United Stat[illegible] The most important, however, in my judgment, is the tariff provisions and especia[illegible] that affecting the linseed oil.

Another important factor was the fact that flax could not generally be grown [illegible] the same land for more than one or two crops without a complete failure. For a [illegible] time the cause for this was unknown but in recent years it has been discovered th[illegible] it was due to a disease that is brought into the soil with the growing of flax and kn[illegible] as "flax-wilt" which tends to destroy the crop in its early stages of growth. Dur[illegible] recent years there have been developed strains of flaxseed which are immune to [illegible] disease and can, therefore, be grown continuously on the same land without be[illegible] attacked by the so-called "flax-wilt."

The acreage of flax has declined steadily during recent years with a slight increa[illegible] in acreage during the period of 1916 and 1918, when there was stimulation becaus[illegible] need for war activity and increased prices. There has been an almost continu[illegible] increase of seed imported beginning with 1907 to 1916. In 1920 the importation w[illegible] the greatest in the history of the country.

On the other hand there has been an increased demand for consumption of [illegible] seed in this country and especially for linseed oil which has in recent years increa[illegible] from approximately 40,000,000 gallons per year to about 75,000,000 gallons.

Our exports have declined in flax products while the imports have largely increas[illegible] As a matter of comparison I am presenting in Table 4 a statement to show the a[illegible] age value of production per acre in the United States on December 1 for the ye[illegible] from 1910 to 1920 for both flaxseed and wheat.

TABLE 4.—*Value of production per acre in United States, December 1.*

Year.	Flaxseed.	Wheat.	Year.	Flaxseed.	Wheat.
1910	$12.048	$12.273	1916	$22.914	[illegible]

1912	11.240	12.084	1918	23.867	[illegible]
1913	9.352	12.144	1919	22.261	[illegible]
1914	10.584	16.367	1920	10.949	[illegible]
1915	17.574	15.623			

Inasmuch as North Dakota has been in years past the largest producer of flax in ıe United States, I present herewith Table 5 showing the acreage for the years eginning with 1902, the first complete available data, the yield per acre, the total roduction for the State, average price per bushel, and the total value of flaxseed r the year.

TABLE 5.

Year.	Acreage.	Yield per acre.	Production.	Price per acre.	Value.
			Bushels.		
02	2,160,000	7.2	[illegible]00	$1.06	$16,018,560
03	1,814,400	7.3	[illegible]	.81	10,728,547
04	1,233,792	10.6	[illegible]	.99	12,947,413
05	1,357,171	11.6	[illegible]	.84	13,224,275
06	1,465,745	9.9	[illegible]	1.02	14,801,094
07	1,700,000	8.0	[illegible]00	.96	13,058,000
08	1,530,000	[illegible]	[illegible]00	1.19	16,386,000
09	1,068,000	9.6	[illegible]00	1.57	16,096,000
10	1,117,000	3.6	[illegible]00	2.35	9,449,000
11	1,200,000	7.6	[illegible]00	1.84	16,781,000
12	1,246,000	9.7	[illegible]00	1.14	13,778,000
13	1,000,000	7.2	[illegible]00	1.21	8,712,000
14	840,000	8.3	[illegible]00	1.28	8,924,000
15	660,000	9.9	[illegible]00	1.78	11,631,000
16	790,000	10.3	[illegible]00	2.52	20,505,000
17	965,000	3.9	[illegible]00	3.00	11,292,000
18	800,000	7.8	[illegible]00	3.45	21,528,000
19	700,000	4.6	[illegible]00	4.41	14,200,000
20	735,000	5.3	[illegible]00	1.78	6,935,000

In this table it will be noted that in 1902 the acreage devoted to flax in North Dakota as 2,160,000, while in 1920 it had fallen to 735,000 acres and was less in some preceding ears.

BRIEF OF THE BUREAU OF RAW MATERIALS FOR AMERICAN VEGETABLE OILS AND FATS INDUSTRIES, REPRESENTING THE PAINT AND VARNISH MANUFACTURERS.

We desire to enter our protest against the inequality existing in this bill between ıe rate of duty imposed on flaxseed and the duty imposed on linseed oil. And we rotest against any rates of duties on flaxseed that will result in a duty of more than 2 cents per gallon on linseed oil. A duty on flaxseed resulting in any higher rate ıan 12 cents per gallon on linseed oil will impose too great a tax on linseed oil, will estrict the consumption of paints and varnishes and impose upon the consumer igher prices for paints and varnishes than could be justified by a reasonable appliation of the theory of protection.

We desire to submit herein out views concerning the rate of duty imposed on flaxeed in H. R. 7456, paragraph 760, and our views concerning an amendment that ould be made in section 316 of this same bill, which section 316 as it now stands rectly affects and reduces the rate of duty that would apparently be collected on axseed under the rate as provided in paragraph 760, and we further desire to set rth our views as to the proper method of establishing a compensatory rate of duty linseed oil which is the principal product of flaxseed and which is dutiable at 2½ nts per pound under paragraph 50 of this act.

DUTY ON FLAXSEED, ACT OF 1913.

The rate of duty on flaxseed under the act of 1913 was 20 cents per bushel, this eing the actual rate collected as the drawback provision in the act of 1913, paraaph O, section 4, contained the following provision:

"*Provided*, That where a principal product and a by-product result from the anipulation of imported material and only the by-product is exported, the proporon of the drawback distributed to such by-product shall not exceed the duty assesble under this act on a similar by-product of foreign origin if imported into the nited States, where no duty is assessable upon the importation of a corresponding y-product, no drawback shall be payable on such by-product produced from the aported material."

DUTY ON FLAXSEED, H. R. 7456.

The rate of duty on flaxseed in this bill, paragraph 760, is stated at 25 cents per bushel, but the actual rate collected will be only 18¼ cents per bushel, as section 316, special provisions of this act, contains the following provision:

"*Provided*, That where two or more products result from the manipulation of imported material, the drawback shall be distributed to the several products in accordance with their relative values at the time of separation."

DRAWBACK PROVISION IN H. R. 7456 REDUCES THE RATE OF DUTY ON FLAXSEED.

The principal product of flaxseed in the United States is linseed oil and the by-product is linseed cake.

As will be hereinafter plainly shown the problem of establishing a protective tariff for the American flax grower is solely one of protecting the oil content of American-grown flaxseed against the competing oil content of foreign-grown flaxseed, and hence to establish such protection in a clear and definite manner no system of assessing duties on flaxseed or other oleaginous seeds or materials should be adopted whereby the importer of foreign flaxseed or oil-bearing seeds or materials is allowed and paid any drawback upon the exportation of any of the by-products, as such by-products are oil cake in one form or other on which no duty is assessable, and consequently the rate of duty imposed on such materials is actually reduced below the stated rate by the refunding of a portion of the duty paid when the by-product exported is a commodity which comes in free of duty if any were to be imported.

OIL CAKE.

The United States produces a surplus of oil cake, and oil cake was duty free under the act of 1913, and is duty free in this bill, H. R. 7456.

The United States exports large quantities of its cottonseed oil cake, and considerable of the linseed cake resulting from the crushing of domestic flaxseed is also exported, and therefore it is evident that foreign flaxseed is imported solely for its oil content.

LINSEED OIL.

The problem of affording protection to the American flaxseed grower is therefore one of protecting the linseed-oil content of each bushel of flaxseed against the linseed-oil content of a bushel of foreign-grown flaxseed, which oil content has been separated from the foreign flaxseed by a foreign oil crusher who may export the oil content separately to the United States.

AMBIGUITY AND CONFUSION RESULTING FROM DRAWBACK.

That the element to be protected is the linseed-oil content is plain to be seen. The conversion of the protection to be granted on this element, linseed oil, into a rate of so much per bushel is merely incidental and for the convenience of expressing the rate upon the material (flaxseed) in which the oil is contained.

PROPER PROCEDURE FOR ESTABLISHING RATE OF PROTECTION.

The proper procedure for establishing the rate of protection on flaxseed is to consider the commodity in terms of linseed oil as this problem of protection is confined entirely to the oil content as there is no tariff problem concerning the by-product or linseed cake.

A bushel of flaxseed, of 56 pounds, as provided in paragraph 760 of H. R. 7456, yields in actual crushing practice 19 pounds of oil and 37 pounds of cake, hence the problem is one of protecting this 19 pounds of oil against 19 pounds of oil unseparated in a bushel of imported flaxseed or against 19 pounds of linseed oil that has been separated by a foreign crusher.

As linseed oil in commerce is dealt in in units of gallons of 7½ pounds each, it will be seen that 2½ gallons of oil are contained in a bushel of flaxseed; that is, the quantity a bushel of flaxseed will yield in crushing as established by practice in the crushing industry.

RATE OF PROTECTION FOR AMERICAN FLAXSEED GROWER.

If it is desired to protect the American flax grower to the extent of 8 cents per gallon of oil content the rate to be established on bushels of flaxseed would be 2½ times 8 cents or 20 cents per bushel.

If it is desired to protect the American flax grower with a rate of 10 cents per gallon of oil content, the rate to be established on bushels of flaxseed would be two and one-half times 10 cents, or 25 cents per bushel.

To make the rates effective when so established by this method of calculation, which is the only logical method when it is agreed that the element on which protection is to be calculated is linseed oil and nothing else, the cake having been placed duty free, it is only logical and sound that the rates so established should not be rendered ineffective by the application of any drawback system providing for the payment of a drawback on linseed cake, which is equal to the refunding of a duty levied upon the linseed oil content of imported flaxseed when only the cake is exported and which cake is not the object of any tariff consideration.

We therefore urge that the rate of duty to be imposed on flaxseed be calculated in the above-described manner and in order to make the rate of duty so decided upon fully effective we recommend that if Title III, special provisions of H. R. 7456, is going to be retained in the bill that section 316 thereof be amended by adding to this section as the last paragraph the following:

"*Provided further*, That the provisions of this section shall not apply to the products of oil-bearing seeds and materials enumerated in paragraph 760 of this act, and where a principal product and a by-product result from the manipulation of imported material enumerated in paragraph 760 of this act, and only the by-product is exported, the proportion of the drawback distributed to such by-products shall not exceed the duty assessable under this act on a similar by-product of foreign origin if imported into the United States. Where no duty is assessable upon the importation of a corresponding by-product, no drawback shall be payable on such by-product produced from the imported material; if, however, the principal product is exported, then on the exportation thereof there shall be refunded as drawback the whole of the duty paid on the imported material used in the production of both the principal product and the by-product, less 1 per cent as hereinbefore mentioned."

This provision of amendment will make the rates of duty determined upon under paragraph 760 definite in application and clear of comprehension. This amendment will also provide the American flaxseed crusher with a drawback on any linseed oil he may export, equal to the amount of the duty he paid on the same quantity of linseed oil as contained in the flaxseed which he first imported and from which he separated the oil, less the 1 per cent retained by the Treasury Department.

As the bill now stands the American flaxseed grower would be left with the impression that the rate specified in paragraph 760 was the rate at which he was actually protected, whereas this is not the fact. As the bill now stands any importer bringing in flaxseed for crushing purposes only pays 18½ cents per bushel, as he is credited with a drawback calculated on that part of the flaxseed in connection with which there is no tariff consideration, as that part of the flaxseed, linseed cake, is on the free list and practically all foreign flaxseed is so imported for crushing purposes and the linseed cake is so all exported.

COMPENSATORY PROTECTION FOR AMERICAN LINSEED CRUSHER.

The compensatory rate for the American linseed crusher must necessarily be a rate applied to linseed oil under paragraph 50 of H. R. 7456, exactly the same as the per gallon oil content rate established for the protection of the American flax grower. Under paragraph 50 the rate on linseed oil should be changed and expressed in gallons. The Committee on Ways and Means were advised to impose rates on vegetable oils in units of pounds, and properly so, in the case of coconut oil, soya bean, cottonseed oil, and a few other vegetable oils, but linseed oil is one exception to which the above recommendations should not have been applied as the American consumers of this oil have dealt in it from time immemorial on the basis of gallons just as the consumers of those other oils have been used to dealing in units of pounds. Therefore if the rate of protection decided upon for the American flaxseed grower is 8 cents per gallon on the oil content of flaxseed or 20 cents per bushel, the compensatory rate of protection for the American linseed crusher would be 8 cents per gallon on linseed oil. If 10 cents per gallon or 25 cents per bushel for the American flax grower, the compensatory duty on linseed oil should be 10 cents per gallon.

PROTECTION FOR THE AMERICAN LINSEED CRUSHER TO EQUALIZE COST OF CRUSHING IN THE UNITED STATES AND FOREIGN COUNTRIES.

We submit herewith an analysis of two briefs submitted on the above subject by the American linseed crushers, one of which was submitted to your honorable committee and one of which was submitted to the Committee on Ways and Means:

[1. Brief to Committee on Ways and Means by Spencer Kellogg & Sons, Buffalo, N. Y.]

Cost of crushing at home and abroad.—Stated not serious other things being con... but is solely a matter of ocean transportation. Did not claim labor cost disadva...

Transportation costs.—Author of above brief stated would present ocean f... disadvantages later. As he subscribed to other brief we place under this ite... same figure appearing in other brief, 3.28 cents.

Suggested protection for crushing industry.—Suggested return to Payne-Al... measure under which had favorable differential of difference between 7.4 cents ... on flaxseed and 15.0 cents on linseed oil or 7.6 cents crushing protection or over ... amount required to cover only disadvantage claimed.

[2. Brief of W. O. Goodrich, Milwaukee, Wis., representing entire industry.]

Cost of crushing at home and abroad.—Total cost of crushing in United State... bushel, $0.50; foreign cost of crushing, $0.25; excess cost in United States, $0... 10 cents per gallon.

Transportation costs.—Transportation disadvantages, 3.28 cents; total, 13.28 ...

Suggested protection for crushing industry.—Author in testimony acknow... represented by first brief in which only disadvantage claimed was 3.28 cents ... portation costs but at later date here claims 10 cents labor cost disadvantage wh... other associated witnesses originally stated did not exist.

To establish the disadvantages under which the American linseed crusher opera... as compared with the conditions under which the foreign crusher operates is ... problem.

Referring to the above analysis of evidence presented, brief No. 1 was subm... by Spencer Kellogg & Sons, of Buffalo, N. Y., to the Ways and Means Comm... and appears in the records of the hearings of this committee on tariff revision in ... 6, page 4397. We quote the third paragraph therefrom.

"In 1913 the Underwood-Simmons measure was adopted, the rates of which ... made up in conference between the House and the Senate and the lowest sugg... rate for linseed oil was adopted, while the highest rate for linseed was adopted. T... action, as shown in the table above, left only a difference of 3 cents a bushel ... protection to United States manufacturers against not only foreign labor, wh... would not be such a serious matter, other things being taken into consideration, ... which is serious because the whole matter is one of ocean freight rates, and we ... under certain disadvantages in that respect, which we will attempt so show late...

At the top of page 4398 this witness or petitioner suggests that just and fair ... for linseed and linseed oil are 20 cents per gallon on oil and 25 cents on Flaxseed ... a drawback provision to reduce the actual duty on flaxseed to 18½ cents per bu... That this suggestion was not offered seriously is apparent from the last paragrap... this brief, in which a lower rate is approved of on linseed oil.

So far as this problem is concerned the vital points contained in this brief were ... following:

1. It shows plainly the operation of the Payne-Aldrich bill whereby the ... duty paid on flaxseed was 18½ cents, although the rate specified in the Payne-Ald... bill is 25 cents per bushel.

2. It establishes the witness' belief that no appreciable difference exists ... costs of crushing flaxseed in the United States as compared with the costs in ... countries.

3. It states the whole difference in costs or the American crushers' disadvanta... due entirely to disadvantages existing with regard to ocean freight rates which ... be shown later on.

4. The Payne-Aldrich Act—which with its duty of 25 cents on flaxseed, less dra... back, or 18½ cents per bushel actual, or 7.4 cents per gallon, and its rate of 15 cen... linseed oil, or a differential in favor of the American crusher of 7.6 cents per ga... afforded "reasonable" protection and would be satisfactory.

Now, coming to the second brief and our analysis of it, we wish to call atten... the verbal testimony of Mr. William O. Goodrich, of Milwaukee, Wis., represe... the William O. Goodrich Co., who appeared before your honorable committee ... 17, 1921:

"Mr. GOODRICH. I am chairman of the Linseed Crushers and Flaxseed Comm... which is a committee representing the entire linseed-oil producing industry in ... country."

And further on appears the following:

"The CHAIRMAN. You had a hearing before the House committee?

"Mr. GOODRICH. Yes, sir.

"The CHAIRMAN. Was it printed?

"Mr. GOODRICH. Yes, sir."

he only brief filed with the Ways and Means Committee is the brief of Spencer logg & Sons and there is no record of any other testimony on the subject. We refore presume that the brief of Spencer Kellogg & Sons (Inc.) is the brief or hear-acknowledged by Mr. Goodrich as having been presented in his interests to the mittee on Ways and Means. Therefore it appears to be quite well established t the brief presented by Spencer Kellogg & Sons (Inc.) before the Committee on ys and Means represented the entire industry, just as the brief presented by Mr. drich to your honorable committee on August 17, 1921, also represented the re linseed crushing industry.

e wish to establish clearly that both briefs apparently had the approval of the re industry at the time they were filed.

e call attention to the corresponding analysis of the second brief. The vital its developed in this brief appear to be the following:

The disadvantages under which the American industry operates is equal to ents per bushel, or 10 cents per gallon, whereas before the Ways and Means Com-tee the representative of this industry in that brief states that "The question of ign labor would not be a serious matter, other things being taken into considera-. but which is serious because the whole matter is one of ocean freight rates, and are under certain disadvantages in that respect."

n this brief the less serious matter of comparative labor costs is three times the ount of the most serious freight disadvantage previously dwelt upon. From no ous disadvantage on account of labor costs before the Committee on Ways Means the question of labor costs to be provided for by your honorable com-tee develops to be 25 cents per bushel, or 10 cents per gallon, which is two times total factory cost of crushing flaxseed, in our opinion. The cost here stated 0 cents per bushel is 20 per cent of the value of the products and by our esti-te is about four times the factory cost of the operation.

. The ocean freight disadvantages of which an explanation was promised in the vious brief are found explained here in this brief, the disadvantage in this respect ng claimed to be 3.28 cents per gallon.

The total disadvantage claimed as compared with foreign linseed crushers is 28 cents per gallon. In this brief it is stated that unless this industry is to be troyed the amount of this disadvantage must "absolutely" be provided.

. The protection for American crushers under this bill is equal to the difference ween 7.4 cents per gallon duty on flaxseed and 18¾ cents per gallon duty on oil, difference of 11.35 cents per gallon, or nearly 2 cents less than the industry claims its written brief that it must "absolutely" be provided with, and yet in the ver-testimony before the brief was left with your committee Mr. Goodrich, represent-the entire crushing industry, said, "We are entirely satisfied with the provision de for protecting our industry in the tariff bill now before you."

Iow can these witnesses be so well satisfied with a rate of protection granting them y 11.35 cents per gallon protection against foreign linseed oil when they say they st have not less than 13.28 cents in their printed brief.

by following the arguments of this industry back; the answer is perfectly clear. ile 13.28 cents per gallon is absolutely needed in the brief presented to your com-tee we find the industry through the oral expressions of its spokesman delighted h only 11.35 cents per gallon, and going back still further to the brief presented to Committee on Ways and Means we find that protection for the crushing operation nly 7.6 cents per gallon would have been very satisfactory to the industry, and we not believe the evidence submitted to your honorable committee is worthy of sideration, but believe the actual conditions are truthfully set forth by Spencer llogg & Sons, who represented the industry before the Ways and Means Committee. this brief it is stated.

1. Labor costs as compared with the labor costs of foreign crushers do not present a ous problem, other things being considered (we presume the other things con-red are the many natural advantages possessed by the crushers for supplying our ne market with oil).

2. The whole question of disadvantage is admitted to be one of equalizing trans-tation costs and the disadvantage is now stated to be 3.28 cents per gallon."

LABOR COSTS.

That the difference in labor costs could not be claimed to be serious as first admitted the crushers is readily confirmed. Any disadvantages of this kind could only in-ve factory labor as the foreign oil crusher if attempting to enter the American rkets and render a relative kind of service in distributing his products would be

would be unable to render the same kind of distribution service except at a m[illegible] greater cost than the American crusher, if able to do it at all.

The labor in linseed crushing as in the case of crushing other seeds is well know[illegible] be a small element. In our cottonseed oil industry the labor cost of crushing co[illegible] seed which yields only 15 per cent of oil is 5 per cent of the value of the product[illegible] duced. Linseed oil mills are more modern and better equipped than th[illegible] cottonseed oil mills and are provided with mechanical devices and conveyor[illegible] reduce the labor to a minimum. The United States Tariff Commission, in its su[illegible] of the linseed industry, on page 131 states: Establishments in operation, 25; wage ear[illegible] employed, 1,488; total wages paid, $1,127,000.

The labor employed was less than 60 workers in each establishment on the avera[illegible]

The production of linseed oil in the United States during the same year, 191[illegible] Flaxseed consumed, 23,000,000 bushels; linseed oil produced, 507,422,000 p[illegible] or 67,650,000 gallons.

The labor cost during that year, so far as the 1,488 wage earners on the pay [illegible] of the entire linseed-crushing industry were concerned, was therefore $1,12[illegible] the production of 67,650,000 gallons of linseed oil, or 1.7 cents per gallon, or [illegible] cents per bushel of flaxseed.

The average value of flaxseed that year (1914) was $1.52½ per bushel, and [illegible] $1,127,000 expended for wages was for the production of linseed cake as well a[illegible] oil, a proper percentage of labor cost is arrived at by comparing the wages paid [illegible] bushel and the average value per bushel of flaxseed; 4.25 divided by 152.50 e[illegible] 2.8 per cent.

The census of 1905 shows that the wage cost in the production of linseed oil wa[illegible] per cent of the total value of the products produced.

It appears probable that the wages paid to labor in this industry does not cons[illegible] the entire labor expense, as the labor cost of handling the imported flaxseed fro[illegible] coming steamers at the ports of entry and into the mill might largely be perfor[illegible] by stevedore companies or other agencies and the disbursements therefor migh[illegible] appear in the item of wages paid to wage earners.

On the other hand, undoubtedly part of the wages paid to wage earners is for [illegible] done after the crushing operation and is properly chargeable to shipping and [illegible] bution, which costs would have to be borne by any foreign linseed-oil mill attem[illegible] to sell linseed oil in the United States and would have to be borne by them [illegible] foreign cost of distribution.

However, if a liberal allowance were made to the American crusher for labor [illegible] not reported in his pay roll, and if for this purpose an amount equal to one-thir[illegible] the amount shown as wages were added to the costs carried as wages, then the [illegible] cost of crushing would only be 4 per cent of the cost of the flaxseed.

It is, of course, to be understood that other costs, such as administrativ[illegible] selling, are a part of the cost of the products when delivered to the consum[illegible] these costs have no place in the consideration of tariff making, as a foreign [illegible] crusher would have to pay even greater additional selling and distribution cos[illegible] the domestic crusher in order to secure the same results in the matter of [illegible] sales and effecting the distribution of foreign linseed oil. The foreign crushe[illegible] tempting sales distribution in the United States, would be likewise obliged [illegible] for the elements of this on the basis of American standards.

On this date, August 26, the market price of linseed oil at New York in [illegible] tank cars was 70 cents per gallon; the price of linseed cake f. a. s. New Yor[illegible] $42 per ton of 2,000 pounds. At these values the 19 pounds of oil in a bushel [illegible] seed and the 37 pounds of linseed cake were selling as follows: Linseed oil, 19 p[illegible] or 2½ gallons, at 70 cents, $1.75; linseed cake, 37 pounds, at 2.01 cents per [illegible] $0.743; total, $2.493.

Total value of these products from a bushel of flaxseed was in round figure[illegible] If the cost of crushing was 50 cents per bushel as suggested by Mr. Goodr[illegible] appeared before your committee the percentage would have been 20 per cent [illegible] amount would be absurd.

The statistics concerning this industry fully bear out the statement of [illegible] Kellogg & Sons in their brief to the effect that the difference in labor cost [illegible] and abroad are not serious, and in fact we do not believe the American indus[illegible] any disadvantage whatever.

TRANSPORTATION COSTS.

The disadvantage claimed of 3.28 cents per gallon on account of certain [illegible] tation costs is in our opinion too high for the reason that in arriving at this fig[illegible] representatives of this industry calculated the difference in the cost of tran[illegible] their linseed cake made from foreign flaxseed to Europe where it is all sold a[illegible]

ıst of transporting linseed oil produced in European oil mills to the United States exported to this country and arrived at a difference of 3.28 cents per gallon in favor the linseed oil shipped from the foreign mills. However, the costs of recoopering e barrels in which foreign oil would have to be shipped, leakage of oil on the voyage, :cess of marine insurance on oil above cake, and a number of other expenses not ıumerated which would occur in connection with the landing of foreign linseed oil barrels would cut this differential or disadvantage down by 1 cent per gallon in ır opinion and in all probability the disadvantage would not exceed 2 cents per ılon if accurately figured in detail. However, these slight errors can be ignored d, in accordance with the brief of Spencer Kellogg & Sons (Inc.), if this disadvantage 3.28 cents per gallon is accepted as representing the disadvantages of the American ısher through transportation costs, it is the only disadvantage that exists, and on e other hand the American crushers enjoy many advantages as explained in our ief relating to paragraph 50 of this bill.

COMPETITION FROM FOREIGN LINSEED OIL HAS BEEN NEGLIGIBLE.

We present herewith a table showing the production, imports, and exports of linseed for the calendar years 1914 to 1920 and the first half of 1921.

LINSEED OIL.

Year.	Production.	Consumption.	Imports.	Exports.	Price per gallon.
	Gallons.	*Gallons.*	*Gallons.*	*Gallons.*	
4.	507,422,000	498,210,000	4,350,000	1,995,000	$0.50
5.	418,260,000	409,130,000	663,000	10,045,000	.56

(6 months)	....	....	13,802,000	39,090	....

By taking our imports of linseed oil during any or all of these years and deducting exports, it will be found that our net imports are very small and less than 5 per t of our consumption.

During recent years American linseed crushers have absorbed considerable of the ıced oil which has been imported, therefore these imports from abroad, amounting otal to less than 5 per cent of our consumption, do not represent competition in strict sense of the word. As mentioned in our brief on linseed oil, paragraph 50, erican consumers of linseed oil, such as our paint and varnish manufacturers, will abandon the domestic crushed oil and go afield for their supplies unless the for-ı supplies can be obtained at fully 10 per cent less than the price at which the ıestic crusher is selling for, and even then the foreign oil so imported rarely is ɔped away from the Atlantic seaboard. Probably 50 per cent of the foreign lin-d oil imported has been purchased by our domestic crushers and has been taken › their storage tanks and plants at the Atlantic seaboard and reshipped to Ameri-paint and varnish manufacturers at probably the same prices as were being quoted these crushers for domestic oil, and thereby a large part of these shipments have n a source of profit to the American linseed crusher instead of being "competi-s," all of which conclusively demonstrates the American crushers' many advan-es through his distributing facilities, which, we believe, entirely apart from tariff tection, acts as a protection equal to 10 per cent ad valorem. The linseed crushers'

natural advantages in the distribution of linseed oil is such that he could sell a ... lot of foreign linseed oil at 10 per cent above its import duty-paid cost where the ... lot of oil if offered for sale on import terms at the import duty-paid price wo... be accepted by the same consuming purchaser as being a satisfactory purchase

OUR RECOMMENDATIONS.

We therefore recommend that as a margin of protection for the American ... crusher over and above the actual per gallon of oil content rate of duty impo... flaxseed that no further additional rate of protection be imposed on linseed ... excess of 4 cents per gallon.

If the amendment to section 316 (drawback) is adopted, as suggested herein... we would recommend the tariff on flaxseed and linseed oil be adjusted as follows

Flaxseed, 20 cents per bushel; linseed oil requires 8 cents per gallon compens... and 4 cents per gallon crushers' protection, total 12 cents per gallon.

On this basis the actual protection given the American flaxseed grower w... increased from the net rate of 18½ cents per bushel which would result from ... 7456 in its present form to 20 cents and the rate of 2½ cents per pound on linse... in paragraph 50, or 18¾ cents per gallon, would be reduced to 12 cents per gallon.

We would therefore sum up our recommendations as follows:

That section 316 be so amended that the rates of duty imposed on flaxseed and ... oil-bearing seeds and materials contained in paragraph 760 would be made pos... and definite in application and that the provision now in the bill for the pay... drawbacks on oil cake resulting from the crushing of dutiable oil-bearing se... materials be eliminated.

That the rate of duty on flaxseed in paragraph 50 be reduced from 25 to 20 cen... bushel.

That the rate of duty on linseed oil in paragraph 50 be reduced from 2½ cent... pound to 12 cents per gallon.

The 32 paint and varnish manufacturers of the United States, members of ... bureau, protest against the rates now written in H. R. 7456 on flaxseed and lin... oil as being illogically constructed and indefinite of application and as imposing a ... of duty on linseed oil 6¾ cents per gallon higher than is necessary to provid... and reasonable protection for the American linseed crusher.

GRASS SEEDS.

[Paragraph 761.]

STATEMENT OF WILLIAM G. SCARLETT, BALTIMORE, MD., REPRESENTING WHOLESALE GRASS SEED DEALERS' ASSOCIATION.

Mr. SCARLETT. I am president of the Wholesale Grass Seed Deale... Association, and a member of the firm of William G. Scarlett & C... of Baltimore.

Senator DILLINGHAM. What paragraph do you speak on?

Mr. SCARLETT. Seven hundred and sixty-one, sir. Gentlemen ... have a brief here which I will file with you. I can either read ... brief or speak from it, just as you prefer.

Senator SMOOT. File your brief, and if there are any points y... want to bring out bring them out just as succinctly as possible ... your own good.

Mr. SCARLETT. As advised, I am speaking as president of ... Wholesale Grass Seed Dealers' Association on paragraph 761. Th... tariff bill provides for certain duties on various seeds. They spe... of them as "grass seeds." I would like to call your attention to ... fact that many people in referring to grass seeds think of lawn gra... We are not interested in that; we are interested in the great fora... seeds, such as clover, alfalfa, alsike, crimson clover, timothy, ... vetch, all of which have been placed on the dutiable list. Th... seeds are indispensable to our farmers, and while the volume is ... great the production or the result is enormous.

These seeds are used for feeding cattle and for enriching the soil, nd not for ornamentation.

Senator SMOOT. You mean alfalfa is used for feeding cattle?

Mr. SCARLETT. Alfalfa hay, not the seed.

Senator SMOOT. We are talking about seeds now.

Mr. SCARLETT. Yes, sir; I was referring to the production of the eds. I may mention that the seeds themselves——

Senator SMOOT (interposing). Do you want these seeds on the free st?

Mr. SCARLETT. Yes, sir.

Senator SMOOT. The farmer raises alfalfa seeds and raises most of ese other seeds, and he does not want it there.

Mr. SCARLETT. I think he does, sir. The farmer in America does ot raise sufficient alfalfa to supply the demand of America, and eds are an incidental crop. If the hay product is selling in the arket at a higher price, which it frequently does, it does not pay the rmer to allow his stand to go to seed.

Senator SMOOT. You may know more than I do about alfalfa seed, it I have grown a great deal more of alfalfa than you have, and I ow something about it myself. Will you tell us why we should ve free seed?

Mr. SCARLETT. We should have free seed, sir, because this country es not raise a sufficient quantity of forage seeds to supply the mands of this country.

Senator SMOOT. That happens with a great many things in this ll, does it not?

Mr. SCARLETT. I only know about paragraph 761, sir; I do not ow about the other parts of the bill. And it is a fact that when eds advance in price the demand decreases and does not increase, d it is also a fact that high seeds mean that poor quality is used stead of high quality.

The total annual production of grass seeds is 400,000,000 pounds, lued at between 40 and 50 million dollars, but the annual hay crop me (1911 to 1920 average) had a farm value of over a billion and a lf dollars, and that does not take into consideration the crops rned under for green manuring and soil improving.

During the war the Government felt——

Senator McCUMBER (interposing). Is that correct that alfalfa y amounts to more than a billion dollars?

Mr. SCARLETT. Not alfalfa hay, but all hay. I am very glad you ked that question, because so many do not associate these indis- nsable forage seeds as grass seeds.

During the war our Agricultural Department was rather alarmed account of the supply apparently not being great enough for the mand, and they sent representatives abroad to assure us that re would be a sufficient supply for the demand here.

Grass seeds have always been on the free list. They have never n on the dutiable list—I guess I should not say "grass seeds"; hould say forage seeds. I do not like "grass seeds" because it is leading—ever since there has been such a thing as a tariff.

I have references here in the brief; if you would like I can read them file them with you, whichever you prefer.

Senator DILLINGHAM. We have all that material.

Senator McCUMBER. Make it a part of your remarks by filing your brief.

Mr. SCARLETT. All right. I do not want to take up your time with that, sir.

Taking the imports from 1910 to 1920 and using the duties that are proposed to be levied according to this Fordney bill, the total revenue to the Government would be less than three-quarters of a million dollars; which is very small compared with the enormous value of these seeds, and with the duty the importations in all probability would be decreased so they would not even get that amount.

If these duties are placed on seeds the cost per sowing-acre will be considerable. I have them here with other paragraphs, but I will just give a few of them:

Cost per sowing-acre for alsike the duty would be 45 cents per acre.

On the cost per sowing acre of crimson clover the duty would be [illegible] cents.

On the cost per sowing acre for hairy vetch the duty would be $1.2[illegible]

On the cost per sowing acre for spring vetch the duty would be [illegible] cents per acre.

On the cost per sowing acre for rye grass, the duty would be $1 an acre.

On the cost per sowing acre for orchard grass the duty would be [illegible] cents per acre.

The American farmer must pay an average of 17.9 per cent more for these grass seeds, or at the rate of 59.1 cents more per sowing acre under this new tariff.

Senator McLEAN. That is, these rates would average an ad valorem duty of 17½ per cent?

Mr. SCARLETT. These are specific duties, and take so much per pound that would be the average increase; yes, sir.

Senator McLEAN. The ad valorem equivalent would be 17½ per cent?

Mr. SCARLETT. Seventeen and nine-tenths cents; that would be the average. The increase on above grasses 17.9 per cent, and the average increase for sowing acre is 59 cents.

I called attention to the fact that forage seeds in this country are incidental crops. The farmer frequently finds it to his advantage to cut his hay and market his hay or to turn it under for green manuring.

Senator McLEAN. What percentage of the consumption is imported?

Mr. SCARLETT. The American farmer demands 38 per cent more clover seed than is produced in the United States.

Senator SMOOT. That is clover seed?

Mr. SCARLETT. That is clover of all kinds. By the way, clover takes up the largest quantity of our importations by far.

Senator McLEAN. Is there any difference in the quality?

Mr. SCARLETT. Quite a difference, sir, which is very nicely protected by Federal seed law, which we have had in operation for [illegible] years. That seed law provides that seeds must be of a certain percentage of purity and a certain percentage of germination before they are admitted to this country. And at the present time there are [illegible] 100 tons of Chilean red clover lying on the docks at New York w[illegible]

ın not come into this country because it is infested with dodder. We ave splendid protection in that respect.

Senator McLEAN. It is very important, is it not?

Mr. SCARLETT. It is, sir.

Senator McLEAN. The American quality is as good, if not better, ıan the imported article?

Mr. SCARLETT. The American quality varies very much; as it ›mes from the farm it is frequently in very bad shape. There are ›me sections where the quality is very poor in America. We have ›me sections in the West—and maybe these gentlemen will recall— here alfalfa contains considerable dodder, so much so that that seed ın not be used in other sections of the United States because the ;ate laws will not permit it.

Senator WATSON. In other words, there is no demand for this ıriff in order to obtain a pure quality of seed in the United States.

Mr. SCARLETT. Absolutely none, sir.

Senator SMOOT. I did not understand the question.

Senator WATSON. I say, there is no demand for the tariff in order › protect the quality of the seed in the United States.

Senator SMOOT. The tariff will not protect the quality at all. We ıse just as good seed in the United States as anywhere in the world.

Senator WATSON. Precisely, but there is a law now that controls ıat proposition that a tariff is not necessary to improve it.

Senator SMOOT. Not at all.

Senator WATSON. What proportion of your alfalfa that is used in ıe United States do we produce in the United States?

Mr. SCARLETT. There are no statistics to show what the proportion . But it varies; for instance, you take Kansas—this year the crop as very poor, so much so that it looked like there was not going to be ıy alfalfa in Kansas at all. Naturally when there is a shortage of ·oduction in this country the imports increase.

Senator McLEAN. What is the difference in price?

Mr. SCARLETT. The difference in price? You mean between the ıported and the American seed?

Senator McLEAN. And the domestic product.

Mr. SCARLETT. That is a rather difficult question to answer; that , there is no regular difference in price. There are times when the ıported seed may be higher than the American seed. It depends on .e production on the other side.

Senator SMOOT. There are certain lands in the West that grow falfa seed, and the very best seed that there is in the world, that ɔuld not grow a crop of hay to speak of at all.

Senator McLEAN. It is an article that has been very high.

Senator SMOOT. It is not high at all.

Senator McLEAN. It is very high in the East.

Senator SMOOT. You are not using so much of it?

Senator McLEAN. It is very expensive.

Senator SMOOT. What do you call "expensive?"

Senator McLEAN. I do not recall just the price that has been paid, ıt I know it is the most expensive seed we buy.

Senator SMOOT. Alfalfa seed never sells, with the exception of a w years during the war, for more wholesale than 10 cents a pound , home.

Senator McLEAN. I pay four times that ·

Senator SMOOT. We can not tell anything about what the retailers will do to the American people.

Senator McLEAN. I was asking the question, because I like to show up in these hearings as we go along the unconscionable spread between the wholesale and retail prices.

Senator SMOOT. The alfalfa grower would be pleased if he could be guaranteed 10 cents a pound for his seed year in and year out.

Senator McLEAN. Timothy has been very high and all seeds have been very high.

Mr. SCARLETT. May I ask where you are from?

Senator SMOOT. I am from the State of Utah.

Mr. SCARLETT. You have a great deal of trouble in Utah with dodder in your alfalfa, and we would like very much to see it eradicated from your alfalfa, as well as from your red clover. We would like to work with you to get that dodder out. You grow nice alfalfa, but the seed is not fit to use.

Senator SMOOT. We have no trouble having other people use it.

Mr. SCARLETT. Your demand is restricted on account of the noxious weed in it.

Senator SMOOT. There is a weed in it.

Mr. SCARLETT. We would like to help you get it out; we are with you on that.

Senator SMOOT. The seed being on the free list will not help get it out.

Mr. SCARLETT. No; but it gives us that much more supply. If we were to depend on Utah for a supply, we could not use it, because the State laws will not permit us to use seed with dodder in it, and if there is a failure here we have no place to turn for seeds. We cannot turn to Utah, because it is unfit for use.

Senator SMOOT. There is a little section of that, but the great bulk of the Utah seed is as good as any seed in the world.

Mr. SCARLETT. I am glad to hear of it; we are very glad to know it.

Senator SMOOT. In fact, I think that is where it was started in this country. The first alfalfa sown was sown in Utah.

Senator McCUMBER. Is there any method of eliminating the noxious seed from the alfalfa seed?

Mr. SCARLETT. It can not be done, unfortunately, sir.

Senator McLEAN. How about the thistle in the clover seed? We have to be very careful.

Mr. SCARLETT. You understand, seed of that character will not be allowed to come into this country. Our import act protects us in that regard. If there is Canadian thistle in our clover seed, we can not bring it to this country. If there is dodder in our alfalfa seed, the Agricultural Department will not allow it to come in, and we can not touch that seed until the Agricultural Department has passed on it.

Senator McLEAN. Is there any Federal regulation that protects the farmer against these noxious seeds in domestic-grown products?

Mr. SCARLETT. There is no Federal regulation, unfortunately, but there are State regulations.

Senator SMOOT. All of the State laws protect it.

Mr. SCARLETT. Nearly all the States have laws now.

Senator McLEAN. We get Canada-thistle seed in clover seed almost always.

Mr. SCARLETT. Watch your tags. If there is thistle, it should be n your tags, and it should not be used. Nearly all States provide hat tags on your shipment should have a statement of the percent- ge of purity and germination; and I would suggest that you watch our tags.

In that connection, I understand that the chairman of the sub- ommittee of the Ways and Means Committee of the House was not ware of this import act, and on account of his not being familiar ith that act he favored a duty on seeds. I think he will tell you at, sir; he has told our members that.

Senator SMOOT. Senator Sterling writes to me this morning and closes a number of letters from farmers in his own State (South akota) asking that the alfalfa duty be increased 2 cents, from 2 nts to 10 cents per pound.

Mr. SCARLETT. That is quite possible. The farmers who produce ed in this country comprise about 5 per cent. Is it fair to tax the her 95 per cent (on over 6,000,000 of farms) to protect that 5 per nt?

Senator SMOOT. There are not 6,000,000 farms in the United States at grow alfalfa.

Mr. SCARLETT. No; but there are probably 6,000,000 farms that ill use alfalfa to a greater or less extent, though not growing it for ed.

Senator SMOOT. Not even growing it for hay?

Mr. SCARLETT. There is not even half or a quarter. I do not now the statistics, but there are over 6,000,000 farms, and the ajority of the farms will have a little patch of alfalfa, and we are l interested in seeing that they grow alfalfa. The more they grow, e better.

Senator SMOOT. For the seed trade?

Mr. SCARLETT. No, sir; the seed part is not interested. I am very ad you mentioned that. I am not here speaking especially for the ed men. It does not make any difference to us at all; absolutely ne. The farmer will pay this duty. If the duty is put on seed turally, if we have got to charge it on our price, and the farmer's terest is our interest.

Senator SMOOT. And the farmer who raises it is not your interest?

Mr. SCARLETT. Yes, sir; the farmer who raises it is our interest, d we would be very glad to go out to your State to help him raise re seed.

Senator SMOOT. They know how to raise seed out there just about well as the seed men here in the East.

Mr. SCARLETT. The seed man does not know much about it. But ase get that in your mind, we are not here because it especially ects our business. It is only as far as it affects the farmer. What ects the farmer affects us, and we expect you will probably hear m the farmers later on in this connection.

If the farmers come along and say all of them want the duty we l go along with them; we are perfectly willing to go along with the mers. The duty does not amount to 10 cents as far as we are ncerned.

I understand that neither the Treasury Department nor the Agri- tural Department have favored a duty. The Treasury Department

does not think it is necessary and the Agricultural Department does not think it is necessary.

Senator SMOOT. I do not think the Treasury Department has expressed any opinion on it whatever.

Mr. SCARLETT. No, because they have not been asked.

Senator SMOOT. Then, how do you know?

Mr. SCARLETT. They have not been asked officially.

Senator SMOOT. It would not make any difference to the committee if they had; the committee would decide the question.

Mr. SCARLETT. It probably would not make any difference to the committee. But the Treasury Department, I believe, have statistics and they are interested in revenue.

Senator SMOOT. They would not get any revenue by putting it on the free list.

Mr. SCARLETT. They would not get much duty by putting it on the duty list, either.

Senator SMOOT. They would not get any less on the dutiable list.

Mr. SCARLETT. But they would injure the seeding availability in the United States; the injury would be greater than the revenue derived from this.

Senator WATSON. Take red clover, for instance. Do we produce enough red clover in the United States to supply the domestic demand?

Mr. SCARLETT. No, sir.

Senator WATSON. Every year there is an import?

Mr. SCARLETT. Every year there is an import, sir. In the last 10 years, from 1910 to 1920, the average import of red clover was 10,494,254 pounds.

Senator WATSON. Is the same true of white clover, alsike, and other clovers?

Mr. SCARLETT. Yes, sir, in proportion.

Senator MCLEAN. Is there a profit in raising it, or is the margin very close?

Mr. SCARLETT. I have heard it from some farmers, sir, that they would rather buy their seeds and pay a big price than to let it go to seed, because they had a greater value in the hay or the green manuring by turning it under to enrich the soil than to let it go to seed and cut if off at a critical time of the year and allow the soil to be exposed to the heat of the sun.

Senator MCLEAN. Still, it is raised in large quantities for seed purposes, and I did not know but what you would be able to answer the question as to whether the margin of profit was very small or not. There might be a large profit in raising it for hay. There would be if the transportation charges could be reduced. There is a great market for alfalfa in the East, as it is considered the highest quality of forage in the East, and we would like to get it from the West, but the freight rates are so high that it is almost impossible for us to buy in competition with other grasses, and I was wondering whether there was very much profit in the seed in the vetch. I think it is an industry that should be stimulated in this country if possible, because it is an expensive part of the farmer's outlay if he seeds much. The seeds are very high.

Mr. SCARLETT. The Agricultural Department have tried to stimulate the production during the war, but many of them found it n

rofitable to turn it under and use if for other crops rather than to et it go for seed, and that is why we would like to get the seed here heaper if possible if it is of good quality.

Senator SMOOT. Senator, many western farms use it ever so often o turn under for fertilizer. It is a splendid fertilizer. The roots o down very deep, and not only that, they turn it under as fertilizer nd then rotate the crops, and then put alfalfa back again. It is ot because of the importation of seed, nor any demand at all.

Mr. SCARLETT. You take an item such as hairy vetch, which is ecoming of considerable importance in the United States. It is rown very little here, and it is sown on farm lands in the South, nds which are almost valueless. It is the most wonderful thing the outh has had in years. It is rejuvenating that whole section. I nderstand that land down there is very cheap; in fact, I have been old that it could be bought at $5 or $10 an acre. That looks wfully cheap to me. However, I have been told that is a fact. It ould cost them $1.20 an acre to put hairy vetch on that land, nd they will not do it, sir. Vetch will not be produced in those ctions. That will just be a loss to this country; and it is used as n introductory crop to get that ground in condition to start other rops.

Senator SMOOT. How many years would the $1.20 last?

Mr. SCARLETT. With the one seeding?

Senator SMOOT. Yes.

Mr. SCARLETT. I do not know, sir.

Senator SMOOT. That is the same as alfalfa. It costs 40 cents an re for alfalfa, and it can run for 10 years at a cost of 4 cents an re.

Mr. SCARLETT. That is if they are continuing to let it grow up in falfa, but if they want to rotate it would be for only one year.

Senator SMOOT. That is done for fertilizing and nothing else?

Senator McCUMBER. In many of the arid sections, where they do ot have considerable money and do not irrigate, it will not last ree years.

Senator SMOOT. You can not grow it unless you do irrigate.

Senator McCUMBER. Oh, yes; you can.

Senator SMOOT. Mighty little of it.

Senator McCUMBER. It is grown all over this country where they not irrigate. It is grown in my State, and they do not irrigate it.

Senator SMOOT. They do not raise very much seed unless they igate.

Mr. SCARLETT. Mr. Smith has just called my attention to the t that this $1.20 additional is the tax and not the base cost of e seed.

Senator SMOOT. We all understood that.

Mr. SCARLETT. And the price that we paid, according to this table, s as of July 9, and I might say that in anticipation of this duty ices of nearly all imported seed have advanced approximately 25 r cent, and there is a howl from the farmers at the present time y they should be paying so much more when everything is being flated.

You spoke of growing clover, alfalfa, etc. You know in such ates as Pennsylvania they grow large quantities of red clover. ll they are the greatest buyers of red-clover seed. There is more

red clover bought in Pennsylvania than any other State, I think. Nevertheless, they raise red clover there; and that is because it pays them better to turn it under, I presume, and buy red-clover seed from outside sections.

Senator McLEAN. How far north is the hairy vetch profitable?

Mr. SCARLETT. It grows in Michigan. Whether it is grown to any appreciable extent in Canada I do not know. But I do know that it grows in Michigan.

Senator McCUMBER. Where do you get the seed from the outside?

Mr. SCARLETT. The best hairy vetch comes from Sweden. Hairy vetch also comes from Germany, Czechoslovakia, and Central Europe.

It is a fact, of course, that the tariff will inflate prices, and these duties will be paid by the farmers, and we hope you gentlemen will have in mind that there are many, many more farmers who buy seeds than there are who grow them, and it is for that class that we are speaking.

Senator SMOOT. Many more who buy wheat than grow it?

Senator McCUMBER. What?

A VOICE. It is on the free list.

A VOICE. Some one says it is on the free list.

Senator SMOOT. That is all he knows about it.

Mr. SCARLETT. There are sections in this country where they raise certain seeds. Red top is raised in Illinois, but it is not imported. Timothy seed is raised in Iowa, but it is not imported. It being on the free list does not affect them at all; it does not affect those seeds that are raised in sufficient quantity in America to supply our consumption.

Senator DILLINGHAM. Can you state just what is raised in this country and not imported among the seeds? You have mentioned two or three.

Mr. SCARLETT. Timothy seed and red top.

Senator SMOOT. Red top is imported, is it not?

Mr. SCARLETT. Not to any great extent, I think. There may be a little; if there is a change in the market, it may come back; that is American seed.

Senator McLEAN. Timothy seed is included in 761. But you say it is not imported?

Mr. SCARLETT. No, sir. We raise enough timothy in this country to supply the home demand and export some.

Senator McCUMBER. What other varieties do we raise enough of?

Mr. SCARLETT. None except red top, and if they are on the free list it does not affect them.

Senator McLEAN. What do you say about the rates, if we are to retain any rates? Are they fairly comparable to the prices here as contained in 761?

Mr. SCARLETT. That is a question the farmer would have to answer. I could not answer that.

Senator McLEAN. In maintaining an ad valorem equivalent some would be much higher than others?

Mr. SCARLETT. Yes.

Senator DILLINGHAM. What do you sell alfalfa seed for?

Mr. SCARLETT. Alfalfa seed at the present time is worth 20 cents a pound.

Senator DILLINGHAM. And the duty is 2 cents a pound?

Mr. SCARLETT. That is an advance of 4 cents a pound in the last our weeks—the price I mentioned.

Senator DILLINGHAM. What are you selling crimson clover for?

Mr. SCARLETT. We are selling crimson clover at 9½ cents a pound.

Senator DILLINGHAM. And the duty is 1 cent?

Mr. SCARLETT. Yes, sir.

Senator DILLINGHAM. What about red and white clover?

Mr. SCARLETT. Red clover is selling at about 19 cents a pound.

Senator DILLINGHAM. And the rate is 2 cents?

Mr. SCARLETT. It is 3 cents, sir.

Senator DILLINGHAM. And white clover?

Mr. SCARLETT. White clover is selling at 30 cents a pound.

Senator DILLINGHAM. And the rate is 3 cents?

Mr. SCARLETT. Yes, sir.

Senator DILLINGHAM. What do you sell timothy for?

Mr. SCARLETT. Timothy is selling for about 6 cents a pound.

Senator DILLINGHAM. And the duty is 2 cents, according to this ill?

Mr. SCARLETT. Yes, sir.

Senator McLEAN. How many pounds are there in a bushel of mothy?

Mr. SCARLETT. Forty-five; that is about $2.70 a bushel.

Senator McLEAN. That is a pretty large ad valorem?

Mr. SCARLETT. Gentlemen, that about covers it, as far as the eneral run is concerned.

Senator McLEAN. Do you want to file your brief?

Mr. SCARLETT. Yes, sir. If there is anything I can answer I would e very glad to do it.

IEF OF WILLIAM G. SCARLETT, BALTIMORE, MD., REPRESENTING THE WHOLESALE GRASS SEED DEALERS' ASSOCIATION.

Paragraph 761 of the Fordney tariff bill provides duties on grass seeds per pound follows: Alfalfa, 2 cents; alsike clover, red and white clovers, 3 cents; crimson clover, ent; clovers not specially provided for, 2 cents; millet, one-half of 1 cent; timothy, ents; hairy vetch, 2 cents; spring vetch, 1 cent; and all other grass seeds not specially ovided for, 2 cents.

DEFINITION OF GRASS SEEDS.

As grass seeds have a technical meaning unknown except by those acquainted with subject, grass seeds are defined and known within the contemplation of the United ates tariff laws, agriculturally, and in the seed trade, as the seeds producing all fodder, sture, and fertilizing plants, i. e., speaking botanically, the two great groups called amineae and Leguminosae, plus rape, a member of the mustard family.

Therefore the term "grass seeds" covers practically all the agricultural or field-sown ds, except the cereals like corn, wheat, rye, oats, etc., which, though botanically sses, yet, under the tariff laws and agriculturally, are not considered grasses.

AGRICULTURAL IMPORTANCE OF GRASS SEEDS.

Compared with other commodities, grass seeds may not appear to have a large money ue. The Bureau of Markets of the United States Department of Agriculture has de an estimate, probably only a rough estimate, that the average yearly production ll grass seeds, domestic and imported, in the United States is 400,000,000 pounds, ued at between forty and fifty million dollars.

No mistake, however, must be made as to the really tremendous values of the prod- of these grass seeds.

The average annual hay crop of the 48 States from 1911 to 1920, farm value, i. e., ue to the producing farmer, was $1,613,896,000.[1] Estimates of the very large value

[1] Statistical Abstract of the United States, 1920, Bureau of Foreign and Domestic Commerce, p. 144.

of other products of grass seeds could be cited from the same authority. Yet there [illegible] no means of ascertaining the imposing value of crops from leguminous seeds which are plowed under for green-manuring for soil improvement.

During the last war seeds were held of such prime importance that the various Government departments classed them with munitions or food products in all priority classifications. Congress passed a special war act to determine the supply and to increase the supply of these seeds.

It is therefore too obvious to require further details that grass seeds, though of perhaps small value, have, by reason of what they produce, a very great effect on the welfare of the country.

GRASS SEEDS UNDER FORMER TARIFF LAWS.

Grass seeds under all the tariff laws of this country have always been carried on the free list. Paragraph 595, Underwood Act of October 3, 1913; paragraph [illegible] Payne-Aldrich Act of August 5, 1909; paragraph 611, McKinley Act of August [illegible] 1894; Tariff Act of October 1, 1890; section 2503, tariff act of March 3, 1883; section [illegible] 8, tariff act of February 8, 1875.

PRINCIPAL REASONS WHY GRASS SEEDS SHOULD BEAR NO IMPORT DUTIES

The American farmer, particularly in his present distressing condition, should not be burdened with the heavy increase in the purchase price of grass seeds which will be caused by the duties assessed in paragraph 761 of the Fordney tariff bill.

The inevitable result of these heavy duties on grass seeds will be to increase the prices of grass seeds whether produced in this country or in foreign countries, because of the economic effect of the substantial elimination of competitive world markets. This is proved by two circumstances:

Certain grass seeds composing a large part of the agricultural demands of this country are not produced in the United States to any commercial extent, to wit, crimson clover, alsike clover, hairy vetch, spring vetch, rape, Canada blue grass, rye grass and all the natural grasses.

The following Table A will show in figures the average yearly imports of the [illegible] said grass seeds for the years 1910 to 1920, inclusive, the proposed duty to be assessed thereon by paragraph 761 of the Fordney bill, and the potential revenue to be received from such duties and paid exclusively by the American farmer. This table is prepared from the printed reports of the United States Department of Agriculture.

TABLE A.

	Average yearly imports, 1910-1920.	Proposed tax per pound.	[illegible]
	Pounds.	*Cents.*	
Alfalfa	4,897,026	2	[illegible]
Alsike	2,872,936	2	[illegible]
Crimson clover	5,595,594	1	[illegible]
Red clover	10,494,254	2	[illegible]
White clover	355,696	3	[illegible]
Other clovers	3,595,782	2	[illegible]
Millet	1,592,721	½	[illegible]
Timothy	111,619	2	[illegible]
Hairy vetch	857,259	2	[illegible]
Spring vetch	650,293	1	[illegible]
Other grasses	3,488,909	2	[illegible]
Total			[illegible]

That the Congress may have an even more striking proof of the burden of the duties on grass seeds which are not produced on a commercial scale in this country Table B is given, showing that the American farmer must pay an average of [illegible] per cent more for these grass seeds or at the average rate of 59.1 cents per sowing [illegible] These figures do not tell the entire story, unless one is aware of agricultural conditions. For example, hairy vetch would cost, under this Fordney bill, $1.20 more per [illegible] acre, and as this seed is often sown on poor land of low valuation the duty means [illegible] planting and no production on such land.

TABLE B.

Seeds directly affected by imports.	Current wholesale price per pound.	Proposed import tax per pound.	Resulting wholesale price with duty per pound.	Approximate increase in price.	Tax per sowing acre.
	Cents.	Cents.	Cents.	Per cent.	Cents.
lsike clover	17½	3	20½	17.1	45
imson clover	7½	1	8½	13.3	15
ed clover	18	3	21	16.6	45
hite clover	35	3	38	8.5	36
iry vetch	8½	2	10½	23.5	120
ring vetch	5	1	6	20	60
pe	7½	2	9½	26.6	20
nada bluegrass	18	2	20	11.1	80
chard grass	20	2	22	10	70
ye grass	6¼	2	8¼	32	100

Average increase of above grasses, 17.9 per cent; average increase per sowing acre, 59 cents.

Prices of this table are as of July 9, since which date prices have advanced con-lerably on account of buying abroad in anticipation of the duty.

Certain grass seeds, namely, red clover, white clover, orchard grass, and millet, e grown on a commercial scale in the United States, when, if at all, the so-called otective doctrine might be a consideration. On the contrary, such a duty is un-cessary and inadvisable for the following reasons:

The domestic crop never has been able to supply the demand of American farmers these domestic-grown grass seeds, as shown by the following statistics compiled Government departments:

Clovers.—The domestic acreage and production of all varieties of clovers, which nstitute the largest item of domestic-grown grass seeds, including crimson and ike clovers, for the year 1918, to be sold for planting in the year 1919 was, according the Crop Reporter of the United States Department of Agriculture, issue of September 1919, 66,120,000 pounds. Page 499 of the Department of Commerce report for the ar 1919 showed an importation into this country of all clovers of 25,041,898 pounds. erefore, the American farmer demands 38 per cent more clover than is produced the United States. These figures are typical of other years.

Millet.—While millet is grown on a commercial scale in this country, yet, as shown the last-mentioned report, 1,775,226 pounds were imported.

 most significant fact is that red clover and alfalfa, composing the largest pro-tion of these domestic-grown grasses, are what is called "Incidental seed crops." erican farmers do not grow these crops expressly and solely for the production eeds. Other important issues enter into the disposal of these crops, viz, the cur-t or prospective market value of hay. If hay is or may be high the crops are hered to be sold for fodder. If the farmer, at the approach of harvest, finds a seed p more valuable he allows the crop to ripen for seed.

n elevating the costs of grass seeds to farmers by this Fordney tariff bill, Congress avoring a few seed growers in a few limited sections of the country at the expense he vast majority of the American farmers.

lost of the meadow fescue seed crop of the United States is produced in four coun-in eastern Kansas. (Seed Reporter, U. S. Dept. of Agriculture, issue of Novem-1917, p. 4.)

ed top grass seed crop is produced in southern Illinois and Indiana.

ighty per cent of the domestic production of timothy seeds comes from certain s of four States, Missouri, Minnesota, Illinois, and Iowa. (Seed Reporter, issue ug. 10, 1918.)

lfalfa seed is produced by a few Western States. Most unfortunately this supply, bly in the States of Utah, Colorado, and Idaho, is becoming unavailable for seed plies because the producers can not or will not properly clean their fields of ious weed seeds. Some of these weed seeds can not be removed by cleaning hinery, and in other cases can only be removed with such difficulty that the ng price of the recleaned seed is well nigh prohibitive in certain markets.

he tariff on grass seeds will, by seriously increasing the purchase price to the erican farmer result in the curtailment of planting and consequently of produc-. It is well known to the seed trade that any material increase in prices of seeds uickly reflected in diminished sales.

Higher prices for grass seeds caused by paragraph 761 of the Fordney tariff bill [illegible] drive the small, and too often the large farmer to buy cheaper, inferior, and [illegible] infested grass seed. The purchase of such seed containing large quantities of [illegible] weed seeds will be a calamity, will disastrously affect the economic value of [illegible] the land, lower tax valuations, and nullify the effect of the valuable work [illegible] United States Department of Agriculture and the agricultural departments of [illegible] States to educate the farmer to buy even at higher prices the highest quality of [illegible] practically free from noxious weed seeds.

The American farmer who buys grass seeds to plant is in such a condition th[illegible] Congress should not increase his burdens by higher priced grass seeds. This Ford[illegible] bill admits duty free agricultural implements (par. 1504) and other benefits. [illegible] reverse this policy by putting grass seeds on the dutiable list? If this duty is [illegible] of protection the benefit can not attach to a large proportion of the grass seeds [illegible] are not domestic grown, nor should this policy be adopted where, as in this case, [illegible] a small number of growers are to be benefited at the cost of the vast major[illegible] farmers.

The duties on grass seeds mean no appreciable increase in revenue. See Table [illegible] which shows this amount of potential revenue to be $740,410.95. But the Gover[illegible]ment will not realize even this sum because imports will lessen very considerabl[illegible]

The official tables of statistics of exports of grass seeds from this country show [illegible] these seeds are depending on the world markets, freely offered in competition with [illegible] world. This condition shows that protection is not needed as far as growing see[illegible] considered.

Seedsmen have made diligent inquiry to ascertain from official sources the rea[illegible] why the House Committee on Ways and Means has attempted to reverse the p[illegible] of all former tariff laws by placing grass seeds on the dutiable list in this bill with [illegible] following results:

We understand that neither the Treasury Department nor the United States [illegible]partment of Agriculture have suggested or approved duties on grass seeds in this [illegible]

The only reason assigned by the chairman of the subcommittee of the House W[illegible] and Means Committee for the duties was to prevent importation of low-grade [illegible] seed. The complete answer to this is that there has been a Federal statute called [illegible] Federal import seed act of August 20, 1912, which has efficiently operated to pre[illegible] the importation of low-grade grass seeds for the last nine years—a fact which wa[illegible] known to the chairman of this subcommittee.

CONCLUSION.

There is no sound reason for imposing these onerous duties on grass seeds, but [illegible] the strongest claims of the American farmers for free grass seeds as in all former [illegible] laws.

Therefore, paragraph 761, imposing duties on grass seeds, should be stricken o[illegible] the Senate Committee on Finance and by the Senate, and the conferees of the S[illegible] with the conferees of the House should insist on such amendment. Grass seeds sh[illegible] be inserted in the free list of the tariff bill in the appropriate place.

GARDEN SEEDS.

[Paragraph 762.]

STATEMENT OF KIRBY B. WHITE, DETROIT, MICH., REPRESENT[illegible] THE AMERICAN SEED TRADE ASSOCIATION.

Mr. WHITE. Mr. Chairman and gentlemen of the committee[illegible] association comprises practically all of the importers of garden s[illegible] I wish to ask you to refer to paragraph 762, on page 106 of the [illegible] which is stated, "Garden seeds, not otherwise specially provid[illegible] 20 per cent ad valorem."

We ask simply this, that you make that duty specific rather [illegible] ad valorem. It was specific under the Aldrich Act. It is sp[illegible] now under the Underwood Act. It ought always to be speci[illegible] cause of the practical difficulties in appraising the value of g[illegible] seeds.

Your committee recognized this difficulty in 1909 when the bill ame from the House, indicating the duties as ad valorem, and hanged the form of assessment at the request of the American Seed 'rade Association.

The reason for the very great difficulty of appraisal is that every lot f garden seeds is an individual lot, precisely as every Holstein cow s an individual cow. The value in the one case may be four times he value in the other case.

If you wish a duty which is equivalent to 20 per cent, as indicated n the bill, approximately 6 cents per pound would be the right mount based on the last 10 years average on foreign valuation. Vith American valuation it would probably be more.

The importers will cheerfully abide by any rate, 5 cents, as in the resent act, 6 cents, 10 cents, as was provided for in the Aldrich Act, r 15 cents, so long as you relieve us of the burden of declaring a narket value which exists only in the opinion of the Treasury Department.

Are there any questions?

Senator McCUMBER. Nothing, thank you.

DRIED BEANS.

[Paragraph 763.]

BRIEF OF GEORGE R. SIEVER, REPRESENTING THE FOREIGN COMMERCE ASSOCIATION OF THE PACIFIC COAST.

We invite your attention to paragraph 763 of the Fordney tariff bill, wherein dried beans are given a duty of 1¼ cents a pound, an increase of 200 per cent over the rate on this commodity in the tariff act of 1913.

We respectfully urge that your committee amend this item so as to assess dried beans not more than one-half cent per pound. This recommendation is made in consideration of the following facts, which will be fully established in this statement:

1. The proposed duty is not necessary for the protection of domestic producers because recent losses of domestic producers were not the result of foreign competition, but were due to economic causes.
2. The proposed duty is not necessary for the protection of domestic producers because their claims that importations adversely affect the domestic industry are not borne out by an analysis of conditions during normal years, or even during 1917-18.
3. The proposed duty is not necessary for the protection of domestic producers because the 1917-18 situation upon which they base their demands has been reversed since 1919.
4. The proposed duty is not necessary for the protection of domestic producers because competition between domestic and foreign growers for American markets is already on a basis favorable to the domestic industry.
5. The proposed duty will not benefit the Government because it is so excessive as to impair its value as a revenue producer.
6. The proposed duty will be detrimental to the interests of the consuming public because it will unnecessarily raise the price of a staple food product.
7. The proposed duty will not serve the best interests of the country because it will injure our trade relations with important purchasers of American products and adversely affect the many industries engaged in foreign trade.

Following is a summary of figures on the bean industry, which will be frequently referred to herein.

Production statistics were obtained from the Yearbooks of the Department of Agriculture and the Statistical Abstract for 1920 (figures for 1910-1913 being given in the only form available, an average of the crops of those years).

Imports statistics from 1910-1918 were secured from the Tariff Commission handbook entitled "Imports and Duties, 1908 to 1918, inclusive;" for 1919-20 from that commission's "Survey of the American Bean Industry."

Figures on exports were found in the series of the Bureau of Foreign and Domestic Commerce, "Foreign Commerce and Navigation of the United States."

The bushel used as the unit of measure contains 60 pounds of beans.

Year	Production	Imports	Exports	Year	Production	[illegible]
	Bushels	Bushels	Bushels		Bushels	Bushels
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]			
[illegible]	[illegible]	[illegible]	1,234,000	Total	[illegible]	[illegible]
[illegible]	[illegible]	[illegible]	[illegible]			

First point: "The proposed duty is not necessary for the protection of producers because their recent losses were not the result of foreign competition were due to economic causes."

Although domestic growers claim that "beans are the only important food that have sold at prices materially lower than the price of the ... Beans are the only important food product which have sold below the cost ... tion." California Bean Growers' Association brief, House hearings, ... committee knows such circumstances to be general throughout the ... industry.

While domestic bean growers, in common with producers, importers ... of all agricultural commodities, recently suffered heavy losses due to a decline value of their product, their losses were only the natural result of a reaction abnormal economic conditions that previously obtained.

The fact that the same losses were sustained by producers of crops ... marketed practically without foreign competition and by importers ... produced in the United States, as well as by growers of beans shows ... cause of the recent price decline to be economic and certainly not amenable ... tion.

In this connection, attention is called to the heavy decline that took ... prices of such varied products as cotton, iron and steel, petroleum, and ... the case of every one of the commodities referred to the competition ... negligible yet prices declined equally as violently in these lines as in the case ...

Then again, commodities that are not produced in this country and ... domestic competition also declined heavily, silk, coffee, and burlap being ...

The fact that the decline that affected beans also affected almost all com... domestic and imported, is very strong evidence to show that the cause of the ... in the price of beans was fundamentally economic.

Second point: "The proposed duty is not necessary for the protection of ... producers because their claims that importations adversely affect the ... industry are not borne out by an analysis of conditions during normal years ... during 1917–18."

Taking only the figures for 1917–18, when most abnormal conditions pr... domestic growers endeavor to create the impression that the market has been ... with foreign beans, bringing down prices to the producer and generally dis... the industry. Also that such a condition will become permanent if a high ... tive tariff is not enacted.

Yet looking into the facts of the matter we find that while imports greatly ... during the war years, the same was true of domestic production. In terms of ... imports jumped from 1,617,000 bushels in 1914 to 2,521,000 bushels in 1917, wh... duction increased from 8,846,000 bushels in 1914 to 16,045,000 bushels in 191...

We also find that even in 1917–18, exports offset imports to a degree that ... domestic growers almost complete protection. In 1917, 2,521,000 bushels ... imported and 2,164,000 exported, leaving a difference of 56,720 bushels to ... flow" a market already dominated by 16,045,000 bushels of domestic ... 1918, 2,459,000 bushels were imported and 2,398,000 bushels exported, lea... difference of only 61,059 bushels to "bear" a market supplied with 1... bushels of domestic beans.

Figures since 1910, which give a much more accurate basis for judgment than for the two war years, show that exports of beans from the United States to ... countries have exceeded imports of beans into the United States during th... period by over 75,000,000 pounds.

Furthermore, the average ratio of imports to domestic production since 1... been, home-grown 89 per cent, imported 11 per cent.

If there were no exports whatever and the whole force of foreign imports ... thrown on the domestic market, it would hardly be reasonable to consider 11 per ... of the marketable beans as controlling a market in which domestic beans are so ... whelmingly predominant.

·e fact that imported beans sold and still sell for less than domestic beans is not to vicious underselling by importers but to the superiority of the American-a product. In accusing importers of weakening the market by consistently rselling them, domestic growers are representing as an evil a situation that is ally one of their strongest protections against foreign competition, namely, the act superiority of domestic beans and the premium always paid for a domestic ɜ over the price given for the oriental variety coming into direct competition it.

is preference of the American buyer for domestic beans is constantly capitalized he growers at from one-fourth to three-fourths of a cent per pound (see Tariff mission's survey of the American bean industry).

·ird point: The proposed duty is not necessary for the protection of domestic ucers because the 1917–18 situation, upon which they base their demands, has reversed since 1919.

·en assuming for the purpose of argument that imports did exert the harmful ence growers claim, which is certainly not the case, the fact that the situation prevailed in 1917–18 has since entirely readjusted itself is another objection to ıer tariff protection at this time.

ıports for 1919 were less than half of the volume imported in 1918, while exports · more than one-third greater than in 1918.

ıports for 1920 were but one-fifth of 1918 figures, while exports were more than ıle the volume of imports.

ith imports four-fifths less than in 1918 and still steadily declining, fear of oriental petition seems hardly justified.

ı connection with the excess of exports over imports, a factor that merits con-ration is the expediency of continuing to import lower grade oriental beans at ratio of 10 per cent of our production and disposing of 17½ per cent of our higher e domestic crop in foreign markets.

uring the past six years this country has exported more than 13,500,000 bushels eans as against the 75,000,000 bushels it produced. In other words, since 1915 exports have amounted to 17½ per cent of our production. Our imports during same period were but 7,500,000 bushels or 10 per cent of our production.

his exportable surplus must compete with foreign beans in the world's markets the price for which it sells must necessarily have an important part in determining price of the commodity at home.

t would seem to be the wiser step to continue to dispose of 17½ per cent of our ns abroad and to import lower-grade oriental beans, equal to but 10 per cent of production in their stead.

ourth point: "The proposed duty is not necessary for the protection of domestic ducers because competition between domestic and foreign growers for American ·kets is already on a basis favorable to the domestic industry."

tariff is enacted with one or both of two objects in view, namely, to protect home ustry, or to provide revenue. Taking up the first of these objects, it is submitted t if home industry is already sufficiently safeguarded, further protection is unneces ·. Or in other words, if (1) the volume of imports is not large enough to threaten ıestic producer's control of the market, and if (2) foreign producers have no advan-es that could make such a situation possible, no further tariff is necessary from the tection standpoint.

'rom statistics given above, it was seen that imports when compared with domestic duction, are relatively small, amounting to less than 10 per cent of the domestic p in normal times.

t is more difficult to establish the relative competitive positions of foreign and nestic producers with regard to American markets as definite figures are not avail-e. It is interesting to note, however, that the statements of domestic growers as he low production and marketing costs of foreign beans, contrasted with the small ume of beans imported, show such a discrepancy as to almost of themselves refute charge that imported beans have a competitive advantage.

udging from the small amount of beans imported either those who bring in this nmodity have the advantage over domestic producers in competition for the Ameri-ı markets and do not use it, or the charge that they have such an advantage is in or. As it is hardly probable that importers or members of any other industry uld fail to use any advantage in their favor to increase the volume of their business · only conclusion to be reached is that they actually do not possess any such com titive advantage.

That the latter situation is the true one is seen from the following comparis[on] factors involved in marketing domestic and foreign beans:

AMERICAN BEANS.	ORIENTAL BEANS.
1. Expensive but efficient labor.	1. Cheap but inefficient labor.
2. Modern machinery.	2. Crude implements.
3. Latest improved methods of cultivation.	3. Antiquated and unscientific meth[ods] of cultivation.
4. Large-scale production.	4. Small-scale production.
5. Close to consuming markets.	5. Thousands of miles from Ameri[can] markets.
6. Speedy but expensive transportation.	6. Slow and expensive land and inlan[d] water transportation.
7. No exchange problem.	7. Risk from exchange fluctuations du[r]ing course of conversion from native currency, to tael, to gol[d] dollar; or from silver yen to gold yen, to gold dollar.
8. Producer, broker, jobber, and retailer exact profit before goods reach consumer.	8. Interposition of numerous middlemen involves substantial profit to eac[h]. During course of marketing, bea[ns] pass through hands of grower, native dealer, broker, exporter, broker, importer, broker, jobber, retailer, and finally consumer.
9. No ocean transportation.	9. Ocean transportation, another fac[tor] of fluctuating cost.
10. No marine insurance.	10. Marine insurance cost.
11. No import duty.	11. Import duty.
12. Preferment by American buyers bringing premium of one-fourth to three-fourths cent per pound.	12. Must be sold at a price one-fourth [to] three-fourths cent per pound [be]low price enjoyed by dome[stic] product.

Even from the brief contrast above, which is confirmed by the survey of the indu[stry] by the Tariff Commission, some idea may be gained of the intricate and costly pro[cess] of marketing foreign beans and the numerous advantages of domestic producers t[hat] entrench them so solidly in the market they control.

Certainly no additional tariff to further strengthen domestic growers' domina[nt] position is necessary or desirable.

Fifth point: "The proposed duty will not benefit the Government because it [is so] excessive as to impair its value as a revenue producer."

As noted above, one of the two objects of a tariff on imports is to bring in reven[ue].

It is elementary to state that an excessive duty will entirely shut out or seri[ously] restrict importations of the commodity it covers, and hence have little value a[s a] source of revenue.

It is also hardly necessary to point out that if imports of a given article were decli[ning] under a moderate tariff, an increase of that rate by 20 per cent would probably [act] as an absolute check of the movement.

Yet these fundamentals seem to have been overlooked in fixing the rate of du[ty on] beans.

Previous to the enactment of the emergency measure, a duty of 25 cents per b[u]... was in force. Yet under this moderate tariff there was a steady decline in im[ports]. In 1919 only one-half as much beans were brought in as during 1918, and in [1920] the volume imported was less than one-half of that of 1919. Exact figures will be [found] on page 2 of this brief.

While this decline would no doubt have continued, the effect of the emergency [act] was to bring the movement to an abrupt standstill.

Figures of imports through Seattle, the principal port of entry for this commo[dity] show that while 13,230,000 pounds of beans came in during the months of June a[nd] July, 1920, not one pound was imported during June and July, 1921.

The fact of the matter is that the marketing process through which oriental [beans] must pass is so involved and expensive that a duty higher than one-half cent [per] pound is prohibitive.

Intended as an embargo measure, the emergency act served its purpose well [par]ticularly in the case of beans. The imposition of any rate above one-half cent ...

›und in the permanent bill will have a similar effect and will certainly defeat its ırpose if it is expected to yield a revenue.

Sixth point: "The proposed duty will be detrimental to the interests of the consuming public, because it will unnecessarily raise the price of a staple food product."

It is well known that beans are a highly nutritious food. On account of their meat ılue and many uses they are a staple article of diet in the homes of the middle and boring classes and are particularly esteemed by those of foreign extraction. Their ide military use shows that as a cheap and concentrated ration they are unexcelled. In the interests of the consuming public, it is unquestionably desirable that beans : sold at as moderate a price as will give a fair profit to the producer.

If a duty is provided that will give domestic growers a corner on the home market, ices will naturally rise and domestic beans will bring more than a fair return at the ›nsumers' expense.

Then again, due to rain damage, drought, frost, disease, and vermin, which affect ›ans, both growing, harvested, and stored, they are a risky crop and heavy shortages casionally occur.

With an excessive duty in force, years of domestic crop failure will be the only years which a tariff will be operative. With prices soaring and protection for domestic ›oducers even less necessary, the consuming public will be forced to absorb the import ıty.

Therefore, as the effect of an increased duty in years of normal production will be subsidize the grower at the consumer's expense, and in years of crop failure to ace a tax on a staple article of food which must also be paid by the consuming public, e submit that not only is no additional duty desirable but such an increase would against sound public policy.

Seventh point: The proposed duty will not serve the best niterests of the country, ›cause it will injure our trade relations with important purchasers of American ›oducts and adversely affect the many industries engaged in foreign trade.

Much effort has been spent, particularly during the past few years, by our Government and private agencies to aid American industries in entering foreign fields.

In this connection it has been recognized as a fundamental economic fact that there ust be a reciprocal exchange of commodities; that foreign buyers are unable to purase American goods unless credits are established in their favor by the importation their products; that transportation of American goods overseas can not be economilly and efficiently conducted unless there is cargo both ways.

American imports of beans, one of the Orient's important crops, place America ›llar credits at the disposal of Japanese and Chinese sellers, which in turn can be ›ed, and are used, to buy American machinery, textiles, lumber, steel, chemicals, ain, etc. The enormous populations of these countries are just beginning to demand e products of western civilization and opportunities are perhaps more promising r the sale of our products in these countries than in any other section of the world. is evident that to injure our trade relations with these countries by erecting a riff barrier against their products would be most unwise.

But important as foreign trade is to our manufacturing industries, our merchant arine and our import and export trade and its many allied industries depend upon for their very existence.

It may seem far-fetched to point out in connection with the tariff consideration of ıt one commodity the millions of dollars invested in and the hundreds of thousands persons dependent on these industries. But the emergency measure, covering ly a scattering list of commodities, has proven so disastrous to commerce that it is ›t entirely irrelevant to note in connection with beans that any step tending toward e diminution of imports will adversely affect, to a greater or lesser extent, the ›porter, the steamship company, the dock company, the weigher, the chemist, the arehouseman, the railroad company, the bank, and all other affiliated interests. ›ese are important lines of domestic business and in conclusion we respectfully quest that the same protection be given them as is given to other domestic industries.

(Indorsed by the following: Port of Seattle Commission, W. T. Christensen, president; Importers and Exporters Association of Seattle, H. A. Kimball, president; ıstomhouse Brokers Association of Seattle, J. P. Hansman, president.)

BEANS, PEAS, AND LENTILS.

[Paragraphs 763, 765, and 767.]

STATEMENT OF EMIL S. NORDLINGER, REPRESENTING DRIED FRUIT ASSOCIATION OF NEW YORK.

Senator McCUMBER. You desire to speak with reference to paragraph 763, do you—dried fruit?

Mr. NORDLINGER. Paragraphs 763, 765, and 767.

I have been requested by the Dried Fruit Association to suggest to you that the duty under the Payne-Aldrich Act be retained.

We do not import any dried beans to speak of when we have normal crops here. They are only imported when the crops are short or when there is a crop failure. They are used principally by poor people. The principal consuming districts are the mining and lumber districts. It would be an injustice to the consumer to put a duty of 2 cents a pound on cheap articles like dried beans, or 1, as suggested.

I refer to ordinary navy beans. Before the war we used to import them from Rumania and Hungary and some from Russia. During the war they came in from Japan. What the outcome will be when conditions become normal nobody can tell. We do not know whether we will be able to import them from Europe again.

On dried peas the present duty is 17 cents. It is proposed to raise the duty to 75 cents a hundred pounds, which is three-quarters of a cent a pound, and is entirely out of proportion to the value of the goods. The wholesale value of dried peas is about 3 cents a pound—the white or green peas—and three-quarters of a cent would mean 25 on the value.

Senator JONES. Are you an importer or grower?

Mr. NORDLINGER. We are importers. We also deal in domestic beans and peas.

Lentils used to come from Russia before the war. The only other country that produces them is Chile; but when conditions become normal again Russia will probably produce them and be able to export them. They used to cost in Konigsberg 2 cents a pound. They have been sold here to the poor Italian and Russian people at 2 pounds for 5 cents, but the average price was about 5 cents a pound retail. Now it is proposed to put a duty of 2 cents a pound on this article. They are not grown in this country; and the Dried Fruit Association thinks it would be an injustice to the poor people to put a duty of fully a hundred per cent on a cheap article of food.

Senator JONES. Do we not produce in this country something just as good to take its place?

Mr. NORDLINGER. We grow similar articles, like beans and peas. They are similar food articles. But lentils is an article which is consumed principally by Italians and Russians. They are accustomed to it at home, while the Americans do not use it much except as a side dish. It is eaten principally, or exclusively, by very poor people. To make the cost to them double it seems to us is an injustice.

If you will permit me I will submit a brief.

Senator McCUMBER. Very well; you may.

Mr. NORDLINGER. Thank you.

BRIEF OF EMIL S. NORDLINGER, REPRESENTING THE DRIED FRUIT ASSOCIATION OF NEW YORK.

At a meeting of the Dried Fruit Association of New York, held on August 3, 1921, the undersigned committee has been instructed to protest against the increase in duties on beans, peas, and lentils proposed in the tariff now under consideration by your committee.

We respectfully submit herewith arguments in support of our contentions:

Beans: Paragraph 763. The duty on this article under the act of 1913 is 42 cents per 100 pounds (25 cents per bushel); under the emergency tariff, 2 cents per pound, while the law as passed by the House of Représentatives provides for a duty of 1¼ cents per pound, and a motion has been made before your committee to advance this to 1¾ cents per pound.

It is not necessary to enter into the question of nutritious merit. It is well known that beans are staple food for the poorer classes. In normal years the United States produced about 10,000,000 bushels, and the statistics show that excluding the war years the average excess of imports over exports has been less than 1,000,000 bushels. In fact, during the years 1897, 1898, 1899, and 1907 there were more exported than imported. This proves that in normal years there is no necessity to import beans from other countries. Only in years when due to climatic conditions the crop is short can any material quantity be imported profitably, and just in those years when prices in this country would tend to become excessively high import from abroad would mitigate this condition for the consumers, who can ill afford to pay fancy prices for a necessity of life. The price of beans in foreign countries on varieties which formed the largest part of importation before the war was about 2½ cents per pound f. o. b. point of origin; the duty of 1¼ cents per pound would be equivalent to 50 per cent; 1¾ cents per pound would be proportionately higher. To tax the poor man's food to such an extent is unreasonable and unjust, when it is proposed to assess a duty of 28 per cent on caviar, 33⅓ per cent on mushrooms, and 22 per cent on goose livers, which are luxuries, and an increased duty will not benefit the grower in years of normal yield, as the supply in this country is sufficient for normal demand. It would only injure the consumer in years when the crop is insufficient for normal demand, and in those years the grower will obtain a higher price for his product anyway, as a shortage in this country would tend to increase the price proportionately. If, however, during years of normal production prices should be held higher by the growers, it would tend to divert the export orders which generally come from Cuba and other West Indian islands to Canada or other foreign producing countries.

Peas: Under paragraph 767 it is proposed to tax dried peas 75 cents per 100 pounds; split peas, 1 cent per pound. The present duty is 10 cents per bushel (17 cents per 100 pounds) on dried peas and 20 cents per bushel (33 cents per 100 pounds) on split peas. This also is an article of food which is used almost entirely by poor people, and it is generally produced in sufficient quantities for the United States consumption in this country. As the United States Department of Agriculture does not separate beans and peas in their statistics, we can not furnish any figures regarding this article, but our experience has been that in years when crops in this country were normal dried peas could not be imported from abroad and compete with the price of the domestic product. An increased duty would therefore only tend to increase the cost to the consumer without bringing any money into the United States Treasury.

Lentils: In paragraph 765 it is proposed to increase the duty on this article to 2 cents per pound, the present duty being 25 cents per bushel (42 cents per 100 pounds). This article is not grown commercially in the United States. The increased duty would therefore not help any grower, but simply put a burden on the consumer. The consumers of lentils are mostly poor laboring people, who buy this on account of its exceptional food value. Before 1914 95 per cent of the lentils imported were grown in Russia, shipped from there to Koenigsberg, where they were screened and cleaned, and thence forwarded to other parts of the world. The average price in Koenigsberg was about 2 cents per pound. A duty of 2 cents therefore would mean an increase to the consumer of 100 per cent, which is certainly altogether out of proportion when you consider that lentils are purchased by people who can ill afford to be taxed in this manner.

We, therefore, respectfully request that the rates be changed to the rates in force under the Payne-Aldrich bill, which were: Beans, 45 cents per bushel (75 cents per 100 pounds); lentils, 45 cents per bushel (75 cents per 100 pounds); dried peas, 25 cents per bushel (42 cents per 100 pounds); split peas, 40 cents per bushel (66 cents per 100 pounds).

Foreign trade of the United States in beans and peas, dried, years ending June 30, 1890–19[illegible].

Year ending June 30—	Imports.	Exports, domestic.	Excess of imports.	Excess of exports.

MUSHROOMS.

[Paragraph 766.]

STATEMENT OF A. G. HUPFEL, NEW YORK, N. Y.

Mr. HUPFEL. Mr. Chairman and gentlemen, Mr. Jacobs and I w[illegible] talk on mushrooms. I am speaking with reference to the mushroom growers of the country and he will speak on the canned mushroom[illegible] I am asking you to leave the tariff as arranged by the Ways and Means Committee the same as they have arranged it. I am asking f[illegible] the protection of a real infant industry. I am the first man that ha[illegible] ever converted a brewery into a mushroom plantation. During th[illegible] hearing before the Ways and Means Committee one of the gentleme[illegible] appeared and stated that mushrooms could not be raised in th[illegible] country. I have brought along some photographs taken by the In[illegible]ternational Film Co. and the Thompson people, who furnish pictur[illegible] for all the Sunday pictorial papers of the country, and I show [illegible] pictures of an old brewery that has been turned into a mushroo[illegible] plantation.

Senator CALDER. When did you begin this work?

Mr. HUPFEL. We were put out of business during the war by pr[illegible]hibition, and after looking over 25 or 30 industries I finally decid[illegible] to go into this industry, finding that a brewery could be used for th[illegible] purpose; and I have letters here showing that a great many brew[illegible] of the country are turning their minds now to raising mushroom[illegible] I have one letter here from the Frank Fehr Brewing Co. They hav[illegible] already started. They now have about 20,000 feet under cultiv[illegible]tion, and they are going to increase that this year to 100,000.

I have a letter also from the Moerschel Co., of Sedalia, Mo. They lso want to take it up. I have another one from the Houseman rewing Co., of Madison, Wis. Another from the Sheeby Spring Brewig Co., of St. Charles, Mo. Another one from the Stroh Brewery, of etroit, Mich.

You see what I have done here [exhibiting photographs] is to open new field, and I feel that with proper protection, such as the Ways id Means Committee of the House has provided for us, this struging industry, which was started in this country, I understand, oout 12 or 15 years ago, can flourish. This industry, I found on vestigation, raises about a million pounds of mushrooms a year, id there are imported about eight to nine million pounds.

Senator LA FOLLETTE. The members of the press here are very derous of knowing whether these mushrooms grown in the breweries ntain a "kick."

Mr. HUPFEL. Senator, if I told you it contained over 2.75 I am raid our sales would be so increased that we could not fill the orders.

Senator JONES. What is the tariff on mushrooms now?

Mr. HUPFEL. The industry has been under a tariff of about 2½ nts a pound.

Senator JONES. I have not the bill before me. Is that what the ouse bill provides?

Mr. HUPFEL. The House bill provides for 33 per cent ad valorem, nerican valuation.

Senator JONES. What difference will there be between the two es?

Mr. HUPFEL. We figure that the rate will be about 35 cents a pound der the American valuation.

Senator JONES. It is raised from 3 cents to 35 cents?

Mr. HUPFEL. Two and one-half cents is nothing. It is not even a iff for revenue.

Senator JONES. You started in this business when the tariff was 2½ ts?

Mr. HUPFEL. During the war when they could not be imported, n I was put out of business.

Senator JONES. Did you start into the business with the idea that would get protection of 35 cents a pound?

Mr. HUPFEL. Not exactly. I had to use my plant for something. oked over all these various other industries, and none of them were ing the world afire with their profits. I started out on this as e photographs will show you. Let me take this one picture here icating]. This shows the cellars dismantled. This shows you the eriment of using the cubic capacity [indicating]. Those are the den frames, 2 or 2½ feet apart, on which mushrooms are raised. ll show you those same cellars of steel construction, six tiers high, g the entire capacity. The brewery cellars were about the size is room, and to raise mushrooms under this system—the French em—on the floor, was wasting a lot of this room. So we have into it in this manner [indicating on photograph].

Senator McCUMBER. You are satisfied with the rates given by the se?

Mr. HUPFEL. Yes, sir. I merely ask you to hold it, Senator. t is all.

Senator DILLINGHAM. What material are they grown in?

Mr. HUPFEL. Fermented horse manure or compost. It takes about three weeks to ferment that. The spawn is inserted, which is really the plant. The mushroom has seeds or spores, and these are planted, and that spore goes into the compost, the mycelium, as we call it, which is really the plant It reproduces itself and bears fruit and that fruit is the mushroom

Senator CALDER. It is your idea that if proper protection is given it will so encourage the industry that you can take care of all of it without any importations at all?

Mr. HUPFEL. I think so; yes, Senator.

Senatar CALDER. And competition would bring down the price of the raw article?

Mr. HUPFEL. That is the fact.

Senator JONES. How many million pounds did you say are imported now?

Mr. HUPFEL. From the records I have here from Washington between eight and nine million pounds.

Senator JONES. How many pounds do you expect to produce in your plant?

Mr. HUPFEL. We expect to get the capacity up next year to about 300,000 pounds.

Senator JONES. Then it will require a number of plants?

Mr. HUPFEL. We are not the only growers in the United States. It will give them a chance. Canada has put a duty of 30 cents upon American mushrooms raised out in the far West. There are a great many mushrooms out in the West, but because of the low price of the imported mushrooms they have been driven out of business from time to time.

Senator JONES. What do mushrooms sell for?

Mr. HUPFEL. It varies. At this particular season of the year, when no fresh mushrooms can be obtained, they sell at 80 cents to $1 a pound. In the height of the season, in the wintertime, they run about 30 to 40 cents a pound.

Senator JONES. You would rather have a specific duty so that you would know what the price was going to be?

Mr. HUPFEL. We would rather have a specific duty, but we are satisfied with what the Ways and Means Committee has done for us.

Senator JONES. Do you think when your mushrooms are selling in this country at 30 to 40 cents a pound an ad valorem duty of 35 per cent would be ample?

Mr. HUPFEL. I think so.

Senator JONES. Then, what about it when they are selling at $1 a pound in the United States? Do you want, then, to get 35 per cent duty?

Mr. HUPFEL. No. When they are selling at $1 a pound——

Senator JONES. You do not need any protection then, do you?

Mr. HUPFEL. The situation is just this, Senator: The American public are not used to using the fresh mushrooms. They use the dried and the canned mushrooms, and about 80 per cent of the mushrooms are ground up for sausage and soups. The imported mushroom breaks the American market for fresh mushrooms.

Senator JONES. Is that seasonal?

Mr. HUPFEL. Yes, sir.

Senator JONES. What seasons of the year?

Mr. HUPFEL. The only season that mushrooms are very high is in e months of July and August; and the reason for that is that they n not be raised without proper refrigerating facilities. There is one ıer mushroom grower who has put in an ice machine, and the eweries have refrigerating facilities. We have refrigerating maines, and thereby control the temperature of the cellars, which is very, very important thing.

Senator JONES. So, then, the price of mushrooms in the United ates actually varies each year, generally speaking, from 30 to 40 nts a pound up to $1 a pound?

Mr. HUPFEL. The high price is only in the summer time.

Senator JONES. So that in the summer time you would have a tariff 35 cents a pound when prices are high, and in the other months of e year from 9 to 10 cents a pound?

Mr. HUPFEL. I assume that the imported mushrooms would regute it to cover those two months. Directly after the war they ported here a whole shipload of mushrooms, one-half a million llars' worth coming in, in cans, and they were held over. Prior to e war it broke the market from something like 60 cents to 30 cents New York. We could not produce them for 30 cents.

Senator JONES. What can you produce them for?

Mr. HUPFEL. About 40 cents.

Senator LA FOLLETTE. What did you say the imports were?

Mr. HUPFEL. Between eight and nine million, I am advised.

Senator LA FOLLETTE. The official statement here is that the total ıantity imported in 1921 was 3,732,459 pounds.

Senator MCCUMBER. That means the fiscal year ending June 30.

Senator LA FOLLETTE. Yes. And in 1920 there were imported 301,000 pounds.

Mr. HUPFEL. I have the figures here of the Department of Agrilture.

Senator JONES. The difference might be in the classification, hether fresh mushrooms or canned.

Senator LA FOLLETTE. These are the total importations.

Mr. HUPFEL. I have the figures here of the Department of Agrilture.

Senator LA FOLLETTE. Here are the official figures of the Treasury epartment [indicating].

Mr. HUPFEL. I do not know where these came from. I will read ıem to you. In 1918, 1,200,000 pounds; in 1919, 2,093,000; 1920, r the first nine months, 2,200,000 pounds. They did not have the gures for the last quarter.

Senator CALDER. They are about the same as the figures you have ad.

Mr. HUPFEL. These are from France.

STATEMENT OF EDWARD H. JACOBS, WEST CHESTER, PA.

Mr. JACOBS. The mushrooms grown in this country at the present me are far beyond the estimates given. The Department of Agrilture asked me to get as close an estimate on the subject as I ossibly could, within the past year, and I figure that there are from ve to six million pounds of fresh mushrooms grown, and they are etting to be used very largely in place of the canned mushrooms. I

myself grew 600,000 pounds last year. Mr. Hupfel grew 200,000 pounds. That amounts to 800,000 for two growers alone. We have at least 250 growers in the East and a good many in the West. There is no doubt but that the American farmer can grow all the mushrooms that can possibly be used in this country, either fresh or canned.

I have just completed a trip through the West investigating the canned-mushroom situation, and the large wholesale dealers told me that from 75 to 80 per cent of all the canned mushrooms imported are used by Chinamen. There are about 900 Chinese chop-suey restaurants in Chicago alone, and about 800 in New York City. They take mushrooms like these [indicating] and cut them up in little slices and lay them across the top of the dish for decorating purposes and serve them to their customers. They prefer the imported mushrooms because they are bleached white and they retain that white color. We know of no means in this country within the law by which we can bleach mushrooms white as marble and have them retain that color without using chemicals, which we could readily do. But the pure-food authorities will not permit us to do that. They are at liberty to come and inspect our plants at any time, but they are not at liberty to inspect the plants in the foreign places where the mushrooms are canned for importation to this country.

So that we, as growers and canners, consider that we have an unfair competition there. We are against the bleached foreign mushrooms when we are not permitted to bleach our own mushrooms. They retain the natural color, which is a cream color, and the natural flavor, and they are just as good as fresh mushrooms——

Senator La Follette. Do you know what chemical is used in the bleaching process?

Mr. Jacobs. Sulphur fumes. That can be used in such a way as to whiten the surface, and there are traces of the sulphur used. When you open a can of fresh mushrooms you can often detect the odor of sulphur, although you can not detect the sulphur itself in the mushrooms. We would not be permitted to do that, and I would not encourage it because it is not necessary. The natural flavor and color are far more desirable. The Chinamen come from across the Pacific and land in our country and go across the Atlantic to get these bleached mushrooms, and come back and feed the American people, who would much prefer to have fresh mushrooms or home-canned mushrooms. I never eat the French mushrooms because I consider that they are flavorless. Any mushroom grower does. I am acquainted with pretty nearly all the mushroom growers, and I know that if the demand in this country warranted growing double the supply of mushrooms in this country they could almost do it in a year; and, as Mr. Hupfel says, thay are going into the mushroom business in every State in the Union that will grow them.

From a canner's standpoint we would like to see the duty increased to 40 per cent. We have never had a duty in this country that would permit us to can mushrooms and sell them on the market. I think it is a shame that we never have.

Under the McKinley law we had a duty of 25 per cent ad valorem. They might as well have been free, because they could put mushrooms into the hotels in this country at one-half our cost of production.

I started in the canning industry and got a lot of mushroom growers ıterested 10 years ago, but the foreign growers put us out of business ght away. We lost everything we put into it, just because their ıbor and other conditions are more suitable to producing mushrooms ıeaply over there. We have very expensive buildings to put up and ɛpensive coal and the disadvantage of the freight rates that we have. used to pay 70 cents a ton for freight. Now I pay $1.40. I used ı pay 16⅔ cents an hour for the best Italian labor, and now I pay ; cents.

If you will give us what we request we will produce mushrooms in ro or three times the quantity, and the benefit all goes to the merican farmer. The growers themselves will can them and sell ıem without any profit if they have to, just to get the trade and get ıe business and grow more mushrooms. I think that is all.

STATEMENT OF GEORGE O'HARA, PRESIDENT OF THE ASSOCIATED IMPORTERS OF FOOD PRODUCTS.

Mr. O'Hara. Mr. Chairman and gentlemen, my name is George Hara. I am president of the Associated Importers of Food Prodts, with headquarters in New York, although our association is a tional one, having members in Boston, Chicago, Philadelphia, and her cities.

Referring to the proposed tariff of 33⅓ per cent ad valorem on ıshrooms, House bill 7456, paragraph 766, page 106. Our assoıtion is of the opinion that this high rate is proposed in conquence of the erroneous testimony of various fresh-mushroom owers before the Ways and Means Committee at the recent hearzs. not only as to the reasons why they have been unsuccessful in ırketing their product in tins, but also as to why the French canned ıshrooms have the preference with the chefs in the hotels, and o as to the conditions, costs, etc., of the packing of the French icle.

I have here the hearings on the general tariff revision before the mmittee on Ways and Means, and on page 1760 of Mr. Jacobs's timony—I presume, the gentleman who preceded me to-day—he ntioned something similar to what he told you about the disadıtage that they are up against on account of the bleaching of the ench mushrooms.

This gentleman evidently is not aware of the conditions. It is olutely impossible, and has been ever since the pure-food law has n in existence, to import any mushrooms into the United States t are bleached with sulphate of copper. I myself am an importer l also a manufacturer of mushrooms on the other side, and I have l 30 years' experience in the business.

He said the same thing as he told the gentlemen before the Ways l Means Committee. The importers are more likely to be picked on anything of that kind than the domestic manufacturers would if we were to attempt it, because our goods come through the erent ports, and the Bureau of Chemistry have offices in every of the appraisers' stores. They have quite a staff in New York r, where most of these mushrooms come in.

Senator Dillingham. Is that true down to the time that our pure-d law was adopted?

Mr. O'HARA. Before the pure-food law there was a pinch of sul-phur put into bleached mushrooms, but we have found that it is unnecessary to bleach them. The Frenchmen have a little secret of their own which meets with the approval of the Agricultural Department here, and there is no such thing as bleaching them any more. We sell just as many without bleaching them as we used to before the pure-food law went into effect.

I am glad that Mr. Jacobs is still in the room, as I want to say here now that his statement is absolutely unfounded. I do not think he makes the statement maliciously, but he evidently is not posted. The Bureau of Chemistry takes samples out of the different shipments, and they know if there is such a thing going on. If there were, we would have to reexport the goods. There is nothing of the kind taking place. The domestic manufacturer might "get away with it," to use a slang expression, because there is nothing to stop him except that he might be picked up in interstate commerce.

Mr. Jacobs said something about the chefs, in his statement before the Ways and Means Committee, preferring these canned mushrooms. The truth is that there is business for fresh mushrooms and business for canned mushrooms. Those who prefer the canned mushrooms prefer them because of the economy. They can open up a tin of mushrooms, if some one drives up to the hotel and asks for steak and mushrooms, and there is no waste. If they were to buy several baskets of fresh mushrooms and did not use them there would be a loss. There are some road houses who make a specialty of chicken and mushrooms, and those places would probably prefer the fresh mushrooms, because they would use a great many of them.

I have talked with hotel chefs, and I find that some prefer the fresh mushrooms, and some prefer the canned because of the economy.

In the argument of Mr. Gross before the Ways and Means Committee, page 176 of these hearings, he spoke of the cost and compared the cost of labor in the United States as against what the French p... In the meantime I wrote over to the other side and received comp... information.

It is true that the American labor is higher. Mr. Gross said ... the Americans pay from \$4 to \$5 a day, and in his testimony he ... that the French labor received from 60 to 75 cents a day.

The actual price that the French laborers are paid is 2½ francs ... hour, say, 20 cents on exchange of eight. That is normal, or, ... it is about what the exchange has been for some little time ... That is \$2 a day of 10 hours. The chief workman, who has to ... something about the qualities of mushrooms, etc., receives ... francs per week, or \$20 per week.

Another one of the arguments used with reference to mushr... was the question of labor and the question of manure and the que... of coal. As far as coal is concerned, you heard Mr. Jacobs say ... they had a high price to pay for coal. What do you imagine ... price of coal must be in France? It has been considerably hi... sometimes four and five times as high as we have to pay for ... which is sent into Pennsylvania, Mr. Jacobs's own State, right ... near-by mines. In France it is a question of receiving it princi... from England. The coal there is considerably higher than ours.

Mr. Jacobs or Mr. Gross testified—or, I believe, it was a Mr. E... either one of those three gentlemen who spoke on mushrooms—...

merican manure was $2.80 a ton, and that the freight was $3.50, aking a total of $6.30 delivered at their factories.

They went on to say that in France, in the cities of Paris and ordeaux, there are caves that have been quarried out for centuries, id that those caves are used for the production of mushrooms. iat is absolutely a myth. There is no such thing. In the catambs of France never have mushrooms been raised.

They went on to say, further, that in regard to this manure it was livered to the factories in France by simply pushing up a chute in e street and dumping the manure down into the catacombs and ves in the streets of Paris and Bordeaux.

I am telling you what is in these hearings. The fact is that that is solutely not the case. I have been there many times myself and know the situation. The mushrooms in Bordeaux are carted in igons and come by freight. In Paris there are some quarries outle the city where mushrooms are raised, but the people who own ose quarries exact the payment of a rental; so that there is nothing e about it.

In the testimony of one of these gentlemen it was said that their st of mushrooms was 44 cents a pound, whereas in France, they id. they were raised for 15 cents a pound.

They are not right in that figure. I do not want to make any sstatement, so I have had the information from the other side. ie information is that there are different grades of mushrooms. iat is why these prices vary. They cost there from 5 to 9 francs, the rate of exchange of 8—40 to 75 cents. So we have mushoms at practically the same figures as they have on the other side. e have cheaper labor over there. They pay a little bit more for eir manure. Their price delivered would be $6.30. Our price livered over there is $10.28. This manure has to be taken out the big cities of France, such as Paris and Bordeaux, just as it is ien out of the big cities of Philadelphia or New York. Our labor about half; our manure cost is more. The original cost is about same, but we are handicapped because we have the freight, when comes from the Tours section of France, down to the seaport, and have the freight from Bordeaux and Havre to New York City. at is the principal port. These gentlemen have been getting a e of 33⅓ per cent. We have always had a specific rate on mushims, and I was glad to hear Mr. Hupfel say that he would be isfied, because I am hoping that you gentlemen will give us a cific rate, even though we are willing that it shall be higher than s at present.

It present mushrooms pay 2½ cents a pound duty under the derwood bill, and it has been the same under the Payne-Aldrich l, but that 2½ cents a pound duty is not only on the weight of the shrooms, but on the weight of the tin and the immersing fluid l the container, and as 100 of these tins weigh about 114 pounds, duty per case has been $2.85. As each tin contains 8 ounces of ined mushrooms, this amounts to about 5.7 cents per pound on drained mushrooms.

They claim that they were not imported during the war. They come over all through the war. These gentlemen made a mistement. Probably they did not know it, but we imported mushims continuously during the war. There was no difficulty in nging them in.

Our association is particularly desirous that mushrooms shall b continued at a specific rate of duty, as we know that it would be very difficult matter to appraise the values if this article were asses at ad valorem rates. Our association has had experience w sardines, since this latter article was placed on the ad valorem list, b being continuously before the board of appraisers, settling disput about values—a lengthy and costly proceeding. As most pack of mushrooms have their own ideas of grading, we can see noth but trouble ahead for our members, the examiners, and for t appraisers at the different ports, as no two grades would be al Hence we recommend that a specific tariff of 4 cents per poun including the weight of the contents and the container, be appli This would mean a duty of $4.56 per case of 100 half-kilo tins, wh is the size of the package ordinarily imported from Farnce; and a the present tariff of 2½ cents per pound figures $2.85 per case. increase in duty we propose amounts to 60 per cent advance over t present as well as over the Payne-Aldrich tariff.

It is our honest opinion that 4 cents per pound on the weigh the mushrooms, the immersing fluid and the cans themselves— equivalent of 9.1 cent per pound on the drained mushrooms—is t maximum that these goods can stand, and that any higher r would so curtail the importation that the object sought, to prov revenue, would be lost.

Furthermore, while there is a domestic industry in fresh mu rooms that requires a certain amount of protection, we can furn an abundance of evidence to the effect that the experiment of pa ing domestic canned mushrooms during the war, made on a sm scale, was very unsatisfactory, and buyers who purchased a sam shipment declare they will not continue handling these dome canned mushrooms on account of the poor quality, and not cost.

The houses that gave me that information are the very hou whose names were used by the gentlemen in their arguments be the Ways and Means Committee.

I thank you for the attention you have given me, and I hav letter here which I would like to submit if it is agreeable to yo

Senator McCUMBER. It will be made a part of your testim and printed as such.

(The letter referred to is as follows:)

AUGUST 30,

In the matter of sardines, our association respectfully requests that the assessed at specific rates, similar to the method followed in the Dingley and Aldrich bills. The tariff obtained from this method would be approximat same as would be obtained by the proposed 26 per cent duty in House bill

The object in asking for the so-called Dingley rates is to avoid continual tion before the United States Board of Appraisers concerning the correct v sardines.

Members of our association and the association itself are frequently in li before the United States Board of Appraisers, and it is safe to say that in jority of cases importers of sardines have been paying duty on a higher va than was justified in order to escape being penalized for undervaluation.

Respectfully submitted.

ASSOCIATED IMPORTERS OF FOOD PROD
GEORGE O'HARA, *President.*

(Permission was previously granted by the chairman to file the llowing as a part of the witness's testimony:)

PARIS, JUNE 20.

NISTRY OF COMMERCE, *Paris*.

SIR: The United States Government is at present studying a general reform of eir customs tariff and the American suppliers are taking drastic steps with the blic authorities with respect to commodities in which every party is interested, order to increase the customs duty in such a proportion that the importation of oducts of foreign origin be impossible.

We thus learn that growers of North American mushrooms are suggesting that the esent duty of 2½ cents per pound on preserved mushrooms be increased to 50 cents.

But the growers acknowledge that cost of production for cultivated mushrooms the States is about 44 cents per pound, i. e., that duty on same would be superior the cost price of the American mushroom.

If it is taken into consideration that French mushrooms are always exported to the ates as tinned goods, duty on which is calculated on the gross weight (1 pound containing only 230 grams net of mushrooms) one can realize that American ppliers wish a duty equivalent to more than double the cost price of the American oduct, to be applied on our preserved mushrooms.

In order to justify a protective exorbitant duty, American growers first mention gienic reasons and furthermore pretend that the production of mushrooms we are porting cost very little indeed.

Purposely mistaking dry mushrooms with tinned mushrooms, they pretend that nong the latter wild mushrooms can be found, these being picked by people who are able to distinguish the right kind, and often they are found to be poisonous.

They further state that our mushrooms are bleached with chemicals, the use of which prohibited in the States.

But the tinned mushrooms which have for many years been exported from France the States in large quantities are entirely cultivated mushrooms.

They being grown in quarries, they are well known and entirely free of injurious fects.

On arrival in the States, our preserves have to be tested by chemists at the Bureau of griculture, and if they are not in accordance with American regulations, their adission into the States is immediately prohibited.

In order to prove that tinned mushrooms are really cheap, American growers pretend e renting charge for disused quarries where they are cultivated is almost insignifint, and that Parisian catacombs are specially used, as manure can be thrown through imneys without expense, the workmen on the mushroom beds only getting 6 cents r hour, viz, 72 centimes in French money.

But the growing of mushrooms being an important agricultural industry, the old aster quarries convenient for the above-mentioned purpose are hired at very high ices, which vary between 0.75 franc and 1 franc per square meter in the Parisian gion.

In the Paris catacombs no mushrooms have as yet been grown nor manure been rown.

Horse manure, which is very hard to get, costs at present about 25 to 30 francs per n, in railroad station, and the cost of carriage is 9.85 francs per 100 kilos.

The workmen on mushroom beds are paid 2 francs and 2.50 francs per hour, chief orkmen getting from 230 francs to 250 francs per week.

Cultivated mushrooms are sent to the States in white tins weighing gross O. K. 500, e., a little more than the English pound, the price of which varying between 2.50 ancs and 4.50 francs, according to quality.

But these tins contain 230 grams of mushrooms, i. e., the English pound of French ushrooms is sold in France from 5 to 9 francs, namely, 41 to 75 cents, at the rate of francs to the dollar.

If carriage charges are added, plus cost of duty, 2½ cents per pound gross, viz, 5 cents r pound of mushrooms net and incidentals, French mushrooms in the States become ore expensive than American mushrooms.

The American growers are therefore trying to stop the importation of the foreign ticle so as to realize big profits prejudicial to the American population.

The culture of mushroom beds is a French industry of importance and the preservaon of same occupies on a big scale the factories in Paris, Bordeaux, La Touraine; it estimated that two-thirds of mushrooms preserved in France are sent to the States.

Summing up, the application of a prohibitive duty by the North American Government on our mushrooms would be very detrimental to agriculture and French industry, and we sincerely trust that the needful will be done so that our embassy and commercial attaché in Washington be without delay in possession of all necessary documents with a view to enable them to reveal the exact situation to the American public authorities and thus avoid the previous mentioned exorbitant duty. We are, sir,

Your very obedient servant,

CHAMBRE SYNDICALE DES FABRICANTS DE CONSERVES ALIMENTAIRES.

ONIONS.

[Paragraph 768.]

STATEMENT OF J. B. STAMBAUGH, REPRESENTING THE NATIONAL ONION ASSOCIATION.

Mr. STAMBAUGH. My name is J. B. Stambaugh. I represent the National Onion Association, and I will take but very little of your time.

One thing we contend is that the present tariff rate is not equal to the difference of cost of producing in foreign countries and the cost of transportation to this country to our Atlantic seaport towns. I want to draw your attention to the fact that the United States can grow all the onions and is now growing more than are consumed in the United States, so we don't need any protection. Further, I want to call your attention to the fact that it is almost entirely a labor proposition. From the time we produce the seed, and we do produce our own seed, it is a labor proposition. I am an onion grower myself, by the way, gentlemen. We produce our own seed and sow these seeds largely by hand. Those rows are planted from 1 to 3 or 4 inches apart, making it necessary to cultivate by hand. The weeding is done by hand, the pulling is done by hand, and the topping is done by hand, although there are machines that will top onions.

Senator SMOOT. Do you think you ought to have more than cents a hundred?

Mr. STAMBAUGH. Yes.

Senator SMOOT. What do you think you ought to have?

Mr. STAMBAUGH. We would like to have $1.50.

Senator SMOOT. What are you asking for? Not what you would like to have, but what do you want?

Mr. STAMBAUGH. A dollar and a half would give us but very little advantage. Seventy-five cents would give Europe 61 cents per hundred advantage over America.

Senator MCCUMBER. Do you raise more in the United States than are used in the United States?

Mr. STAMBAUGH. Yes, sir.

Senator MCCUMBER. Therefore, we are exporting large quantities.

Mr. STAMBAUGH. Yes, sir; we export to Porto Rico and Cuba and South America and Canada. Canada is not a large onion-producing country. I ship a good many to Canada, although the exchange has been against us the last couple of years.

Senator MCCUMBER. Where are our importations mainly from?

Mr. STAMBAUGH. Our importations are mainly from Spain, Egypt, the Bermuda Islands, Canary Islands, and Australia. Continental Europe ships some, but Spain produces about 2,000,000 barrels for export, and Egypt produces large quantities for export.

Senator SMOOT. Do you sell your onions that you export for more r less money than you sell in this country?

Mr. STAMBAUGH. We don't sell those direct. While I am a shipper, never sold any to a foreign country, only to Canada.

Senator McCUMBER. Where do you raise your onions?

Mr. STAMBAUGH. We raise in Ohio. Would it be of interest to ou to know where those onions are grown in the United States?

Senator McCUMBER. We know, generally.

Mr. STAMBAUGH. It will only take a little bit

Senator SMOOT. You are not interested in garlic, 2 cents a pound?

Mr. STAMBAUGH. We feel as though we should have as much proection as the garlic grower. We have felt that for years. When ou speak of onions you always create a laugh, and we have always een the fellow that laughed. It is really the Egyptian and European nion grower that had the laugh.

Senator LA FOLLETTE. Do you produce in this country the same rt of onion you get from Bermuda?

Mr. STAMBAUGH. We grow the Texas-Bermuda onion, and we grow nions of that kind in Louisiana and Florida. Those are southernown onions.

Senator LA FOLLETTE. Does it command the same price on the arket as the Bermuda onion?

Mr. STAMBAUGH. It is grown from the same seed.

Senator LA FOLLETTE. Does it command the same price? Is it the same quality?

Mr. STAMBAUGH. It is owing to the soil and climatic conditions. gypt has been able to import a larger Bermuda onion than Texas Louisiana or Florida have been able to produce, but they are om the same seed. The Spanish onions are very much like those the Pacific slope. Take California for illustration, Idaho, Utah, regon, and Washington. They grow a type out there that is really rger than any we can grow.

Senator McCUMBER. They are very mild.

Mr. STAMBAUGH. Yes, sir. Spain grows one that is tougher in xture than the American onion. They are put on our market and nsumed.

Senator McCUMBER. Will you explain why, if we are exporting ge quantities, a tariff would be any good to us.

Mr. STAMBAUGH. I am glad you asked that question. In 1916 we d a failure in the United States in onions, and they went very gh. It is during those years that we produce at a loss that we ed protection. We don't want you to put that on to give us an vantage over European countries to any extent, but when we oduce onions at a loss, as we did last year, that is when we need otection. And right here, while that is not in line with my talk, produced 140 cars of onions last year, and I lost on every car.

Senator SMOOT. How many did you dump?

Mr. STAMBAUGH. I did worse than that. I shipped my surplus o cold storage and they didn't pay freight, transportation, and rage charges.

Senator SMOOT. That often happens to fruit dealers.

Mr. STAMBAUGH. So I did worse. Most of the people had more se than I had and dumped theirs.

Senator Smoot. Let them rot?

Mr. Stambaugh. Let them rot at home.

Senator McCumber. Did you export any last year?

Mr. Stambaugh. Oh, yes; we gave them away.

Senator Dillingham. Was there no sale for onions last year?

Mr. Stambaugh. Yes.

Senator Dillingham. What was the matter?

Mr. Stambaugh. There were too many of them.

Senator La Follette. How were your prices last year as compared with the year before?

Mr. Stambaugh. I bought a lot at 40 cents a hundred. I shipped 300 cars and made about $8 per car net profit on them. So there were no excess profits. I bought them at 80 cents a hundred that cost $1.40 to produce.

Senator Smoot. Did you sell at 40 cents per hundred?

Mr. Stambaugh. No; I sold at 60 cents in a 14-cent bag. I furnished the bag and paid 40 cents for the onions.

Senator Smoot. Those were the onions we paid 20 cents apiece for?

Mr. Stambaugh. I suppose so. You are getting my talk very much confused. You may argue what the increase would cost the consumer. In Cleveland last fall I asked the price of onions and they said 8 cents. I went home and quoted them at 1½.

Have I answered your question to your satisfaction, why we import onions when we are asking for a tariff?

Senator McCumber. Did we export onions last year?

Mr. Stambaugh. No, sir.

Senator McCumber. And it is those years when there is a deficit that you need protection?

Mr. Stambaugh. Yes.

Senator McCumber. And you must have protection in those years in order to even up your losses in other years?

Mr. Stambaugh. Yes. I don't think we need any protection this year. This has been an excessively hot summer. We have raised heavy onion crops during dry seasons, but we don't raise heavy onion crops during dry seasons and hot seasons. Consequently, the United States this year harvested one of the biggest crops of onions they have harvested for years, since we have had a record. They would naturally sell higher, unless conditions are too much against us.

Senator McCumber. And if last year we paid 20 cents apiece for them we will probably pay 40 this year?

Mr. Stambaugh. It has been my experience from what information I could gain that there never is very much difference in the retail price of onions. We have lost money on them, and we would walk up to a stand and ask the price of onions, and they would tell you [illegible] cents, and we were getting them at 40 cents a hundred and shipping them all over the United States, and onions generally were about [illegible] cents per pound retail. They did seem to get down to a 6-cent basis.

Senator Smoot. I never heard of it.

Senator McCumber. They did not in this city.

Mr. Stambaugh. I presume not. To-day onions in our section are bringing 3 cents a pound, but there is a wonderful shortage. In our section in Hardin County we raised 3,700 cars, and I estimate this year about 1,200. Last year there were about 37,000 cars.

he United States, and I estimate this year about 18,000. If every ear was like that, I would not be here; but that is not the case.

Senator JONES. May I ask you a question? The chairman suggested a while ago that you want this tariff in the years when you ad a light crop?

Mr. STAMBAUGH. No; when we have a heavy crop.

Senator JONES. I think that is where you did not understand the hairman.

Mr. STAMBAUGH. Possibly not.

Senator JONES. I think the chairman suggested that you did want he tariff when you had a short crop, so that you could raise your price nd get what you call a fair return for your onions in that kind of a ear, but when you have a large crop and are able to export onions, ou were not needing a tariff. That, I understood, to be the position f the chairman.

Mr. STAMBAUGH. Yes. Pardon me. I didn't understand him.

Senator JONES. I understood you to say that in this year when ou had a short crop you would need a tariff. Is that right?

Mr. STAMBAUGH. No. Well, yes; I mean that. We have such a ort crop in the United States that by taking into consideration e rights of the consumer, those onions from Europe coming over, would be absolutely selfish for us to ask a tariff that would bar ose people from shipping them in when they are needed. But last ear, a year like last year, I never paid over a cent and a quarter a ound, and conditions got worse and worse until we finally bought em for 40 cents a hundred. That is the year they increased their roduct 1,032,000 bushels, when us fellows were going bankrupt. ad we had proper protection, we possibly could have delivered all of e production of the United States to the consumer; but as it was we ssibly dumped 2,000,000 bushels, and they imported 1,700,000 ishels.

Senator McCUMBER. I confess I do not understand your philosophy. ou say you do not need any protection when you have a short crop, id when you have a better crop and you are exporting it will not you any good.

Mr. STAMBAUGH. Yes; it does do good.

Senator McCUMBER. What time is it you are going to need pro-tion?

Mr. STAMBAUGH. I guess we don't understand each other.

Senator LA FOLLETTE. The protection gives them that market.

Senator McCUMBER. If they are exporting, our price is fixed by port demands.

Senator LA FOLLETTE. They export their surplus.

Mr. STAMBAUGH. The United States will consume just about 25,000 rs per year. If we produce 18,000 cars per year, we need some of ose onions. The tariff should not be so high but what we can ing them in. But, for illustration, last year we grew 32,000 cars onions to feed a population that needed 25,000 cars, and we had at surplus, and yet Europe came in and divided the trade with us.

Senator McCUMBER. If we have to sell abroad and do sell abroad, suming we get a better price by exporting than we get from the me demand, why did not the foreign trade ship to the same place shipped to instead of shipping to this country?

Mr. STAMBAUGH. I sold onions at 60 cents per hundred to go through New York City for export. I could reach that market in Cuba and South America with the onions that cost 60 cents per hundred plus the freight. I could not reach it had I paid $3 per hundred plus freight.

Senator SMOOT. Onions were so low last year that there were very few importations into this country.

Mr. STAMBAUGH. There were 1,770,000 bushels that came into the United States last year, according to our figures.

Senator DILLINGHAM. What is the freight from Spain to New York?

Mr. STAMBAUGH. What is the freight from Spain to New York? I thank you for that question. The freight from Spain to New York is 5 cents from the field to the vessel, and 38½ cents to New York City by water.

Senator DILLINGHAM. What is the freight from your section to New York?

Mr. STAMBAUGH. Our freight is 50½ per hundred. Spain has 12½ cents advantage of us on freight. Indiana pays about 60 cents per hundred. Idaho and Utah and that country pays over $1.

I have some figures here if you care to know something further about the cost. I want to offer this in evidence.

Senator McCUMBER. It will be printed.

Mr. STAMBAUGH. Here is a little paragraph that was gotten up by Mr. Rosenblum. I would like to offer that as evidence.

Senator McCUMBER. That will be printed. Is that about all?

Mr. STAMBAUGH. I just want to say one thing more. On the basis of 75 cents per hundred as the estimated cost of producing onions in the European countries and shipping them to seaport towns of the United States, and the estimated cost on the American western slope and in the Central States and Eastern States, the European countries will have 61 cents per hundred the advantage over the United States f. o. b. the ports at the Atlantic coast. We would like to have 1½ cents. That will give us an advantage, and it is a pretty hard proposition for us now.

BRIEF OF JOSEPH ROSENBLUM, SOUTH DEERFIELD, MASS., CHAIRMAN OF COMMITTEE OF NATIONAL ONION GROWERS' ASSOCIATION.

CHANGES RECOMMENDED.

I. This brief is submitted in connection with securing legislation under Sche[illegible] G, paragraph 208, which will protect the onion industry of the United States to [illegible] extent sufficient to equalize the difference in the cost of the production of the pro[illegible] in the United States and its cost of production in those countries from which [illegible] imported.

These briefs are a summary of the facts compiled by the various onion gro[illegible] appearing before this committee and by the various associations interested in [illegible] production and marketing of onions. The figures herein contained in so far as pos[illegible] have been taken from the Government reports and when those were not availa[illegible] from records kept by the various producers.

The present duty is 20 cents per bushel of 57 pounds. The change recomm[illegible] is a duty of 1¼ cents per pound.

The reason for the recommendation of such a change is that this amount w[illegible] fairly represent the difference between the cost of production in foreign count[illegible] and the average cost of production of onions in the United States. If such prot[illegible] is not given as will equalize those the inevitable result must be the continual in[illegible] in the volume of foreign importations and the corresponding decrease of produ[illegible] in the United States until the consumer will ultimately be at the mercy of the [illegible]

producer. To-day with the difference in the cost of production, with the rates of xchange in their unstable condition the proposition of growing onions in Spain and Egypt for the American market is attractive and is interesting capital, both here and ibroad. This country's producers are this year taking a loss of about 50 per cent of he actual outlay in the cost of production and are not going to continue to raise a roduct which they know will not return them the actual money invested. The lestruction of the onion industry in the United States besides rendering this country ntirely at the mercy of the foreign producers would cause a tremendous financial oss to hundreds of various farming communities in various sections of the country vhere the onion crop is the principal source of income of the farmers and its storing, narketing, and handling constitute practically the sole business of the community. 'he only way in which this can be averted is by legislation increasing the duty on hese imports.

DEVELOPMENT OF INDUSTRY.

II. The onion industry as shown in Title No. 1 affects 17 States directly in the natter of production and of course in the business of storing, distributing, and marketng effects many more. It is an industry where the capital invested in farms, storeouses, equipment, etc., equal approximately $55,507,500. It is an industry which onstitutes the principal means of livelihood of about 100,000 people directly and nany more indirectly. It is an industry which furnishes from 30,000 to 40,000 carads of shipping each year. Its development in the United States from the period om 1900 to 1920 is from 12,313 carloads to 37,051 carloads. In the Connecticut 'alley from the same period its growth was from 1,000 carloads to 3,600 carloads. n Texas from 20 carloads to 6,000 carloads. In California from 500 carloads to 7,033 arloads.

It is an industry in which the average yearly production more than equals the verage consumption.

III. In Title Nos. 1 and 2 are found the average production in the United States nce 1914. In Title 3 are found the average cost of production for the various proucing localities. These costs of production are obtained from taking from the inividual growers their figures of actual expenditures in producing the crop in the arious localities and averaging those figures. The information as to these freight ites was obtained direct from the carriers. The information as to the cost of storing nions as set forth in Title 5 was obtained from the owners of the storage warehouses nd from the producers.

The information as to the cost of production of the foreign product as shown in itle 8 was obtained from those people producing onions in those countries and the iipping rates quoted on the same title were obtained from the steamship companies.

No. 11.—*Contrast of domestic and foreign cost.*

1. Approximate cost of American product delivered at Atlantic seaboard:
   - Without profit .... [illegible]
   - With profit .... [illegible]
2. Approximate cost of foreign product delivered at Atlantic seaboard:
   - Without profit .... [illegible]
   - With profit .... [illegible]
3. Difference:
   - Without profit .... [illegible]
   - With profit .... [illegible]
4. Tariff requested 1½ cents per pound.

These figures show the actual cost to the American producer, figured over a pe[illegible] of three years, and include therein the actual storage costs, because as a part of the [illegible] of distribution about one-half of these onions have to be put into storage in orde[illegible] have them available to the consumer. In title 9 this question of profit does not ta[illegible] into account the difference in the rates of exchange between these various for[illegible] countries and the United States and which of course offer an added inducemen[illegible] the foreign producer to market his onions in the United States. So, consequ[illegible] the tariff asked for is simply the difference in the cost of production which the A[illegible] can producer can not change. He can not meet this emergency by decreasin[illegible] production, because he can not control the production abroad, which would in[illegible] as he decreased. His only remedy is to obtain a duty which shall protect him [illegible] extent of the actual cost of production against foreign competition.

CONCLUSION.

1. A return to the amount of duty imposed by the Payne-Aldrich bill would [illegible] afford sufficient protection to the onion industry at the present time because

(*a*) The cost of production in the United States has increased over 200 per c[illegible] over what it was when that bill was in effect, and the freight rates in the United St[illegible] have increased from 75 to 100 per cent in the same time, so that the duty impo[illegible] the Payne-Aldrich tariff on onions would not equalize the present difference in c[illegible] of production of that product here and abroad.

(*b*) A tariff of $1.50 per hundred pounds will not destroy competition, for when [illegible] market in the United States reaches our cost of production the importer can [illegible]

ffford to compete in the market with us. Such a tariff will really protect the American roducer in times of overproduction.

(c) A duty of 1½ cents per pound will prevent the development of the present onion ıdustry in Spain and Egypt by American capital, and under the present duty there every inducement to American capital to invest in the development of that industry.

(d) A duty of 1½ cents per pound would not absolutely prohibit importation and ı case the market in this country was higher than the cost of production here, its ffect would be no different from that of the Payne-Aldrich duty in 1912, when the nports from Egypt were larger than ever.

2. Our figures submitted in connection with the volume of imports under Title o. 7 are compiled on the basis of the calendar year and not the fiscal year. The eason that they do not show a steady increase during the period from 1914 to 1920 nder the low tariff rate is because from 1914 to 1918 the World War prevented the mareting of Egyptian onions in the United States and materially affected both the proucing and shipping in other onion-growing countries. The work of reorganizing and eveloping began again this present season, and its effect is being felt in our markets)-day in an importation greater than ever before.

3. We are submitting herewith sample cost of production sheets from the various tates in which the American product is grown, and on those sheets are found the aily wage paid in that locality for farm labor.

Average daily wage paid labor in the United States, $3.25 to $3.50.

Average daily wage paid in Spain for same work, 43 to 58 cents.

The daily wage paid in Egypt we are unable to ascertain exactly, but know that it ı less than that paid in Spain.

ADDITIONAL STATEMENT OF J. B. STAMBAUGH, REPRESENTING THE NATIONAL ONION ASSOCIATION.

Mr. STAMBAUGH. I was sent here originally by the National Onion Association. They have requested that I should come back here to show what the work of the emergency tariff bill has been in the last year since it was passed. I have here a few telegrams to which I should like to refer.

Senator McCUMBER. This is not covered in your previous testimony, is it?

Mr. STAMBAUGH. No; we did not have that information. I have simply two telegrams. One is from the Bureau of Markets and one from members in New York City.

I shall not take up a great deal of your time, but shall endeavor to go to the meat of this subject and show you what has taken place.

I would like to have the privilege of stating that in 1914, after the Underwood tariff bill went into effect with a duty of only 20 per cent, the importation of onions was only 1,800 cars. I want now to show you what has taken place during the time since the tariff bill has been passed and to show that the emergency tariff bill carries with it the same protection that the House bill does—75 cents per hundred.

We sent a wire to the Bureau of Markets. For some reason or other the Bureau of Markets has not compiled its reports up to date. They gave us the amount of onions that have been imported from the 1st day of July until the last day of October. I have a telegram here. We wired to Thurman-Page, of New York City, to give us the amount of onions that had been imported from July 1 to date. These are the chief telegrams I wish to treat with.

The total imports of onions from July to October, inclusive, were 725,642 packages. That would figure about 1,600 cars of 500 bushels to the car.

On the 9th day of December we received a telegram from Thurman-Page, New York City, reading as follows:

Spanish correct figures, 1,173,400 packages. Holland, Italy, Hungary, approximately 35,000 packages.

Mr. Chairman, those packages carried 120 pounds. Multiplying the number of packages by 120 pounds gives 2,900 cars of onions of 500 bushels each which have been imported into the United States during the period July 1 to December 9.

You will readily see that in 1914 our total imports were eighteen hundred and some odd cars as against 2,900 cars up to the 9th day of December. I want to impress upon your minds that we are just in the midst of the Spanish importation of onions. That will last for 100 days yet. In fact, I was down in New York City several years ago during the month of April and they were still coming in. In this report there are less than 100 packages of Egyptian onions. That shipment does not commence until February. I think that is true of the Canary Islands and Bermuda onions, so that you can see all these onions are yet coming. But from our experience in former years it looks as if we were going to have five or six thousand cars of foreign onions shipped into the United States.

In order to show the immensity of it, let me call your attention to the report of the national association as of December 1, which shows that there are 4,921 cars of onions in dry storage and 700 cars in cold storage, or approximately 4,600 cars of onions in the United States.

When you figure from July 1 to December 9, you find that there have been 2,900 cars of foreign onions that have come in here with no let up.

I wish to read this telegram to you:

Up to date considerable goods afloat to come forward.

Of course, there is no one who can look into the future and tell how many onions are going to be imported, but I do not think it possible to get away with less than 5,000 cars of onions into our markets.

Senator McCumber. That would be how many bushels?

Mr. Stambaugh. Five hundred bushels to the car, Senator. We figure that number to the car. If we have a telegram asking us for a car of onions and the amount is not specified, we load 500 bushels.

I am frank to say, gentlemen, that the National Onion Association is alarmed. You may think that this bill should be drawn on the basis of the Payne-Aldrich bill, but when the Payne-Aldrich bill was in vogue, the industry in Spain was not developed as it is to-day. I am speaking of Spain because it is the nation that is alarming us. These other nations are not alarming us. To show that that country was not developed at that time, let me say that all importations were only 1,800 cars into this country under a 20 per cent tariff. What developed that country's importations more than the tariff was the World War. When that came on we were getting a good market for the onions. We could not get bottoms, as you know, and it was an opportune time for Spain. It did greatly develop the onion business in Spain, that was unheard of at that time. We have got to take care of that condition now, or, rather, you have got to take care of us.

Senator McLean. What rate do you want?

Mr. Stambaugh. I thank you for that question. I should have stated that at first. I meant to do so. When I was here before the association told me to try to get $1.50 per hundred, or 1.50 cents

er pound. We realize, as an association, that possibly if you wanted) help us it would not be in your power to help to that extent, so ley instructed me to plead with you to give us 1 cent per pound.

Senator McCumber. How many pounds are there to the bushel?

Mr. Stambaugh. That is a question that would be better answered this way. The United States has no standard.

Senator McCumber. Aren't there so many pounds to the bushel?

Mr. Stambaugh. It varies in the different States. The weight is ced by the State. I think, for instance, New York has 57 pounds hile Ohio has 56. Two years ago there was a lawsuit that arose rough a misunderstanding in regard to the number of pounds.

Senator McLean. The average would be about 50 cents a bushel?

Mr. Stambaugh. It would be. You see, the 100-pound package is come in and it has become a popular package.

Senator McLean. Is there any difference in the quality of the merican onion and the imported onion?

Mr. Stambaugh. That is a broad question.

Senator McLean. They claim that the Spanish onions are the best ions that we have here for consumption; is that so?

Mr. Stambaugh. I would have to answer that in this way——

Senator McLean (continuing). And that they command a little etter price.

Mr. Stambaugh. I could say either yes or no. No; they do not mmand a better price all the time. Yes; part of the time.

Senator McCumber. Has your onion the same flavor and the same veetness as the Spanish onion?

Mr. Stambaugh. The Spanish onions are so nearly like ours that e Spanish onions are taken out of Spanish packages and put in merican packages and sold as domestic onions.

Senator McCumber. That does not answer the question. At ast, it does not answer what I had in mind. What I want to know this: If you take the Spanish onion, which is a very mild, sweet ion, and plant it in the United States, will you produce as good an ion as you secure from Spain, or will it be different when raised in fferent soil and in a different climate in the United States?

Mr. Stambaugh. I am afraid you are misinformed.

Senator McCumber. Possibly I am.

Mr. Stambaugh. When you speak of that mild, soft, sweet onion is the Egyptian onion or the Canary Islands onion or the Bermuda ion; it is not the Spanish onion.

Senator McCumber. I know that I buy the Spanish onions, which) much more mild than the Bermuda onion; that is to say, I only ow what I buy them for.

Mr. Stambaugh. Yes.

Senator McLean. The others are very brittle and firm and not ry sweet.

Mr. Stambaugh. That is the truth. I must say that I do not ow. I am not competent to answer further than I have heard said.

Senator McCumber. I assume that they come from Spain because ere are only certain seasons of the year when I can get them. They) out of the market at other times, while the Bermuda onion is in e market all the year round.

Mr. Stambaugh. Incidentally, the American onion is best for wing, because it has the best flavor. The Spanish onion is best

raw. They are put in American sacks and shipped out to the trade as American onions.

Senator McLEAN. I had assumed that the Spanish onion commanded higher prices.

Mr. STAMBAUGH. The price of the Spanish onion to-day, in New York City, is practically the same as that of the American onion. They come in three different layers. There is a box about so large [indicating]. You can get the large ones in four layers and fill that box. Then you get the medium size in five layers to fill the box. and the smallest ones will take six layers to fill the box.

Senator McLEAN. Where is the major portion of the American onion grown?

Mr. STAMBAUGH. That is a large question. If you will give me time to answer that, I shall try to do so.

Senator McLEAN. Don't they grow in the Southwest—in Texas?

Mr. STAMBAUGH. The Texas onion is a Bermuda onion. On account of climatic conditions or for some other reason, they do not grow as large as those grown in Egypt and the Bermuda Islands, but they have the same flavor. I understand that they get that seed from that country in which the Bermuda onion is grown. It is a mild onion. That feeds the people from the 1st of April to the latter part of July. Then Louisiana comes in with onions, followed by Florida, and finally Kentucky, Virginia, and Jersey. There are onions shipped from the United States every month in the year. As you go north, I think, the onion is stronger.

You asked me a question a moment ago. Possibly this would be of interest to you.

Senator McCUMBER. You are not going to duplicate anything?

Mr. STAMBAUGH. No. Here are the States and the acreage:

California, 7,200 acres; Washington, 350 acres; Oregon, 500 acres; Utah, 75 acres; Idaho, 300 acres; Colorado, 750 acres; Minnesota, 850 acres; Wisconsin, 990 acres; Iowa, 800 acres; Michigan, 1,100 acres; Illinois, 750 acres; Indiana, 3,550 acres; Ohio, 4,583 acres; New Jersey, 400 acres; Massachusetts, 4,400 acres; New York, 8,720 acres. I am not well posted as to the amount of acres planted in Louisiana, Florida, Kentucky, and Virginia.

This is in the onion section. I do not have the Texas figures, but we are told that they are planting about 10,000 acres now. They are being set out at this time.

I thank you, gentlemen, for this opportunity to appear before you again. I trust that you can give us that cent per pound, because we feel that we need it in order to perpetuate our business.

POTATO FLOUR.

[Paragraph 769.]

STATEMENT OF W. P. HARTMAN, REPRESENTING THE FAIR AMERICAN POTATO FLOUR CORPORATION, PITTSBURGH, PA.

Senator McCUMBER. You may state your name and address.

Mr. HARTMAN. My name is W. P. Hartman, representing the Fair American Potato Flour Corporation, Pittsburgh, Pa., and I wish to speak on the subject of potato flour, covered in paragraph 769.

Mr. Chairman and gentlemen of the committee, if you will permit, I shall file with you a brief and not read from it. It is very short

f you will further permit I will file along with it the published hear-ıgs on the bill introduced in June, 1919, asking for a tariff of 3 cents er pound on potato flour; and the published hearing of February 2 of this year before the Ways and Means Committee; also a pam-hlet published for the information of the Ways and Means Committee y the United States Tariff Commission entitled "Domestic Potato roducts Industry"; all of which contains considerable statistical nd other data that I will not burden you with at this time.

Senator McCumber. You are asking this to be printed as a part f your testimony?

Mr. Hartman. Submitted for reference.

Senator Smoot. What do you say you want on that flour?

Mr. Hartman. Three cents per pound.

Senator McCumber. The committee will have to be informed as to ıst what you want printed. You spoke about having some of the earings printed.

Mr. Hartman. The hearings and pamphlet for reference only.

Senator McCumber. You do not ask that they be printed?

Mr. Hartman. No, sir.

The Chairman. Very well. Your brief may be printed.

Mr. Hartman. There are four points, and I will not take more ıan five minutes in discussing them, if I may.

The bill allows a duty of a cent and a half per pound. We are sking for 3 cents, and say to you honestly and frankly that the otato flour manufacturers of this country can not exist under a duty f less than 3 cents per pound.

Senator La Follette. Why?

Mr. Hartman. It costs us 6 cents a pound to produce, and Euro-ean potato flour is produced by millions of pounds and delivered at ur ports at 3¼ and 3½ cents per pound.

The introduction of potato flour is a costly item. Every one of ur salesmen is a technical baker, and in almost every case where e introduce the product we have to make a demonstration in the ake shop to get it in. The basic price is 9 cents at the mill for our roduct. The importers are offering potato flour as low as 4 and 5 nts in New York and Philadelphia and other eastern markets. e introduce a quality product, and the importer comes along with is cheap and inferior European grade and undersells us.

Senator La Follette. Where does it come from?

Mr. Hartman. Mainly from Holland at this time; prior to the war ostly from Germany. We understand Germany is now offering me of it.

Senator Smoot. How long have you been making potato flour?

Mr. Hartman. The first mill was constructed in 1918.

Senator Smoot. Not the first mill in the United States?

Mr. Hartman. The first potato-flour mill; yes, sir. It is dis-nctly a product of the World War. The first potato-flour mill was nstructed in the year 1918 at Idaho Falls.

Senator La Follette. How much is produced now?

Mr. Hartman. Up to the present time there has been produced mething over 5,000,000 pounds. The Falk American Potato Flour orporation has five plants.

Senator La Follette. How much is being imported?

Mr. Hartman. There are no definite figures on importations. It as not separated in the imports prior to 1914, nor since that time.

I do not know exactly what the imports would be. They have a gre quantity of stock in Europe; a lot of stuff is offered over the There are more than 12 firms that we know of that are offering it the prices I have named.

Senator La Follette. What are they offering it at here?

Mr. Hartman. From 3¼ to 3½ cents c. i. f. New York. Dur the hearings before the Ways and Means Committee the point wa developed as to the increase in the cost of bread if potato flour is us I would like to say there would be no increased cost, because it used solely as a bread improver and used exclusively by the bak industry. We all know what mother's potato bread is. It is us in the proportion of 2 per cent, or about 4 pounds to the barrel wheat flour of 196 pounds.

Senator La Follette. What is its value in bread?

Mr. Hartman. It is a bread improver. It is a natural yea food. The use of it makes a better loaf of bread, better in taste better in flavor, better in keeping quality. The moisture retent is of great value to the baker and housewife.

Senator Smoot. You do not use the old way of putting it in?

Mr. Hartman. The baker can not use the old method because the new machinery of the present day. He can not mix mash potatoes with his dough. Our potato flour sifts in and unifies eas with his wheat flour.

There was another point developed in the hearings before th Ways and Means Committee, and that was upon the convers equivalent of the potato on the compensatory basis. The duty 1½ cents was fixed by the Ways and Means Committee on the bas of 42 cents per hundredweight on potatoes, and the production fact (as they were incorrectly advised) at 25 per cent, whereas the actu production factor is 20 per cent. I may say to you gentlemen th since the hearings we have shown to the satisfaction of members the Tariff Commission and certain members of the Ways and Mea Committee that it is actually 20 per cent, and we have been told b two members of the committee that if you gentlemen recomme and put in your bill a duty of 3 cents per pound that they will supp the measure, with their later understanding of the difference in co version equivalent. Basing it at 25 per cent, which was an incorr basis, they arrived at 1½ cents per pound. If the correct factor h been used, 20 per cent, it would figure 2.1 cents per pound.

Senator Smoot. Potatoes are very cheap in the United Stat Does it cost you any more to make potato flour than to make wh flour from wheat?

Mr. Hartman. I could not say about that, Senator. I am n informed as to wheat milling costs. We figure over a 5-year per to pay 60 cents a hundred for the potatoes.

Senator La Follette. That is the way you arrive at your co

Mr. Hartman. Yes, sir. We have to figure on that basis.

Senator Watson. Where is your competition?

Mr. Hartman. Holland and Germany—mainly Holland this y

Senator Watson. Do they raise potatoes cheaper than we do?

Mr. Hartman. Yes, sir; they raise and transport them cheaper

Senator Watson. How is that?

Mr. Hartman. The labor cost, transportation, subsidy, and t type of potatoes they grow. The European potatoes contain abou

r cent more starch than the average in the United States, because ey grow a selected variety for industrial purposes, unfit for ordinary e, for table use; whereas, we have to take our potatoes from the linary table stock. I want to point out the economic importance this industry, because we aim to use sound under United States ide No. 1 potatoes, permitting the No. 1 potatoes to go into the linary channels of trade. The capacity of the Falk Corporation ints ranges from one to three carloads a day. We have plants ated in Michigan, Wisconsin, Minnesota, Idaho, and Colorado. ere are two other plants owned by farmers' cooperative exchanges Colorado and Nebraska, one privately owned in Wyoming, and e in Maine, nine plants at the present time. These plants were t producing anywhere near capacity during the last season, when tatoes were dumped because of the lack of market, because they ild not go up against the foreign competition and the prices I have oted you of 3¼ and 3½ cents.

Senator La Follette. How much labor do you employ?

Mr. Hartman. The labor cost is relatively small. We employ 20 25 men to the plant. We aim to operate in normal seasons about ven months in the year. The other five we can not operate. We n to operate from October or November up to May and June, pending on the condition of the crop.

I have stressed the two points, one with reference to conversion uivalent and one with reference to not increasing the cost of the if of bread. The third is the economic importance of this industry the American potato growing industry. Take Michigan, for exam-. They produced 28,000,000 bushels of potatoes last year. The wspapers reported that there were 2,000 carloads dumped on ac-int of the lack of market. If our plant could have afforded to erate at Cadillac, Mich., continuously from the time they were idy on down they would have used somewhere around 650 carloads.

Senator La Follette. What is the transportation rate from over-is?

Mr. Hartman. From Rotterdam to New York or Philadelphia it 23 cents per hundredweight; from our nearest plant in Michigan New York it is 66 cents per hundredweight.

Senator Smoot. I notice you do not have very many imports of tato flour?

Mr. Hartman. No, the record does not show it was heavy. I nk in 1914 there were something over 500,000 pounds. We have int considerable money in developing a market. We have main-ned upward of 25 technical men demonstrating throughout the ited States, introducing the product. It came out of the war, gely at the solicitation of the various Federal departments. Con-ss appropriated $50,000 for dehydration investigational work, and Bureau of Chemistry found that production of potato flour was of the most promising of the various dehydrating features.

Senator Smoot. Only 438,000 pounds of dried potatoes and potato ur was brought into this country in 1918?

Mr. Hartman. Yes, sir. That was practically all potato flour.

Senator Smoot. There were only 550,000 pounds in 1914?

Mr. Hartman. Yes, sir. There are millions of pounds offered in rope to-day.

Senator LA FOLLETTE. Do you know the amount of money th Government appropriated, or, rather, when it made its last appro priation to promote this industry?

Mr. HARTMAN. The appropriation was made, I think, in 191 $50,000.

Senator LA FOLLETTE. I remember it in the appropriation bil but I do not remember when the last one was made, whether the are continuing the experiment.

Mr. HARTMAN. Yes; they are continuing the experimental wor

Senator SMOOT. There was only one appropriation.

Mr. HARTMAN. $50,000. That work is still being continued. I wanted to show you these samples to demonstrate to you the differ ence between starch and potato flour. The question was raised th there would be confusion in the customs officers. There is no chanc of confusion if a man will use his senses. They do not taste alike do not feel alike, do not smell alike, and do not look alike. That wa one reason, we understand, for putting the rate at 1½ cents a pound thus being the same as potato starch. I thank you very much. an I would like to file this brief as a part of my testimony.

Senator MCCUMBER. The brief will be printed.

BRIEF OF W. P. HARTMAN, REPRESENTING THE FALK AMERICAN POTATO FLOU CORPORATION, PITTSBURGH, PA.

The manufacture of potato flour in the United States is a distinct national as It is a product of the World War, resulting directly from the encouragement an solicitation of Federal, State, and other authorities. Congress, by its substan appropriation of funds for research, experimental, and promotional work in the mat of dehydration of vegetables and fruits, voiced a national sentiment favoring conservation and utilization of foodstuffs, particularly that tremendous volum farm products so often a total loss because of undergrade.

The records and exhibits of the Bureau of Chemistry, United States Departm Agriculture, will, I believe, among others, sustain the statement that the manufa of potato flour proved one of the most successful and most promising of the count and costly experiments conducted to determine methods and products that w survive as a permanent industry.

At the very outset it was known to everyone in any way interested that potato f could not be produced in this country in direct competition with the cheaply duced, inferior foreign product. It was naturally assumed, as the experiment gressed to commercial proportions, that a new industry of such character, when pr a commercial possibility, would instantly enlist the support of the Congress of United States, to the end that a duty on imports, sufficient to adequately pr domestic production, would follow in due course.

In pursuance of this theory a bill was introduced in Congress (H. R. 6814) Jun 1919, asking for a duty on imports of potato flour of 3 cents a pound. Published h ings on this bill before the Ways and Means Committee of the House of Represe tives contain sufficient data to prove the positive merits of the application. Sup menting the hearings, a pamphlet published at that time for the information Ways and Means Committee, by the United States Tariff Commission, ent "The Domestic Potato Products Industries," furnishes important statistics and specific information. With your permission and in order to save your time, we mit the two documents for your reference as a part of our testimony at this h

Further, as a part of this statement we refer to hearings on general tariff re before the Ways and Means Committee, House of Representatives, Part V, Sch N—Sundries and free list, pages 4017–4023.

Potato flour is a very distinct product, comparable in no way, either as to pro manufacture, appearance, odor, flavor, color, texture, or uses, to any other pr product. It is the whole potato minus only its water content and outer skin sound potatoes are used, which are washed, peeled slightly, thoroughly cooked and dried into flakes over large steam-heated drums, then ground and bolted into a creamy-yellow flour. Potato flour is used almost exclusively by the baking ind solely as a bread improver. Any experienced baker, chemist, or food author attest its merits.

Manufacturers of potato flour aim to harmonize the industry with pres standards of farm marketing of the potato crop so that the factory will absorb the

nder United States grade No. 1 stock. In seasons of overproduction the industry ught to be in position to work up the surplus crop, thus obviating the heavy complete oss to growers and shippers because of dumping and total waste such as obtained is year in Michigan, Maine, and other States.

There are nine factories equipped for manufacturing potato flour in the United ates. Five of these plants are owned and operated by the Falk American Potato lour Corporation, general offices, Pittsburgh, Pa. The factories are located at adillac, Mich.; Wisconsin Rapids, Wis.; Bemidji, Minn.; Idaho Falls, Idaho; d Monte Vista, Colo. Plants owned by farmers' cooperative associations or local mpanies are located in Maine, Wyoming, Nebraska, and Colorado. It will be noted at practically all of the principal potato-growing districts of the country are served a factory.

Owing to short crops, lack of protective tariff, and other causes, not one of any of e nine plants has been able to work to capacity during any of the years since the first ill was constructed in 1918. If a protective tariff had been in effect I can say to u positively that every one of the Falk plants would have operated continuously ring the winter and spring of 1920–21. I conclude the other companies would have en similarly situated.

On the basis of a five-year average—taking into account the seasons of short crops d consequent prohibitive prices for potatoes for manufacturing purposes, and other tors—we figure the average paying price for potatoes at 60 cents a hundredweight. e extraction in manufacturing is 20 per cent potato flour—and not 25 per cent, as e Ways and Means Committee was incorrectly informed during the course of its estigations.

Thus the flour produced, allowing for shrinkage and waste, costs 3.1 cents per und for the raw product alone. Figuring all items—raw product, labor, supplies, erest, depreciation, idle time of plant, etc.—the cost is 6 cents a pound to produce d bag the flour ready for shipment.

Very heavy constant expenditures are required to maintain the necessary advering, demonstrating, and other sales costs to introduce and develop the markets. uropean potato flour, of which there are large quantities available, is offered to-day 3.5 cents per pound c. i. f. New York.

The Falk American Potato Flour Corporation is capitalized at $1,000,000. More n its total capital stock is now actively invested in the industry. Owing to various ses, the net losses to the company to date have been exceedingly heavy. The er small companies have less capitalization, but all of them have suffered losses.

The House of Representatives (H. R. 7456, Rept. No. 248, par. 769) voted a duty potato flour of 1¼ cents per pound. The potato-flour industry of this country will ish absolutely under this nonprotective measure. Nothing less than 3 cents per nd will afford the required protection. In the same paragraph dried potatoes are tected under proposed duty of 3¼ cents. The Ways and Means Committee arrived 1¼ cents per pound on potato flour, basis conversion equivalent, potatoes at 42 ts per hundredweight, extraction of potato flour 25 per cent.

We have since proved to the satisfaction, at least of some of the members of the mittee, that they were incorrectly informed and that the actual factory produc- factor is 20 per cent. With the corrected figure, the compensatory duty would 1 cents. However, we maintain, and we are supported in our position by tariff lorities, that there need not necessarily be the close relation, based upon conversion ivalents, that obtains in the case of raw materials and derivatives such as flaxseed l linseed oil, or wool and textiles. Potato flour and potato starch are two entirely erent articles of commerce in every particular. There is no good reason why the should be confused in any essential.

tariff of 3 cents a pound on potato flour will insure the life of the industry; less n that amount means its immediate ruin. The relationship of this industry to erican agriculture is of first importance. Potato growers' associations and shippers various States, also some State legislatures, have petitioned you by resolutions ing your favorable consideration for a duty of 3 cents.

TOMATOES.

[Paragraph 770.]

ATEMENT OF FRANK J. BARRY, REPRESENTING NOGALES (ARIZ.) CHAMBER OF COMMERCE.

Mr. Barry. Mr. Chairman and gentlemen, I am appearing as the resentative of the Nogales (Ariz.) Chamber of Commerce. The son that the Nogales Chamber of Commerce is interested in the

Senator SMOOT. It does not make any difference when they c... over when they are sold or canned for future use.

Mr. BARRY. I know they do not can in Nogales. I am speaking of the whole consumption. They do not can any of these tomatoes. They are sold on the market, distributed in the natural state and sold to the retailer in the natural state. It would be impossible to can tomatoes at a cost so great as these tomatoes bring on the market.

Senator MCCUMBER. But do you meet any competition that would result if we put them on the free list from other sections of the country?

Senator SMOOT (interposing). This does not apply to winter tomatoes. This applies to tomatoes of every kind.

Mr. BARRY. I know it does, and I distinguish in this argument ... will follow between them and your summer tomatoes. We do not ... the "summer tomato"; we propose that provision be put in section 770.

Senator SMOOT. You have not stated that.

Senator MCCUMBER. That is, that in certain months they shall ... bear the same duty as those imported in other months; is that your claim?

Mr. BARRY. That is it, Senator.

Senator MCLEAN. You are in about the same fix as the potato men?

Mr. BARRY. I do not know anything about those potato men, Senator. Then, as I said, the Mexican crop does not enter into competition with Florida, California, or Texas. As a matter of fact, I have a number of letters from dealers in tomatoes in California, Texas, and in the Northwest urging that no increased tariff be put on Mexican tomatoes, and I think several Senators have been sent telegrams by their constituents and letters from those States along the same line.

As I stated before, only 4 per cent of this crop reaches the Atlantic coast States, which is the market for the Florida tomato, and I may say that the Florida crop is not sufficient to supply the demand of the Atlantic coast. There is no competition whatever, therefore, between these tomatoes and the tomatoes that are raised in the United States during that period.

Moreover, the cost of producing and marketing these tomatoes is so high that they never can compete with the American-grown tomato. This is due mainly to the fact that it being a perishable product will not reach the market in a condition to be salable if it is not packed right. These tomatoes have to be packed in a certain condition in order that they may reach the market. Therefore there are quite a number—probably one-half of the crop—that ... to be laid aside at the time of picking, because it will not pack and ship, and they have no canning facilities in Mexico. Therefore ... is a great loss to the grower, and his cost is, therefore, much increased.

Senator MCCUMBER. What is the particular kind of tomato raised there?

Mr. BARRY. They raise several kinds. It is the same sort ... American tomatoes.

Senator MCCUMBER. Will you give us the names of the different kinds raised?

Tomatoes on the west coast of Mexico reach the United States ring the months of December, January, February, March, April, d May.

There are no tomatoes grown in the United States, except possibly se that are grown in hothouses (and they do not amount to anyng), during the months of December, January, February, or March. April Florida produces tomatoes; next comes the Imperial Valley California, and after that comes Texas.

Senator SMOOT. Does Arizona raise any tomatoes?

Mr. BARRY. Not to speak of, not for any outside consumption I ow of. It does probably in the summer season, but not during ose months I have mentioned. These winter tomatoes have been owing in Mexico now for some few years, probably 10 years.

Senator WATSON. You are an importer?

Mr. BARRY. No, sir; I am a director of the Nogales Chamber of mmerce, and I am sent here by them.

Senator WATSON. And they want to get tomatoes in from Mexico, they?

Mr. BARRY. Yes, sir. It is to the interest of the community there, cause the money received from those tomatoes is spent mostly ere.

Senator McLEAN. Do you make them into paste?

Mr. BARRY. No; they are imported only in the natural state.

Senator SMOOT. You say you are a resident of Nogales?

Mr. BARRY. I am a resident of Nogales.

Senator McLEAN. Are those tomatoes sent East?

Mr. BARRY. They are sent to the Middle States; they do not come ast. The cost of transportation is so high and the distance so far r a perishable commodity of this kind that it is inadvisable to send em East.

Senator McLEAN. They come into this country in the months ien there is no competition?

Mr. BARRY. That is the claim, and that is when they do come in; ien competition might exist from Florida they never get into e Florida market, Florida being confined to the Atlantic Coast ates, and only 4 per cent of the Mexico product last year reached e Atlantic Coast States; and, as I will afterwards show, the cost of oduction is so high that they can not compete with the Florida natoes.

Senator McCUMBER. Are those tomatoes used for canning after ming into the United States?

Mr. BARRY. No; they are used for immediate consumption, for nter use only.

Senator McLEAN. What is the retail cost?

Mr. BARRY. About 25 cents per pound retail.

Senator SMOOT. How many tomatoes do you want to bring over?

Mr. BARRY. Our people—probably a carload would be sufficient for whole year locally.

Senator SMOOT. There are other sections of the country probably t fixed like you are, because you do not raise any, and they are sed right across the line. But there are people raising tomatoes in nerica and in competition with that foreign product.

Mr. BARRY. I beg your pardon; they do not raise them during the onths that I speak of.

Senator SMOOT. It does not make any difference when they come over when they are sold or canned for future use.

Mr. BARRY. I know they do not can in Nogales. I am speaking of the whole consumption. They do not can any of these tomatoes. They are sold on the market, distributed in the natural state, and sold to the retailer in the natural state. It would be impossible to can tomatoes at a cost so great as these tomatoes bring on the market.

Senator MCCUMBER. But do you meet any competition that would result if we put them on the free list from other sections of the country?

Senator SMOOT (interposing). This does not apply to winter tomatoes. This applies to tomatoes of every kind.

Mr. BARRY. I know it does, and I distinguish in this argument that will follow between them and your summer tomatoes. We do not say the "summer tomato"; we propose that provision be put in section 770.

Senator SMOOT. You have not stated that.

Senator MCCUMBER. That is, that in certain months they shall not bear the same duty as those imported in other months; is that your claim?

Mr. BARRY. That is it, Senator.

Senator MCLEAN. You are in about the same fix as the potato men?

Mr. BARRY. I do not know anything about those potato men, Senator. Then, as I said, the Mexican crop does not enter into competition with Florida, California, or Texas. As a matter of fact, I have a number of letters from dealers in tomatoes in California, in Texas, and in the Northwest urging that no increased tariff be put on Mexican tomatoes, and I think several Senators have been sent telegrams by their constituents and letters from those States along the same line.

As I stated before, only 4 per cent of this crop reaches the Atlantic coast States, which is the market for the Florida tomato, and I may say that the Florida crop is not sufficient to supply the demand of the Atlantic coast. There is no competition whatever, therefore, between these tomatoes and the tomatoes that are raised in the United States during that period.

Moreover, the cost of producing and marketing these tomatoes is so high that they never can compete with the American-grown tomato. This is due mainly to the fact that it being a perishable product will not reach the market in a condition to be salable if it is not packed right. These tomatoes have to be packed in a certain condition in order that they may reach the market. Therefore there are quite a number—probably one-half of the crop—that has to be laid aside at the time of picking, because it will not pack and ship, and they have no canning facilities in Mexico. Therefore, there is a great loss to the grower, and his cost is, therefore, much increased.

Senator MCCUMBER. What is the particular kind of tomato raised there?

Mr. BARRY. They raise several kinds. It is the same sort of American tomatoes.

Senator MCCUMBER. Will you give us the names of the different kinds raised?

Mr. BARRY. I could not, but I think they have the popular kinds ɪed in the United States. I have heard them talk about Yellow lobe and a few of those other kinds.

Senator McLAIN. You say they retail at 30 or 40 cents?

Mr. BARRY. I understand they retail for about 25 cents.

Senator DILLINGHAM. Where, in the North or South?

Mr. BARRY. In the Mississippi States, many of them going to hicago.

Senator McCUMBER. Is that a very large tomato that is raised ɪere?

Mr. BARRY. No; it is not a large tomato. It is a medium-sized ɔmato, and hard. I can not say what they pay for them wholesale, nderstand.

Senator DILLINGHAM. At what price do they come into this ɔuntry?

Mr. BARRY. In Chicago?

Senator DILLINGHAM. I mean where they are imported.

Mr. BARRY. There is no market there for them.

Senator DILLINGHAM. They have to be bought there, do they not, y somebody?

Mr. BARRY. When they buy them there they probably pay 15 ents a pound.

Senator DILLINGHAM. Are they shipped directly from Mexico to he Northern States?

Mr. BARRY. Yes, sir; they are shipped from the point of origin.

Senator DILLINGHAM. What is the wholesale price when they are hipped?

Mr. BARRY. When they are shipped it is about 8 or 9 cents a ound, at the market, in carload lots.

Senator McLEAN. And the wholesaler gets about 15 or 20 cents in hicago?

Mr. BARRY. I suppose so; I do not know. I am informed that it ɔsts about 25 cents a pound to the final consumer. In addition to ɪese packing costs they have high transportation charges, of course, ɔming from all the way down in Mexico. They have about 800 or 00 miles haul below the border, coming up from to Chicago, going p to the Northwest and to Washington State, and coming to Kansas ity and to those other points where the consumption takes place.

Therefore, as a protective measure there is no necessity whatever r a tariff on Mexican-grown tomatoes that do not come in competion with our native product; and the cost of production is so high ɪat the native product can drive them off the market.

The only other reason, therefore, for increasing the tariff on these ɔmatoes would be to increase our revenue, and that, of course, is ɪ important matter to be considered.

During the last Mexican tomato season there were imported into e United States 24,272,000 pounds of tomatoes. That is the cord that the Nogales Chamber of Commerce has, and the consul Mazatlan states that the amount imported was 21,455,000. So e are practically agreed. Possibly some of these tomatoes came om Sonora and not from Mazatlan, where this consul is. There is ɪly a difference of less than 1,000,000 pounds in their reports.

On that importation the Government of the United States received ɪder the present rate of duty, $91,020 in duties.

INCREASE OF TARIFF ON MEXICAN TOMATOES WILL REDUCE RATHER THAN INCREASE REVENUE.

The only other reason for increasing the tariff on Mexican tomatoes would be to increase the revenue. During the last Mexican tomato season there were imported to the United States from Mexico 24,272,000 pounds of tomatoes on which the United States collected $91,020 in duties. One of the largest and most economically operated tomato farms in Mexico is "La Louisiana," at Los Mochis, Sinaloa, owned by Americans, and comprising 610 acres. The following is a table of the production and marketing costs for said farm for the last season:

	Per pound.
Cost of growing, including rent, interest, seed, labor, etc	$0.0[illegible]
Cost of packing materials and labor of packing	.01[illegible]
Cost of transportation, duties, and commissions	.03[illegible]
Total cost	.0[illegible]
Gross selling price	.0[illegible]
Net profit to grower	.00[illegible]

It will be seen that the grower's profit is less than one-half a cent per pound without taking into the calculation interest on his investment or bad seasons.

Now, if we add to the already high cost an additional five-eighths of a cent per pound, as is proposed, we find this entire net profit converted into a net loss of $0.0017[illegible], or nearly one-fifth of a cent per pound. The inevitable result will be the abandonment of the industry on the west coast of Mexico and the total loss to American consumers of a wholesome vegetable which has come to be a necessity of the winter table, as well as the loss to the United States of over $90,000 revenue.

It needs no further argument to show that as a revenue measure the proposed tariff would fail.

Can the selling price of tomatoes be increased so that the increased tariff may be passed along to the consumer? Possibly; but in such case the consumption would be greatly reduced, perhaps to less than one-fourth the present consumption. Experience teaches that when duties are passed on to the consumer they are many times multiplied on the way. Winter tomatoes at present cost the housewife about 25 cents per pound. Add five-eighths cent per pound to the present production cost and it is safe to say that the consumer will pay more than 30 cents per pound. Such a large increase in price may not kill the entire consumption but would be certain to kill three-fourths of it. What is the result? A net loss to the Government of over $30,000 per annum.

The importation of winter tomatoes should be encouraged rather than discouraged. Measures should be taken to reduce the price rather than increase it as long as no native industry suffers. The Government could well forego its tariff on such a desirable and necessary article of food during the winter season when fresh vegetables are unavailable. Certainly the importation should not be curtailed nor the price increased by an increase of duty. It is respectfully recommended, therefore, that winter tomatoes be placed on the free list or that the duty thereon be not to exceed three-eighths cent per pound.

The following proviso might be added to paragraph 770:

"*Provided*, That tomatoes imported in their natural state between the 15th day of December and the 15th day of May, annually, shall be admitted free of duty."

TOMATO PASTE.

[Paragraph 770.]

STATEMENT OF JOHN S. MITCHELL, WINDFALL, IND., REPRESENTING MANUFACTURERS OF TOMATO PASTE.

Senator McCUMBER. Please state your residence and occupation.

Mr. MITCHELL. I am from Windfall, Ind. I want to discuss for a short time a peculiar condition. I want to discuss with you the subject of tomato paste, and strange to say, at this time, asking for a protective tariff on tomato paste I shall be able to prove to you we will not increase the price of tomato paste but will decrease it.

To our Italian friend who discussed the subject this forenoon I want to present now the American side of the story. Tomato paste is the product of the familiar vegetable tomatoes, that is used, on the average, in our American families in some form at least two meals per day every day of the year. Strange to say, the form of tomato paste is not known to the average consumer, who does not live where tomatoes grow and who does not know whether it is a little pear-shaped tomato or a round one.

A few of us had the nerve during the war to manufacture American-made tomato paste and start at the beginning of the industry to produce the best quality that could be produced, and had the nerve to install the best machinery, believing that the time had come, because the war had barred out importations, that when the war ceased and the Italian nation began to send in here the tomato paste that they had heretofore the Congress of the United States would see fit to give us protection to the extent of the difference in labor. That is the only thing that we need.

Senator SMOOT. The bill gives 28 per cent ad valorem. What do you want?

Mr. MITCHELL. Forty-two per cent.

Senator WALSH. How large an output have you?

Mr. MITCHELL. During the year 1918 we produced 2,000,000 tins of that brand [indicating].

Senator WALSH. What was the value of that two million?

Mr. MITCHELL. At that time it was $20 per case of 200 tins.

Senator WALSH. How many employees did you have?

Mr. MITCHELL. About 150.

Senator WALSH. You have heard what the Italian gentleman said about what it cost to produce?

Mr. MITCHELL. That is right; yes, sir. This concentration is costing us to-day $10 per case, or 5 cents per tin, and contains exactly the same food value of that 2-pound tin of ordinary canned tomatoes [indicating].

This one I bought on the streets of Washington to-day for 20 cents a can. This one can be easily sold for 10 cents a can and it contains exactly the same food value. This is produced by expensive machinery, eliminating seeds, skins, cores, and reducing the tomato pulp from 32 ounces net, down to 6 ounces net.

Now, our Italian friend says the imported article to-day would cost them, if I remember rightly, $18.50 a case. I mention that, gentlemen, because I want to refresh your memory here about wages here in the United States and foreign countries. In February, 1921, in Florence, in Italy, there was a decrease of 1.6 per cent in the cost of foods over the previous month, but an increase of 384 per cent of the cost of food values over the first half of the year 1914. While the decrease in American foods for the previous month was 8.1 per cent, the increase over the first half of 1914 was only 55 per cent. In the city of Milan, the same comparison shows that in February of this year their food costs were 464 per cent. Therefore, if this tin costs $18 now it would cost less than $4 per case in the first half of 1914. That clearly explains why their cost now is extremely high.

Now, if we are allowed to go ahead and pack tomato paste in the United States and are granted a tariff which is just the difference in the cost of labor in Italy and the United States, we will bring the cost

of consommé and soups, ketchup, and all the condiments from which the tomato paste is made down to below the cost of 1914. But we must have a market for it, and the market that we want is to reach the Italian trade of the United States, which has solely bought this product.

Senator WALSH. The tomato paste?

Mr. MITCHELL. Absolutely. The American tradesman in the United States knows nothing about that product in the world. We have been busy supplying the Italian population, but if we are permitted to retain our expensive machinery and manufacture this and have time to build up the demand from our American trade, we will produce it inside of five years until, instead of paying 20 cents a can for the food value contained in that tin, with the saving of tin and the freight, we will be able to produce the same food value in that can for not to exceed 6 or 7 cents.

Therefore, strange to say, asking for a protection on this will have the tendency, will have the effect, of reducing the price instead of making it increase.

This year I sold more than a million tins at the price of $11.50 a case, while in 1917 it sold for $20 per case.

Senator WALSH. What was the cost to produce the case?

Mr. MITCHELL. This was my main cost, $10 per case for this [indicating].

Senator WALSH. There is a very small margin of profit?

Mr. MITCHELL. Yes, sir.

Senator SMOOT. How many cans are there in a case?

Mr. MITCHELL. Two hundred, costing 5 cents per tin, equaling in food value this 32-ounce tin that sells at retail here to-day for - cents a tin.

Senator WALSH. What does yours retail for?

Mr. MITCHELL. Eight and nine cents. Now, I have figured on this paste question how to arrive at 42 per cent. The cost of tomato paste is 66⅔ per cent labor. The average cost of labor in Italy is less than 25 per cent of the average cost of labor in the United States. Figuring on the American valuation, if we put the parity of the rate in Italy and the United States the same it would take a tariff of - per cent, or a specific tariff of 4 cents a pound.

Senator SMOOT. That can costs you 5 cents?

Mr. MITCHELL. That is right; yes, sir.

Senator SMOOT. That is labor, can, and everything?

Mr. MITCHELL. Absolutely everything.

Senator SMOOT. How much labor is in it?

Mr. MITCHELL. I estimate 66⅔ per cent.

Senator SMOOT. That would be 3⅓ cents?

Mr. MITCHELL. That is it.

Senator SMOOT. That is all the labor there is in that?

Mr. MITCHELL. That is right.

Senator SMOOT. You want 42 per cent for 3⅓ cents?

Mr. MITCHELL. Forty-two per cent, as I understand. I do not know that I understand the American valuation or not; but I understand that the American valuation means the wholesale price of American manufactures, which in this year was $11.50 a case.

Senator SMOOT. That would be $4.52?

Mr. MITCHELL. While the labor cost is $6.67 and the Italian labor is one-fifth of that.

Senator SMOOT. You say you sold that at $11.50?

Mr. MITCHELL. Sold it at $11.50; yes, sir.

Senator SMOOT. In other words, for the labor cost of 3½ cents you want protection of 2½ cents?

Mr. MITCHELL. That is it, based on American valuation; but if by some means you should drop that, give us 4 cents a pound specific, which would be $4 per case, which would nearly produce the same thing.

If you will enact this, I want you to know that what we are doing is setting the basis for food value that is contained in tomatoes, reducing the size of the container which contains it, its weight, and the amount of lumber that it takes to case and ship it. In other words, the tomato products in the United States to-day use 25,000 cars per year. If we can reduce the paste in that from 32 ounces net to 6 ounces net and have it contain the same food value, we will have saved 20,000 cars in space and material used, and we will get a product that is purer, because after the tomatoes are washed and sorted they are never touched by human hands; they are handled by machinery all the way through. We will get a purer, cleaner, and more wholesome product than these are [indicating] in the paste from which we make soup, consommés, and all of the things that enter into our foods that we use at two meals per day throughout the year.

Senator SMOOT. You will have to convince the American housewife that this is as good as the tomato itself.

Mr. MITCHELL. That is what we must do.

Senator SMOOT. That we can not help you with.

Mr. MITCHELL. But we want to use the Italian trade which consumes this commodity, and we have got the time. Up to this time it has kept us few manufacturers busy to supply that trade, and we have had no time to put the machinery in operation to prove to the American housewives why they should buy this paste instead of that can of tomatoes [indicating].

Senator McCUMBER. We are very much obliged to you.

BRIEF OF JOHN S. MITCHELL, WINDFALL, IND., REPRESENTING ROYAL PACKING CO.

1. We ask for an ad valorem duty of 42 per cent, American valuation, or 4 cents per pound, specific duty on the product containing not less than 25 per cent tomato solids and 5 cents per pound on product containing more than 25 per cent of tomato solids, covering the net contents of the package and immediate (tin) covering.

2. Cost of manufacture in the United States during the season of 1921 was approximately $10 per case of 200 tins, each containing 6 ounces net. Density of product, 25 per cent tomato solids.

3. Principal items that enter into cost being the raw tomatoes from the field, tin containers, and wood case.

4. Wholesale value, approximately $11.50 per case.

5. Imports come exclusively from Italy.

6. We are asking for protection to the extent of the difference in labor cost in the United States and Italy.

7. Labor used being almost exclusively farm labor or labor drawn from the agricultural districts. In Italy even the tin containers are made by cheap hand labor during the vacation season. The raw product (tomatoes) being very perishable, it follows that the packing of the product must be in close proximity to the farms as a matter of economy.

8. Comparative cost of labor (agriculture): United States, $46.89; Italy, $9.73 per month. (See Tariff Information, 1921, Wages in United States and Foreign Countries, p. 6.) Italian labor cost being approximately 20 per cent of the cost of American labor.

9. We estimate that fully 60 per cent of the cost of the product is labor.

10. Application of ad valorem duty asked, based on 1921 estimate of cost, would be as follows:

Total cost per case, $10; 60 per cent of which is labor, $6 per case; Italian labor cost, 20 per cent of American labor cost, or $1.20 per case. Difference in labor cost, $4.80 per case in favor of Italy. American wholesale value at time of manufacture $11.50 per case. Tariff of 42 per cent on American valuation would produce a duty of $4.83 per case and give us protection to the extent of the difference in cost of labor only.

11. Application of specific duty of 4 cents per pound on product containing not more than 25 per cent tomato solids. We estimate that when this product shall have reached an American cost of $8.50 per case we will be down to a prewar basis; 60 per cent of this cost, $5.10 per case, being labor; labor cost in Italy, 20 per cent of $5.10, equals $1.02 per case, or a difference in labor cost of $4.08 per case in favor of Italy. Weight of net contents of package, including immediate (tin) covering, is approximately 100 pounds, at 4 cents per pound, would produce a duty of $4 per case and give protection to the extent of the difference in cost of labor only.

12. Representative of Italian Chamber of Commerce advises that present cost of imported product in New York City is $18.50 per case, and for that reason the American manufacturer needs no protection. However, he fails to note that food prices in Italy are more than 400 per cent above normal. (See tariff information booklet above referred to, pp. 84-85.) With their cheap productive labor, we may expect them to reach normal very quickly, and the cost of $18.50 per case will then be $4.62½ per case, and that little $4 per case specific duty will look good to American farm labor and agriculture.

13. Product at this time is consumed almost wholly by the Italian population in the United States. American manufacturers, if given the opportunity, will educate American consumers to appreciate the advantages of tomato paste in cleanliness and great saving in cost.

14. When Italy entered the World War, the Italian Government placed an embargo on the exportation of tomato paste. American manufacturers built factories and have taken care of the demand to date.

15. Prewar prices of imports were $4.50 to $8 per case Boston, New York, or New Orleans. Domestic prices, 1916, $13 per case; $20 per case in 1917. In 1918 there was an overproduction and market during 1919 dropped below cost of production. In 1921 market for futures 25 per cent tomato solids, $11.50 per case. Present market rising, and is now $14 per case. This rise in value is because at the beginning of 1921 American manufacturers through fear of competition with cheap Italian labor cut production and started dismantling plants. It follows that had we had the protection asked for in this brief, tomato paste would be selling in the United States to-day at less than its present market value.

CHICORY.

[Paragraph 775.]

STATEMENT OF DAVID McMORRAN, PORT HURON, MICH.

Mr. McMORRAN. I am interested in paragraph 775, chicory. Under all previous tariffs chicory has been honored with a separate paragraph. I find in the present bill that it has been grouped with dandelion root, coffee substitutes, and acorns. Why, I do not know, because dandelion root, acorns, etc., are not products that are imported, or ever will be, to any extent. I filed with the House committee an elaborate brief on the subject of chicory, which evidently was not read——

Senator McCUMBER. It may be that it was too elaborate.

Mr. McMORRAN. That may be. I thought I would not prepare any brief this time, but would take about 5 minutes of your time. The bill came out of the committee giving a rate of a cent and a half on the raw materials and 2 cents on the manufactured article, which was only one-half cent protection for the manufactured and meant the absolute destruction of the chicory industry in this country. O

an eleventh-hour appeal they consented to put a rate in as it was in the Payne-Aldrich Act, 1½ on the raw and 3 cents on the manufactured.

That is not a prohibitive tariff, as you will note from the record that there was a continuous importation during the Payne-Aldrich Act. With the present tariff, which went into effect in 1914, we had about six months' experience, and it put us out of business. The war came along and saved us. This year we are hanging on. I closed my own business the 1st of July with a loss of $100,000, due to this tariff. We have another loss facing us for the next year.

Senator SMOOT. What do you want on chicory?

Mr. McMORRAN. We want the bill left alone as it came from the House. If you will do that we are going to be satisfied. That is not exactly satisfactory, but it is about the best we can hope for. We do not want to start any disturbance in the House. The present exchange conditions make a 3 cents a pound difference existing, but we can not correct it. We have not been able to discover any way of correcting it except by an additional ad valorem duty, which the House does not approve of. The difference should be 2 cents between the duty on the raw and the manufactured in order to give us protection and put us on the same basis as the foreign manufacturer. Though we would be satisfied with 1½ and 3 cents if it is allowed to stand as in the House bill. There are engaged in this business in Michigan about 10,000 farmers who grow chicory, about 5,000 every year, under normal conditions; and they do not grow it every year. It is a part of their established rotation of crops. Some years one farmer will grow it, and the next year his neighbor will grow it and he will skip a year.

Senator LA FOLLETTE. Is it all produced in Michigan?

Mr. McMORRAN. Practically all of it. There is some grown in California and some in New York. It has been grown all over the country. It has been grown in Wisconsin, Nebraska, Connecticut, and New York.

Senator CALDER. Is there much imported?

Mr. McMORRAN. Yes, sir. There is some imported all the time.

Senator CALDER. What proportion of the total consumption in this country is imported?

Mr. McMORRAN. Under the Payne-Aldrich Act from 10 to 15 per cent of the consumption of the country. That importation has run up as high as 50 per cent. With that 50 per cent we can not exist, because the business is limited.

Senator McCUMBER. It is used as a coffee substitute, is it not?

Mr. McMORRAN. No, sir; it is a coffee mixture. Your impression of chicory is probably——

Senator McCUMBER. I mean, it is mixed with coffee?

Mr. McMORRAN. Yes, sir; but it is not an adulterant.

Senator McCUMBER. It is not used for any other purpose than coffee. That is what I wanted to get at.

Mr. McMORRAN. No; nothing but coffee.

Senator LA FOLLETTE. How does it sell in comparison with the price of coffee?

Mr. McMORRAN. It varies. During the war it sold at twice the ordinary price, because we had a shortage. It is now selling at 7 cents.

Senator LA FOLLETTE. It is mixed in what proportion with coffee?

Mr. McMORRAN. About 10 per cent is all that should be used, and that is used by the coffee roasters.

Senator LA FOLLETTE. What purpose does it serve in the coffee?

Mr. McMORRAN. It makes a mellow body to the coffee which you do not get from the modern Central American and South American coffees. You remember that when we used to get one-third Mocha and two-thirds Java we got that mellow body. We do not get that any more. We get Central American and South American coffees which are lacking in body, and the addition of the chicory gives that mellowness which you get in the dining cars and in the best hotels which serve chicory with their coffee. It is not bought very largely by the consumer, only a small portion of it. We hope to educate the consumer to it. In mixing the coffee the proportion is so small that the effect in price to the consumer is negligible. It is only a fraction of a cent a pound; and coffee is never sold by split cents.

Senator JONES. Which kind of coffee does the chicory displace—Mocha?

Mr. McMORRAN. No, sir; it is more the Java. The old Java coffee was the coffee with a body, and the chicory takes the place of the Java. It requires a very small percentage to do it. You do not want to use too much of it. If the committee will simply bear in mind that the bill as it comes from the House is satisfactory, and not reduce the differential between the raw material and the manufactured we will be satisfied, because the American farmer can not export his product unless the American manufacturers use it. They must have at least 1½ cents in order to struggle through the foreign exchange difficulties, and then we will be on the basis that we were on before the war.

CHOCOLATE AND COCOA.

[Paragraph 776.]

STATEMENT OF STEPHEN L. BARTLETT, IMPORTER OF MANUFACTURED COCOAS AND CHOCOLATES, BOSTON, MASS.

Mr. BARTLETT. My name is Stephen L. Bartlett; my home is in Boston.

The CHAIRMAN. What is your occupation?

Mr. BARTLETT. I am an importer of manufactured cocoas and chocolates, buying them for my own account and paying for them and selling them at my own risk. In no sense am I a representative on a commission basis of a foreign concern.

The article I represent is a food product, unsweetened cocoa powder used in families like tea and coffee.

The CHAIRMAN. Where does this product chiefly come from that you use?

Mr. BARTLETT. The manufactured product that I deal in is manufactured in Holland. We import the goods in small tins for family consumption and in 200-pound casks for manufacturing purposes and chocolate in 100-pound cases as a raw material wholly.

I particularly ask you gentlemen not to confuse the goods I represent with what is popularly known as chocolates and which are provided for under the confectionery clause of all tariffs.

Senator McCUMBER. You import simply the raw product?

Mr. BARTLETT. No, sir; the manufactured product.

Senator McCUMBER. The manufactured product of chocolate?

Mr. BARTLETT. The manufactured product of the cocoa bean. The cocoa bean is the basis of all chocolate and cocoa preparations, and it is suitable for nothing else but the manufacture of cocoa and chocolate.

Senator McCUMBER. To what extent is the same product manufactured in the United States?

Mr. BARTLETT. I was going to refer to that in a moment, Senator, if you please.

Senator McCUMBER. All right.

Mr. BARTLETT. The cost of manufacturing is mostly by automatic machinery and is no more, or very little more, if any, in this country than in any other foreign country. Cocoa beans are on the free list, and the United States last year consumed 60 per cent of the world's consumption, the best evidence, I think, that as a protective measure the high tariff is not necessary.

The imports of cocoa beans, from which these goods are all made—and I ask you again not to confuse these with manufactured chocolates, which I was once told by a member of the Senate Finance Committee his daughter bought on F Street for a dollar a pound——

Senator WATSON (interposing). Let me ask you a question or two, Mr. Bartlett.

Mr. BARTLETT. Certainly.

Senator WATSON. I do not hear you very well. What is the duty under the present Underwood law?

Mr. BARTLETT. The Underwood tariff on prepared unsweetened cocoa powder is 8 per cent.

Senator WATSON. The bean itself is on the free list?

Mr. BARTLETT. The bean itself is on the free list.

Senator WATSON. And on the finished product 8 per cent?

Mr. BARTLETT. On the finished product, unsweetened cocoa powder, 8 per cent.

Senator WATSON. And this bill proposes 17 per cent, does it?

Mr. BARTLETT. This bill proposes 17½ per cent.

Senator WATSON. Have the imports under the Underwood law destroyed the industry in the United States or injured it?

Mr. BARTLETT. I will quote these figures in reply to you, Senator, in a moment.

The imports of beans under the present tariff, in 1913, were 139,000,000 pounds; in 1920 they had increased to 420,000,000 pounds—three times, 300 per cent.

Senator WATSON. That is the raw material?

Mr. BARTLETT. The raw material.

Senator WATSON. Are they used for any other thing?

Mr. BARTLETT. Nothing else.

Senator WATSON. Have you any figures to show how much finished product was imported?

Mr. BARTLETT. Yes, sir. Under the same tariff the imports of manufactured products for the year 1913 were 1,598,000 pounds, and in 1920 that decreased to 1,548,000 pounds. Practically speaking, the imports of manufactured products were very little, if anything, compared with the raw material of which this country consumed 60 per cent of the world's consumption.

Now, to increase the tariff as it is proposed in the House measure would stop the importations altogether.

These figures, I think, speak better than anything I can say further.

Senator SMOOT. What do you want? Do you want 8 per cent?

Mr. BARTLETT. I would prefer a specific duty.

Senator SMOOT. Of how much?

Mr. BARTLETT. A specific on unsweetened cocoa powder, valued at less than 20 cents a pound, of a cent a pound; and above 20 cents a pound, 3 cents a pound. That is about the rate of to-day.

Senator SMOOT. What do you have to say about cocoa butter?

Mr. BARTLETT. We can not compete with the American manufacturer. There is a tariff of 3½ cents a pound, which bars out Holland butter.

Senator SMOOT. You are not interested in that?

Mr. BARTLETT. We are not interested. The importation of cocoa powder has increased; the butter has become the product and the powder is the by-product.

Senator McCUMBER. Why this sudden jump of 300 per cent increase in the amount of tariff between that which sold for 20 cents and that which is sold for above 20 cents? You ask 1 cent on the one, and then you go to 3 cents or three times as much upon the other. Why that disparity?

Mr. BARTLETT. In cheap cocoa powders we can not compete with what is made in this country. On the better grades of powders we can and we are willing to pay about the rate of duty that is fixed to-day, only we ask a specific rather than an ad valorem rate.

Senator McCUMBER. What do you pay for that which you import, as a rule?

Mr. BARTLETT. The best grade of powder we use, under the present tariff, with the present rates of exchange, cost us about 40 cents.

Senator SMOOT. Take it by the barrel or in 200-pound barrels, what does that cost you?

Mr. BARTLETT. We can not compete with American-made goods which are sold here as low as 3 cents a pound; we can not bring goods in here and pay a duty unless the cost of our goods would be 10 cents and from that up—the better grade of goods.

Senator McCUMBER. Your importation is exclusively of that character which is about 20 cents a pound in price?

Mr. BARTLETT. No; we have some bulk goods which cost less; some cheap goods we import in barrels or casks. We are able to make in Europe some better grade of goods and bring them here at a price, but we can not bring them at a price to compete with American manufacture.

Senator McCUMBER. I still do not understand just why you should make such a vast increase of 3 cents a pound in tariff, where perhaps the goods themselves would not increase 2 cents a pound in value.

Mr. BARTLETT. Senator, you take a dividing line in the quality of the goods at 20 cents; you get into the better class of goods on which

e are willing to pay a better rate of duty. We can not bring in the heap goods which run down as low as 10 or 12 cents and up to 20.

Senator SMOOT. Are there any 60-cent chocolates?

Mr. BARTLETT. No; they can not bring those in. We can not ring anything here that cost as high as that to any extent.

Senator WATSON. You bring in the unsweetened?

Mr. BARTLETT. Yes, sir; the tariff prohibits the importation of weetened cocoas.

I would like to emphasize these figures which I quote you and are, I hink, my best evidence:

Imports of cocoa beans into the United States (quoted from nited States Department of Commerce), year ended June 30, 1913, 39,885,843 pounds; year ended June 30, 1920, 420,330,886 pounds.

Imports of manufactured cocoa and chocolate, 1913, 1,598,496 ounds; 1920 (includes chocolate, prepared or manufactured), ,548,973 pounds.

The imports of manufactured cocoas have increased during the ast eight years very little. The tariff is practically prohibitory, nd we ask a decrease in the tariff, not an increase as is proposed n the House bill. Home consumption has increased 300 per cent.

The CHAIRMAN. Is that all, Mr. Bartlett?

Mr. BARTLETT. That is all I have to state.

HOPS.

[Paragraph 779.]

STATEMENT OF LEVI COOKE, REPRESENTING THE ANHEUSER-BUSCH CO. (INC.).

Mr. COOKE. Mr. Chairman, I desire to discuss the question of the hops duty. The hops duty is found, I think, in paragraph 779. The situation with respect to hops is this: So far as the tariff treatment in the past has been concerned, the 1909 act placed the duty at 16 cents per pound. I understand that was considered a revenue-producing duty. The 1913 act retained the 16 cents per pound rate. The House committee and the House itself placed the rate in this bill at 24 cents per pound. The Oregon and California hops-producing interests have been in favor, of course, of a protective duty upon hops. There has been no objection, so far as I know, from the domestic consumers to a revenue-producing and a protective duty with respect to that product. But to carry the rate beyond a certain point means the suppression of importation of hops. That is particularly true to-day when the hops are used exclusively in nonintoxicating cereal beverages, and, as the committee has already had shown to them on the revenue bill, that industry is in a very struggling and difficult position. Any increase in the cost of raw material will result in greatly lessening the manufacture of those cereal beverages.

Speaking for Anheuser-Busch (Inc.), who manufacture the so-called Budweiser cereal beverage, I can state as a fact that they use all of the domestic hops that they can employ—that is, they use all the domestic hops they can and still maintain the character. There is a great difference between the hops as grown on the Pacific coast, where the center of the industry is, and the so-called Saazer or Bohemian hops, Bohemia now being a part of Czechoslovakia. A number

of grades of hops are so distinct in character and quality and flavor producing characteristics that they can be contrasted but not compared.

It occurred to me this morning in listening to the statements as to the difference between long staple cotton and short staple cotton that there was the same difference between the Saazer hops and the domestic hops. If these Bohemian hops can not be imported to this country because of the high rate, the domestic industry will decrease. In the past they were purchased by contract in Czechoslovakia. Fortunately, when the war came on Anheuser-Busch had a large supply of Bohemian hops on hand. They had ordered five shiploads, and they thought they were going to suffer a commercial loss, but at that time, when the war came on, it resulted in their having a large supply, and they were in a fortunate position.

In buying a crop abroad they analyze it, and they also analyze the domestic product, and the proportion of grades of domestic and imported grains in cereal beverage Budweiser is based not on a strict formula as to so much foreign and so much domestic, but a resultant according to the analyses of the two kinds of hops in different crops.

For some years the proportion of the domestic and imported in average use has been about 3 pounds of hops to 100 pounds of beverage, and the average proportion is half imported and half domestic.

To place a duty of 24 cents a pound instead of 16 cents is, in their opinion, to impose an almost insuperable burden upon that raw material. They can not abandon the use of the foreign hops without destroying the beverage.

So far as the domestic hops situation is concerned, I understand our average crop is about 35,000,000 pounds, more than half of which goes abroad. Under present conditions American hops are very largely used in England and in Canada, and in view of the fact that the importation now comes in at the rate of a million pounds a year we do not think the domestic industry can be hurt at all by leaving the duty where it now is. They import no more to-day than has to be imported. The price of domestic hops being 25 cents a pound when Saazar hops are 80 cents a pound, the economic conditions are such now that no man buys a pound of foreign hops unless he is driven to it.

Senator McCumber. Inasmuch as the British ales generally have a reputation for quality, why is it they use the American instead of the Bohemian hops?

Mr. Cooke. For exactly the same reason that Anheuser-Busch uses half of its supply in domestic hops. The British grow a larger crop of hops than Bohemia does. They get a certain quality from their own hops and a certain flavor from the Saazar hops. They buy the cheap American hops and use the Bohemian hops for the flavor.

Senator Walsh. Like the use of Egyptian tobacco in cigarettes?

Mr. Cooke. Yes, Senator. I was trying to think of something to compare it to and that is just a case in point.

Senator McCumber. Why should it cost three times as much to raise the Bohemian hops as the American hops?

Mr. Cooke. The only explanation I have ever had is that the price of those hops is much higher than the price of any other hops. In Bohemia the monetary situation to-day is better than that of a

other European country, and costs are high. They have about one-tenth of the world's production in hops in Bohemia. We have more than half. England has 15 per cent in round numbers.

Senator WATSON. What has been the difference in the consumption of hops on account of prohibition?

Mr. COOKE. It is greatly reduced.

Senator WATSON. Can you give the percentage of the proportion?

Mr. COOKE. I can not. Hops are used in the production of cereal beverages and the demand is not so great as it was before prohibition.

Senator WATSON. They do not use as many hops in making cereal beverages as in making beer?

Mr. COOKE. More.

Senator WATSON. Then they really did not put any hops in beer?

Mr. COOKE. Oh, yes, sir; but, as I stated when we discussed the revenue bill, it takes more materials of all kinds to make a cereal beverage than to make beer. You have got to make beer with all the materials, and in Anheuser-Busch's process they break that down and restock the dealcoholized material with more raw material.

Senator WATSON. I understand that. I was trying to get at the relative quantity of hops in beer and cereal beverages.

Mr. COOKE. Fifteen per cent more hops are used in Anheuser-Busch's plant to make cereal beverages than was used in making beer, but the total production is so greatly less than the total production of alcoholic beer that the total amount of hops used in the country is greatly reduced. But if Anheuser-Busch can not get the imported hops they can not maintain the standard of Budweiser as to flavor and character and they would stop using their production, and every time they reduce their production they reduce the consumption of domestic hops.

Senator WATSON. You say 15 per cent was the revenue-producing tariff?

Mr. COOKE. Sixteen cents a pound. I understood that was a revenue-producing tariff rather than a protective tariff, because the price of domestic hops has always been from a half to a third of the imported hops. No man would buy imported hops unless he had to in order to maintain the standard of his product.

Senator SMOOT. We have always exported half or more than half of the American product.

Mr. COOKE. Yes; our hops industry has always been an exporting industry, and the rest of the world is dependent upon America for hops, but we import Saazar hops because we have got to have them; and the institution I speak of has lost a great deal of money in maintaining its industry during the past three years.

Senator SMOOT. What you want is the 16-cent rate?

Mr. COOKE. We think that ought to be preserved, and we feel, as Mr. Busch said, that if it is necessary to protect the American industry by a rate of 24 cents he would be for it; but it would be ruinous to Anheuser-Busch to add another $50,000 or $60,000 a year to their losses.

We are struggling to pay that 2 cents per gallon and continue to make cereal beverages in order to pay it.

Senator WATSON. What do you think about the hops extract?

Mr. COOKE. I understand that duty is unimportant. I asked them if there was any criticism, and they said no, and I am not prepared to discuss that.

STATEMENT OF HON. WESLEY L. JONES, UNITED STATES SENATOR FROM WASHINGTON.

Senator JONES of Washington. The tariff on hops is placed at 24 cents a pound in paragraph 779 in the House bill. I do not know whether that matter has been presented to the committee or not.

Senator SMOOT. Yes; it has.

Senator CURTIS. We had a hearing on it.

Senator JONES of Washington. The people out in my section urge 32 cents a pound; and I have here a very strong letter with reference to it. I think it has been covered in the record; but probably I had better file the letter with the stenographer to be embodied in the record.

Senator MCCUMBER. We have testimony also urging that all tariff be removed from it.

Senator JONES of Washington. I suppose so.

Senator MCCUMBER. I think that testimony was from the Anheuser-Busch Co.

Senator JONES of Washington. Yes; I suppose so.

Senator MCCUMBER. If I remember rightly, they claim that they can not use more than a certain portion of the American hops.

(The letter referred to is as follows:)

YAKIMA, WASH., *April 16, 1921.*

Hon. WESLEY L. JONES,
United States Senator for Washington.

DEAR SIR: In reply to your favor of the 4th instant, the matter has been presented to Mr. Hawley and we also have had our Mr. J. W. McNeff talk to him but Mr. Hawley apparently does not wish to present matters according to the actual conditions, but on the other hand wants to go into matters entirely outside the points to be considered.

The hop situation is a condition—due to only one thing—excessive dumping of imported hops into this country, the amount being three times that of before prohibition laws were enacted (when American brewers consumed 23[illegible]000 bales) whereas the consumption now has declined 65 per cent.

Mr. Hawley says it is necessary to know the costs of producing foreign hops to get at the matter and ignores the points we make. We do not understand what the costs of foreign goods has to do in the matter, and for the reason to go into the cost of foreign hops would only be a guess at best, because of the fact that continental hops are not handled as ours. Their hop farms are generally an acre or so, handled by one family. The hops are bought at the farm and taken to a dealer's warehouse to be dried and baled. In our case the farms run up to 400 or 500 acres, employ hundreds of people, and the goods are dried, baled, and put up for market by the farmer, and [illegible] farmers bear the entire cost up to then. The foreign grower stops on [illegible] cost at harvest time, so you will see there is a wide difference in the handling and no way of making a comparison. The American farmer's investment, his outlay and his hired help is much greater than the foreign farmer. As you know there also is no comparison between wages paid farm laborers in Europe and here.

The main point outside of the excessive dumpings to be brought out [illegible] which really is the key to the entire situation is this: All continental traders sell, and American brewers buy, on the theory that one pound continental hops equals two or three pounds of American hops in brewing value. This is the reason why brewers pay more for foreign hops, and it has been the case for 50 years and more, acknowledged and accepted by everyone as a trade [illegible]. The foreign trader claims this on the ground that their hops are all from female vines (which contain practically no seeds), sun cured, and that the hops are repicked (taking out all stems and leaves), whereas the American hop does contain seeds (as all yards contain some male vines), also [illegible]

and stems and are kiln cured. When you stop to consider that 90 per cent of the American brewers are from Continental Europe, where imported hops come from, you will readily understand how useless it would be to try to overcome the feelings of such people as to the merits of American hops and their home grown goods, the matter is not argued but accepted and let go at that.

Basing the matter on the plan that 1 pound of foreign hops equals 3 pounds of domestic, as bought and used, you will see that the dumpings into this country has taken the place of 93,000 bales of Americans, for it would be figured 3 times the amount imported (31,000 bales); also on this ratio of 1 to 3, imported hops are in reality not paying a 16-cent duty, but one-third of 16 cents (5⅓ cents). This is actually the way it would figure out to the continental importer as seller and the American brewer as buyer.

When we ask that the duty be increased to 32 cents, we are simply cutting the ratio of continentals down to a ratio of 1 pound of same to equal 2 pounds of domestic, when as a matter of fact there are more brewers using foreign hops on the ratio of 1 pound to 3⅔ pounds domestic than 1 to 2 pounds, so it is a very reasonable advance to ask for.

If the continental traders and importers were accorded the same consideration as they showed for the American farmer an embargo on their hops would not be out of line, for they dumped the equivalent to what they formerly shipped into this country—over a three-year period—in normal times at that.

Mr. Hawley says the question has been raised that if a 32-cent duty is put on that same would mean a guarantee of this price to the American grower for his hops. This is not so and has been proven to not be the case, for when the war was on and no imported hops were available, while the duty at that time was 16 cents, yet hops at times were as low as 4 and 5 cents. The question of what hops will sell for with a 32-cent duty will entirely depend on what this country produces, the amount exported to England, and what the American market will absorb. If we do not have a high enough duty to prevent excessive importations then we are bound to have a surplus, as the case this year, leaving farmers with upward of 30,000 to 40,000 bales on hand and their next crop coming on them.

Importers and users have no reason to complain, for they have put over something this year they could not do in a free-trade port—England. The Government in England stepped into the breach on the ending of the war and went so far as to put a complete embargo on all foreign hops. This embargo is still on and will remain until the entire English crop is bought and paid for by English brewers. When that is done, then the controller is open to consider granting permits to import American and other foreign hops. That proceeding, in our opinion, is real protection, and it was accomplished promptly and with no hearings, agreements, or anything. They simply figured for their country's interests first, and this should be the case with the American plan.

We would like to have you take this matter up personally and handle with the committee in charge, bringing out the points we have made.

If there is anything you wish to know further, wire or write us.

Yours, faithfully,

McNeff Brothers.

MUSTARD AND MUSTARD SEED.

[Paragraph 780.]

STATEMENT OF FRANCIS J. FRENCH, REPRESENTING THE AMERICAN SPICE TRADE ASSOCIATION.

The Chairman. Your name is George F. French?

Mr. French. My name is Francis J. French, substituted for George F. French by appointment of the American Spice Trade Association. I was appointed by the association to speak on mustard, paragraph 780, and Mr. J. S. Murphy, of Boston, was appointed to speak on the other items of this paragraph.

Senator McCumber. His name does not appear on the list of witnesses.

Mr. French. It was put on there yesterday, Mr. Chairman.

Senator McCumber. You want to divide the time with him?

Mr. French. Yes, Mr. Chairman. I will make a short statement and yield my time to Mr. Murphy if that is satisfactory to the committee.

Senator McCumber. That will be satisfactory.

Mr. French. The American Spice Trade Association requests that the tariff be 10 cents per pound upon ground mustard or mustard flour and prepared mustard, and that mustard seed be free, or if it be deemed necessary to place a duty upon mustard seed, that the duty upon ground mustard or mustard flour and prepared mustard be 10 cents per pound, plus twice the duty which is placed upon mustard seed.

Under the Payne-Aldrich Act, prior to October 4, 1913, the tariff upon so-called ground mustard was 10 cents per pound, and mustard seed was free. From October 4, 1913, until the present, under the Underwood tariff the duty on so-called ground mustard has been 6 cents per pound, and mustard seed has been free.

Unfortunately prepared mustard and so-called ground mustard in both these tariffs were listed together under the name "mustard, ground or prepared, in bottles or otherwise," and therefore the exact figures of each can not be given. The imports have been as per schedule attached, which shows the imports for each year since 1908, but it is common knowledge in the trade that the imports of prepared mustard have declined, and that the import of mustard flour has increased. The small imports during the year 1918 were due to the fact that Great Britain had placed an embargo on the exportation of mustard flour.

Even under the protection of 6 cents per pound, to the American manufacturer, the import of mustard flour has steadily increased, and we believe that they are greater so far in 1921 than they have ever been.

We can not believe that it was the intention of the House of Representatives to cut our protection in half, but that is just what the proposed bill will do. Our present protection is 6 cents per pound because mustard seed is free. The proposed bill by placing a tax of 1 cent per pound upon whole seeds, will actually make the mustard made from those seeds cost 2 cents per pound more, and as the proposed duty upon ground mustard is 5 cents, it leaves us a protection of 3 cents instead of 6 cents as at present.

We believe those in charge of this product in the Ways and Means Committee thought that the mustard seeds were ground entire like pepper and other spice, and therefore proposed the duty of 5 cents per pound as in the case of other spices. But this is not so, and the so-called ground mustard costs approximately over 2 cents per pound for each increase of 1 cent in the cost of the seed.

The reason for this extra cost is that mustard seed consists of about 30 per cent bran, which is worthless, and practically all of which is removed in the process of manufacture. Also, by one process, approximately 20 per cent of bland oil is removed. In removing the hulls of the mustard, unavoidably some flour is also removed, and the average yield of flour is not much over 50 per cent, which with the labor ...

volved, makes the extra cost something over double the price of the seed.

The proposed duties would be a very serious matter for the American manufacturers, and it will surely encourage the importation of foreign-made mustard flour.

We wish that prepared mustard and mustard flour could be listed separately in this tariff, and that the schedule for the dry mustard should read "ground mustard or mustard flour," for the reason that the Bureau of Chemistry has issued, in Circular No. 136, a list of definitions by which they seek to make a difference between ground mustard and mustard flour, which have always up to the present been used as synonyms. It is, we believe, a useless distinction and will cause confusion. The product which is manufactured in England and which is imported is not ground mustard within the meaning of the definitions of the Bureau of Chemistry, but is mustard flour, and there has not, as far as we know, ever been any such substance as ground mustard imported or even made and sold as a condiment, and if it were made it would be a decidedly inferior article. Attached are the definitions as published in Circular No. 136 of the Department of Agriculture.

Practically all of the dry mustard imported into the United States is the product of one English manufacturer. Formerly there were several manufacturers, but this one house has gradually acquired and absorbed the others. They have a considerable advantage over the small American manufacturers, because of their age, wealth, size, and the fact that they have access to the best mustard seeds grown right near at hand, and also because they have cheaper labor in manufacturing an article in which labor is an important element of cost.

American manufacturers can and do make equally good mustards, but even under the 10-cent protection our growth was slow, and under the proposed protection of only 3 cents we fear it will cease.

We can not make mustard to compete in quality with the English flour without English mustard seeds. No other quality will do.

The amount raised on the average in the United States is very small. Stimulated by the exceedingly high prices of 1917 and 1918, California raised an unusually large crop in 1920, but its average production does not probably exceed 1,000,000 pounds per year, and that is all raised in one small valley, but California grown seed will not produce a quality to compete with English grown seed.

I have here a list of the imports of mustard seed from 1908 with the average value per pound, also the imports of mustard ground or prepared for the same period with the average value per pound and the ad valorem rate for each year, equivalent to the duty of 6 cents per pound since 1914 and 10 cents per pound for the five years prior to 1914. This shows that for the five years prior to 1914 the ad valorem equivalent was 38 per cent; for the next five years, 1914, 1915, 1916, 1917, and 1918, the average ad valorem was 19.4 per cent; and for the last two years it is only 11.7 per cent.

A tariff of 1 cent per pound on mustard seed, based upon the import of 1920, would yield $90,633, but inasmuch as a tariff of 1 cent per pound upon whole seed would cost the manufacturer an equivalent of cents per pound, when the product eventually reached the consumer it would cost 4 cents per pound extra for each 1 cent per pound

of revenue raised, owing to the necessary profits and distributing costs, and the injury would be serious to the American manufacturer, and would gradually, we fear, turn over our entire market on the high quality mustards to the English manufacturer, and we respectfully ask your consideration of our request, that the tariff upon ground mustard or mustard flour and prepared mustard be 10 cents per pound and that mustard seeds be free. Or, if it seems wise to place a tariff upon mustard seed, that the tariff upon mustard flour be 10 cents per pound, plus twice the amount of the tariff placed upon mustard seed.

I submit this list of the imports of mustard seed and mustard ground, as a part of my testimony, and also submit the definitions of Circular No. 136.

Senator McCUMBER. They may be printed as a part of your testimony.

(The documents referred to are as follows:)

	Mustard seed imports.	Average value per pound.	Imports of mustard, ground or prepared.	Average value per pound.	[illegible]
Tariff, 10 cents per pound, fiscal year—	*Pounds.*		*Pounds.*		Per [illegible]
1909	8,872,575	$0.038	1,743,218	$0.256	[illegible]
1910	9,124,305	.041	1,185,628½	.254	[illegible]
1911	8,512,475	.035	1,360,080	.26	[illegible]
1912	12,198,171	.034	1,400,049½	.306	[illegible]
1913	12,719,682	.033	1,433,118¾	.268	[illegible]
Tariff, 6 cents per pound, calendar year—					
1914	11,026,833	.0398	1,562,696	.2717	[illegible]
1915	10,037,255	.0629	1,369,079	.2863	[illegible]
1916	15,166,537	.053	1,635,909	.32	[illegible]
1917	14,387,262	.0726	1,813,653	.2914	[illegible]

1919	14,226,213	.0886	1,500,358	.5312	[illegible]
1920	9,063,335	.1051	1,566,258	.4930	[illegible]

DEFINITIONS OF CIRCULAR 136.

33. Mustard seed is the seed of Sinapis alba L. (white mustard), Brassica nigra (L.) Koch (black mustard), Brassica juncea Hook f. et Th., or varieties or closely related species of the types of Brassica nigra and Brassica juncea.

Sinapis alba (white mustard) contains no appreciable amount of volatile oil, contains not more than 5 per cent of total ash nor more than 1.5 per cent of ash insoluble in hydrochloric acid.

Brassica nigra (black mustard) and Brassica juncea yield 0.6 per cent of volatile mustard oil (calculated as allylisothiocyanate and determined by the method [illegible] in Service and Regulatory Announcements, Chemistry 20). The varieties and species closely related to the types of Brassica nigra and Brassica juncea yield not less than 0.6 per cent of volatile mustard oil similar in character and composition to the volatile oils yielded by Brassica nigra and Brassica juncea. These mustard seeds contain not more than 5 per cent of total ash nor more than 1.5 per cent of ash insoluble in hydrochloric acid.

34. Ground mustard is the powder made from mustard seed and conforms to the standards for mustard seed.

35. Mustard flour is the powder made from mustard seed with the hulls largely removed and with or without the removal of a portion of the fixed oil. It contains not more than 1.5 per cent of starch, nor more than 6 per cent of total ash.

36. Prepared mustard, German mustard, French mustard, mustard paste, is a paste composed of a mixture of ground mustard or mustard flour, with salt, a vinegar, with or without spices or other condiments which do not simulate the color of yellow ground mustard. Calculated free from water, fat, and salt, it contains not more than 24 per cent of carbohydrates (calculated as starch), not more than 12 per cent of crude fiber, nor less than 5.6 per cent of nitrogen derived solely from the materials be named.

SPICES, SEEDS, AND HERBS.

[Paragraph 780.]

STATEMENT OF JAMES S. MURPHY, BOSTON, MASS., REPRESENTING THE AMERICAN SPICE TRADE ASSOCIATION.

Senator McCUMBER. You may state your name.

Mr. MURPHY. My name is James S. Murphy. I am president of Stickney & Poor Spice Co., of Boston.

Senator SMOOT. You are going to speak to paragraph 780?

Mr. MURPHY. Yes, sir. A few weeks ago I wrote a letter concerning this tariff. At that time I did so independently. Some weeks ago I was selected by the American Spice Trade Association to represent them on spices, seeds, and herbs generally, outside of what Mr. George F. French would say. Mr. French is the largest manufacturer of mustard in this country. I regret that he is not well to-day.

My subject will not take much time. I think it will save some expense to the Government—it certainly will save some expense to us and to our customers—to call your attention to a few items in the tariff as it now stands. Take fenugreek seed, rape seed, hemp seed; they are not mentioned. Where they are not on the free list they should pay 20 per cent, like other seeds. Particularly is that true of fenugreek seed, which three weeks ago sold at 1 cent a pound, a week later at 2 cents, and is now selling at 3. It is largely used in the western country in the making of sausages. If these goods are not to be on the free list, as they are low-priced goods, we would rather pay a higher duty than to have a per cent duty, because of the trouble and anxiety that has always been. They have always been grouped with other seeds paying in the neighborhood of half a cent to a cent a pound. That would be a good deal more than 20 per cent on the low-priced goods.

Marjoram, savory, and thyme are not mentioned. These are herbs. They ought to be classed as such, or we are going to have trouble. There is not a man in the United States that the Government can employ that can differentiate in the quality of any of those goods. Take laurel leaves. To-day they are selling for 2 cents a pound, and 2½ up to 4½. It all depends on the type of the laurel leaf and the size of the bale and the color of the leaf. If the bale is small, 50 to 100 pounds, they are worth more than a large bale of 300 pounds. If the leaf is bright, they are worth more than the darker and poorer colored. If they are small and regular in size, they are worth a good deal more. There is not a man in the United States competent to appraise such goods.

Under the circumstances, the same is true to a lesser degree of thyme and savory. Some are worth 6 cents, some are worth 12. They are not mentioned. Therefore, they come under paragraph 32, or else they would be on the free list. Under paragraph 32 there would be a duty of 10 per cent.

We don't want a percentage duty on those materials, because there is no need of it, and because there is no proper appraiser to appraise the real value of the goods.

There are some very strange things in this tariff law, and it has excited more comment in our line of trade than anything else, be-

cause we are interested. Turmeric is taxed 10 cents a pound. The value of those goods the morning before this tariff was issued was 4 cents a pound. Therefore, the duty imposed is 250 per cent. At that time you could buy the goods landed in New York or Boston at 3 cents. Immediately the price went up. What was 4 cents in two days was 6 cents, then 6½, and then 7½. But there was a day of reckoning. The English sold them the goods, and the goods cost them 3¾ and 4¼, and those goods in America have gradually slid down to 5½. Now, these goods are taxed 250 per cent, or 300 per cent, if you take the first price on landing from London. Turmeric has always been on the free list, never was any place else. It is strange, to say the least, and it certainly enabled men in New York and men in London to later take advantage and send their goods over and take profits they never deserved.

That article is sold just at this time of the year. We do not get an order now from any wholesale grocer at this time of the year, when preserving and pickling, and the like are being done, that we do not get an order for 10 to 15 boxes. Turmeric is put up in a 2-ounce can. Every housewife uses it in piccalilli and chowchow, and for other purposes. It is used as they use Spanish paprika, principally for the looks of it.

Again, turmeric is the basis of curry powder. Prior to the war curry powder was made in India, under British supervision. During the war our people went into it and several are making it. So many are making curry powder that last year all that was imported into this country was 41,000 pounds. If you put a 2-cent duty on curry powder all you can collect is $800 on the whole imports, if they do not increase over last year. It is not worth the clerk hire.

Some people use 30 per cent of turmeric in curry powder, and some as high as 40 and 45. It is visible to you that curry powder taxed 2 cents a pound in this tariff is taxed a good deal less than 10 per cent when the raw material that makes the goods is taxed 250 per cent. Such things do not appeal to our association. We do not want to be crushed out, even in the small business of curry powder. There is no income for you, unless there is a good deal more imported than was imported last year, at 2 cents a pound. There will only be $800 total collections.

Now, on the question of mustard, my friend Mr. French is not well and could not be here. He is represented by Mr. Francis French. Mr. French is a large operator. I thought he would talk to the point. He would if he could.

The situation in mustard is simply this. I don't want to take your time. I know you are busy men. Mustard has always had some protection. The best mustard in the world grows in England. It is grown in those low counties, like Essex and Cambridge, all through the eastern counties, and it is the best mustard in the world. To compete with those men we have been obliged to buy English mustard, and we buy it at a disadvantage. The man on the spot always has a great advantage.

Then again, they have had the mustard business of the world for practically a thousand years, and they sell a large quantity of mustard in other countries and always have. Every year with a tax of [illegible] cents a pound their sales to this country have been large, until [illegible]

second year of the war, when they reduced a little because of the situation at that time. Ten cents a pound never deterred them from sending their goods into this country. Their sales increased all the time. Their profits are tremendous. They get 78 cents a pound for the best grade of mustard, and they get 58 cents a pound for the second grade, in 6-pound cans. There is not a good-sized mustard nanufacturer in this country that would not be delighted to sell the same mustard for 27 cents—less than half. It is simply because we ire fighting against prestige, we are fighting against a good reputation built up during these many years, fighting against the fashionable groceryman who sells nothing but imported goods and gets whatever price he sees fit to ask. They have always got twice what we have got ind their mustard is no better.

During the Civil War the mustard of our American manufacturers became better, and naturally the sales of our mustard were much arger because the people recognized the quality of it as being equal o the foreign mustard, and they could get it for less than half the rice. Under such circumstances, if you cut off a duty on mustard, ou are simply adding to the excess profit that is already reaped by hese foreigners, whether they are Frenchmen or Englishmen. You re simply giving them a present of so much money. They will sell oods in this country always, because certain people will always prefer o pay the extra price.

Senator SMOOT. Do you suggest an increase in the rates provided y the House?

Mr. MURPHY. We would like it left as it was. We did not want ny change. If we had the old 10 cents a pound in the Payne-ldrich bill we would be content, but if you are going to put a duty n mustard seed of 1 cent a pound, that means 2 cents on our mustard our, because we can only get 50 per cent or a little less of flour out f the seed.

Senator SMOOT. This bill gives you mustard, ground, prepared in ottles or otherwise, 5 cents a pound.

Mr. MURPHY. Mustard ground is a good deal better mustard.

Senator SMOOT. You think that ought to be 10 cents a pound?

Mr. MURPHY. I think that ought to be 10 cents a pound. If you e going to put a duty on mustard seed, you ought to give us also uble what the duty on the mustard seed is, because we can only t 50 per cent of flour out of it.

These are anæmic times in business. We can not any of us in is country afford to carry a handicap. We need crutches for a w years longer. Please give us as good a chance for salvation as had in past tariffs.

SCHEDULE 8.

SPIRITS, WINES, AND OTHER BEVERAGES.

DISTILLED AND FERMENTED LIQUORS.

[Paragraphs 802 and 803.]

STATEMENT OF LEVI COOKE, WASHINGTON, D. C., REPRESENTING WINE AND SPIRIT IMPORTERS.

The last item I will discuss is paragraph 802, the entire subject of distilled spirits and wines and liquors. The House bill has increased the rate on distilled liquors to $5 per proof gallon, as against the Underwood rate of $2.60 per proof gallon. Paragraph 803 provides for "champagne and all other sparkling wines, $6 per proof gallon," and there are other changes and increases on still wines from the present rate.

The entire subject falls under one principle, and I will not take the time to discuss the several different items and various rates that have been increased, because if the principle is sound I think the existing rates in all items ought to stand. If that principle is not sound, of course Congress can fix the rate. That principle is simply this, that the import rates are coupled with the internal-revenue duty, so that the imported product not only pays the import duty, but also the internal-revenue tax.

Senator SMOOT. That has been the case in all of our tariff and internal-revenue legislation.

Mr. COOKE. There was a time when we did not pay internal-revenue duties.

Senator SMOOT. That has been a long time.

Mr. COOKE. That was prior to the war. I remember the legislation of 10 years ago, which did not do so. Now, take the case of cognac, which has always been used for medicinal purposes——

Senator WATSON. This bill absolutely prohibits all liquors of every kind.

Mr. COOKE. Speaking first of the first Volstead Act, that forbade the importation for beverage use. The Willis-Campbell Act provided that wines and spirits should not be imported unless the prohibition commissioner should find that there were not sufficient domestic wines and spirits to meet the requirements. There is some question as to whether that means all wines or only particular kinds of wines should be imported.

The eighteenth amendment contemplated only the prohibition of beverage wines and liquors coming into the United States. If a man is sick and has got to have champagne the law leaves the door open for him to get the champagne, and I will say to the committee in that connection that when Mr. James D. Maher, the clerk of the Supreme Court, was operated on and dying in Georgetown Hospital they kept him alive a week by the use of champagne.

Conceding it is legally possible to import these wines, we come to the question of whether or not those medicinal liquors ought to be taxed so high a rate as $8.20 per gallon. Of course, none of them can be imported for anything but medicinal use.

Senator SMOOT. But the internal revenue rate before was very much higher than it is now.

Mr. COOKE. But it was then possible for gentlemen who were not ill to get that product.

Senator SMOOT. And they paid for it.

Mr. COOKE. Undoubtedly they paid for it.

Senator SMOOT. The rate was $6.40.

Mr. COOKE. They realized that was not the proper rate on medicinal liquors and left the rate at $2.20 when the internal-revenue act was passed. What is brought in now is purely for medicinal purposes and it should not be taxed a prohibitive rate. If it is brought in for a legitimate use, then the sick in the hospitals ought not to be made to pay a prohibitive tax to the Government; if it be medicinal it ought to come in free. If it must be taxed, it should be taxed a reasonable rate and should not be taxed at so high a rate that the poor sick man in the free hospital can not be given the thing which might save his life.

Senator SIMMONS. This French brandy can only be imported for medicinal purposes?

Mr. COOKE. Yes, sir.

Senator SIMMONS. And the only spirituous liquors that can be imported are for that purpose?

Mr. COOKE. Yes, sir; that is right.

Senator SIMMONS. I understand your argument to be this, that when we are dealing in the revenue bill with spirits for medicinal purposes we should differentiate in favor of those spirits in the tax?

Mr. COOKE. Yes, sir.

Senator SIMMONS. And make it only $2.20 as against $6.40?

Mr. COOKE. That is right.

Senator SIMMONS. Your idea is that we ought to follow up the same line of differentiation?

Mr. COOKE. Yes, sir.

Senator SIMMONS. And that as everything that comes in can only come in for medicinal purposes, we ought not to impose as high a rate as was imposed for liquors coming in to be used as a beverage?

Mr. COOKE. Yes. I want to say this, in conclusion, Senator, that it is true that the rules are very rigid now regarding importation. Under the administrative Willis-Campbell Act only the wholesale druggists can deal within the country in these products and the retail druggists distribute them to the people, and that means that the price is very high. A druggist always charges more than other people for the same article. You can buy pills in a grocery store much cheaper than you can in a drug store—the same pills. Therefore, it seems to me that this will not be a revenue producer under any circumstances to the Government, and therefore it seems to me that spirits that come in for medicinal purposes should come in as low as possible in order to be of any benefit to sick people.

Senator WATSON. You are asking for the rate which is in existence now?

Mr. COOKE. Yes, sir. I was not instructed to complain of the present rate, though you might as well take that off, but I was instructed to urge the committee not to increase these rates, and I trust they will not be increased, in the interests of those who are suffering from disease.
